M. Buffon obſerves (See Smellie's Tranſlation, vol. i.) that the ſurface of the earth is divided, from one pole to the other, into two belts of land, and two of ſea. The firſt and principal belt is the ancient Continent, the greateſt length of which is a line commencing at the moſt eaſtern point of the north of Tartary, and extending from thence to the neighbourhood of the gulf of Linchidolin, where the Ruſſians fiſh for whales, from thence to Tobolſki; from Tobolſki to the Caſpian ſea; from the Caſpian ſea to Mecca: from Mecca to the weſtern part of the country inhabited by the Galli in Africa; from thence to Monoemuci, or Monomotapa; and, laſtly, to the Cape of Good Hope. This line is about 3600 leagues in length (each league being about 2000 or 2100 fathoms long, and about 27 of them making a degree), and is never interrupted but by the Caſpian and the Red Seas, which are of inconſiderable breadth. This greateſt length of the Old Continent forms a diagonal line; for, if meaſured by a meridian, it will appear, that from the northernmoſt point of Lapland to the Cape of Good Hope, exceeds not 2500 leagues; and that this line, though ſhorter, meets with greater interruption from the Baltic and Mediterranean. With regard to all other lines which could be drawn under the ſame meridians in the Old Continent, they muſt ſtill be ſhorter than thoſe above-mentioned. *E. G.* From the moſt ſouthern point of the iſland of Ceylon to the northernmoſt coaſt of Nova Zembla, the diſtance is 1800 leagues. Thus alſo, if the Continent be meaſured by lines parallel to the equator, its greateſt length, without much interruption by ſeas, will ſtretch from Treſana, on the weſt coaſt of Africa, to Ninpo, on the eaſt coaſt of China, which is about 2800 leagues. Another line may begin near Breſt, and extend to the coaſt of Chineſe Tartary, which will be nearly 2300 leagues. From Bergen in Norway to the coaſt of Kamtſchatka the diſtance is only 1800 leagues. All theſe lines are much ſhorter than the firſt. Hence the greateſt length of the Old Continent extends from the eaſtern point of Tartary to the Cape of Good Hope, and is about 3600 leagues. This line may be conſidered as the middle of the ancient Continent; for in meaſuring the ſurface on each ſide of it, M. Buffon found, that, on the left there are 2,471,092$\frac{3}{4}$ ſquare leagues; and on the right, 2,469,687, which two lines differ only by 1405$\frac{3}{4}$ leagues, or barely 1$\frac{1}{2}$ degree ſquare. Hence the Old Continent contains about 4,940,780 ſquare leagues, which is not one fifth part of the earth's ſurface, and may be regarded as a large belt of earth, with an inclination to the equator ſomewhat more than 30 degrees.

The New Continent is another belt of earth, the greateſt length of which may be taken from the mouth of the river Plata to the lake of the Aſſiniboils. This line paſſes from the mouth of the river Plata to lake Caracara; from thence to Mataguais, Pocona, Zongo, Mariana, Morua, St. Fé, and Carthagena; then it paſſes through the gulf of

Mexico to Jamaica and Cuba; from thence along the peninſula of Florida, through Apalache, Chicachas; and from thence to St. Louis, Fort le Sueur; and terminates in the country bordering on lake Aſſiniboils, the extent of which is unknown. This line is interrupted only by the gulf of Mexico, is about 2500 leagues in length, and divides the New Continent nearly into two equal parts; that on the left containing 1,069,286$\frac{5}{6}$ ſquare leagues, and that on the right 1,070,926$\frac{1}{12}$; the difference of which is 1639$\frac{3}{4}$, or ſcarcely 1$\frac{1}{5}$ degree ſquare. This line is the middle of a belt of land, called the New Continent, and is inclined to the equator ſomewhat leſs than 30°, but in an oppoſite direction to the former; for that of the Old Continent extends from the N. E. to the S. W.; but that of the New Continent from N.W. to S. E. The ſuperficial contents of the Old and New Continents are about 7,080.993 ſquare leagues, *i. e.* not near a third part of the ſurface of the globe, which contains 25,000,000 ſquare leagues. Of theſe lines which divide the Continents into equal parts, it may be remarked, that they both terminate at the ſame degrees of N. and S. latitude; and that the two Continents make mutual advances, or projections, exactly oppoſite to each other; *viz.* thoſe on the African coaſt, from the Canary iſles to Guinea; and thoſe of America, from Guiana to the mouth of the Rio-Janeiro. It appears, therefore, that the moſt ancient lands on the globe are thoſe which extend from 200 to 250 leagues on each ſide of the two lines above deſcribed.

Agreeably to this idea, it is found that, in the Old Continent, the moſt ancient countries of Africa are thoſe which ſtretch from the Cape of Good Hope to the Red Sea and Upper Egypt, and are about 500 leagues broad; and, conſequently, that the whole weſtern coaſt of Africa, from Guinea to the ſtraits of Gibraltar, are new lands. In the ſame manner, if we trace this line through Aſia, and include an equal breadth, we ſhall find, that the moſt ancient countries are, the two Arabias, Perſia, Georgia, Turcomania, a part of independent Tartary, Circaſſia, part of Muſcovy, &c.; and, of courſe, that Europe, and perhaps alſo China, and the eaſtern part of Tartary, are comparatively new countries.

In the New Continent, we ſhall likewiſe find, that Terra Magellanica, the eaſtern part of Brazil, of the country of the Amazons, of Guiana, and of Canada, are new lands, when compared with Tucuman, Peru, Terra Firma, the iſlands in the gulf of Mexico, Florida, the Miſſiſippi, and Mexico. Moreover it may be obſerved, that the Old and New Continents are nearly oppoſite to one another. The Old Continent extends farther north of the equator than ſouth; but the New, farther ſouth than north. The centre of the Old Continent lies in the 16th or 18th degree of N. latitude; and the centre of the New Continent lies in the 16th or 18th degree of S. latitude; as if they were intended to counterbalance each other. Beſides, both continents reſemble one another in this reſpect that they might be divided into two portions, which would be ſurrounded on all ſides by the ſea, except the two ſmall iſthmuſes of Suez and Panama.

It is obſervable that the prodigious chains of mountains in theſe two continents run from W. to E. in the Old Continent, and from N. to S. in the New. In the Old Continent there are about 430 rivers which directly fall either into the Ocean, or into the Mediterranean and Black ſeas. But in the New Continent we know only of 135 rivers which fall immediately into the ſea. Both the Old and New Continents appear to have been encroached upon by the Ocean in the ſame latitudes: both are furniſhed with a great Mediterranean and a vaſt number of iſlands, which likewiſe lie nearly in the ſame latitudes. The only difference is, that the Old Continent, being much larger than the New, has a Mediterranean on its weſt coaſt, to which the New Continent has nothing analogous. But both ſeem to have undergone ſimilar revolutions. Theſe revolutions are greateſt near their middle parts, or between the tropics, where the motion of the ſea is moſt violent. For other particulars relating to theſe Continents, we refer to the deſcription of their reſpective countries.

It has been remarked, that a conſiderable portion of the elevated and ſolid matters or ſtrata which form our Continents, are oppoſite to a large or deep ocean at the anti-podes or oppoſite ſide of the earth: and this circumſtance affords matter for important reflections, when we take into our account that theſe parts, now ſo conſiderably elevated above the level of the Ocean, once formed part of its bottom, as appears from the nature and diſpoſition of the ſtrata themſelves, but more eſpecially from the ſhells and other aquatic remains found lodged in them, in a perfect and unbroken ſtate, lying in the ſame manner and poſitions, as the ſhells, &c. of living animals are found to be diſtributed, on the bottom of the ſea, in places where divers have had opportunities of examining them. The following queſtions here naturally preſent themſelves; has the quantity of water on the ſurface of the earth been ſo much diminiſhed, as to lay the continents thus bare; or, has the centre of gravity of the earth been ſo deranged, as to occaſion the waters to accumulate in particular places and leave others uncovered? For a long time there ſeemed little difficulty in ſolving the myſtery, by anſwering the firſt queſtion in the affirmative, on the principles of thoſe who maintained, that the earth was only a hollow cruſt or ſhell of matter, and that great part of the waters of the univerſal ocean had retreated into the internal cavities of the globe. But ſince the labours of Britiſh philoſophers have concurred in proving, that the ſpecific gravity of the entire or compound maſs of the terraqueous globe is 5 times that of water, while all the water exiſting in or upon the earth, (of ſp. grav. 1, or little more) and all the earths and ſtones (whoſe ſpecific gravities do not exceed 2$\frac{1}{2}$ or 2$\frac{3}{4}$ on the average) are included; we are forced to conclude, not only that the central parts of the globe are ſolid, but compoſed alſo of much heavier materials, than thoſe which conſtitute the ſuperficial ſtrata. Another circumſtance alſo concurs to ſhew the improbability, of any large caverns now exiſting, filled with water in the interior parts of the earth, *viz.* the fiſſures, which ſo univerſally are found, breaking and dividing even the hardeſt rocks and ſtrata, into comparatively ſmall and irregular fragments, ſo as to render them incapable of arching or ſupporting themſelves over water without an actual contact or bearing upon each other: and accordingly caverns or grottos of any conſiderable ſize are rarely met with in mining, and theſe principally, if not entirely, in very hard lime-ſtone ſtrata, near the ſurface, and carrying but a comparatively ſmall load of ſuperincumbent ſtrata.

This ruptured and broken ſtate of the ſolid matters of the globe, has probably fitted them for obeying the action of the centrifugal force generated by its diurnal revolution, and for aſſuming nearly the form of an *ellipſoid* (as the late meaſurements of degrees upon the earth's ſurface in various parts of the world have ſhewn;) otherwiſe, moſt probably, the equatorial parts of the earth muſt have been occupied by a zone of water inſtead of poſſeſſing Iſlands and parts of Continents in common with other parts of the world, as they now do. Let the reader but conſider the immenſe weight of ſolid matter which exiſts above the level of the ſea, or general ellipſoidal lines of equilibrium, in one of our Continents; and ſuppoſe a cylindrical perforation to be made under ſuch Continent, quite through the earth to the oppoſite ocean, ſo as to ſeparate, for the ſake of argument, this cylindrical column of the earth and water from the reſt of the earth, (as the broken ſtate of the ſtrata and the actual hardneſs of their fragments entitles us to ſuppoſe poſſible) and it will appear, as a neceſſary conſequence of equilibrium, that the continent and ſtrata under it to the centre of the earth muſt be equal in weight to the ſame ſpace of Ocean at the antipodes, and the ſtrata under its bottom extending to the ſame centre ; for if theſe were different, and we ſuppoſe the Continent to preponderate, it is plain from the waters of the Ocean covering the other end of the cylinder being at liberty to recede, that they would do ſo, and the Continent would ſink and the bottom of the oppoſite Ocean would riſe, until the equilibrium was reſtored : and in like manner if the ſtrata under the ocean be ſuppoſed the heavieſt, a further protruſion and conſequent elevation of the Continent, compared with its ſurrounding ſeas, would enſue. This view of the ſubject leads, in the opinion of the writer of this part of our article, to the concluſion, that a very large maſs, or perhaps ſeveral maſſes of matter of a high ſpecific gravity, now occupy the bottom of the Ocean oppoſite to the Continents and large iſlands, which were not there at the time that theſe Continents occupied a lower place in reſpect to the centre of the earth, and were covered by the univerſal Ocean : and he thinks, that he has diſcovered the ſource whence theſe very heavy and diſturbing maſſes of matter were derived, in the diſappearance of ſome immenſe ſatellitic body which apparently for a long period revolved round this earth, very near to its ſurface, and occaſioned tides ſo rapid and enormous, as to heave up the land and break the ſtrata into innumerable fragments, permanently denudating ſome parts, when elevated above the point of equilibrium between the earth and ſatellite's attraction, and pouring down upon other parts of the ſurface, ſuch torrents of the ruins of abraded ſtrata, as entirely to hide the ſtrata of theſe diſtricts under alluvial coverings ; forming, in numerous inſtances, hills of great height and extent, containing large and irregular fragments of rocks, and different known ſtrata, thrown together throughout their whole thickneſs and extent, in the greateſt apparent confuſion. For other obſervations and conjectures, relating to this ſubject ; ſee EARTH.

The diſcovery of a ſouthern Continent has been an object of curious and diligent inveſtigation ; but hitherto without ſucceſs. Captain Cook's ſecond voyage commenced in the year 1772, was undertaken with a particular view to the deciſion of the queſtion, concerning the exiſtence of a ſouthern Continent. In the proſecution of this voyage, and while he was proceeding ſouthward in queſt of a Continent, he fell in with ice iſlands, in S. lat. 50° 40′ and 2° of longitude from the Cape of Good Hope ; in his farther progreſs, he was ſtopped by other fields of ice, which led him to imagine, from a notion that theſe are formed in bays and rivers, that he could not be at a great diſtance from land. But having ſailed in S. lat. 55° 40′ for more than 30 leagues along the edge of the ice without finding any opening, he found that this ice did not join the land ; and therefore he thus diſcovered the fallacy of the general opinion, that ice is always formed in the vicinity of land. The obſervations of captain Cook confirmed thoſe of other navigators, that the cold of the ſouthern ſeas is much more intenſe than that of equal latitudes in the northern hemiſphere ; and he alſo aſcertained that this cold was not owing to the vicinity of a Continent, as had formerly been imagined. On the contrary, it was now determined beyond diſpute, that if any ſuch Continent exiſted in the eaſtern part of the ſouthern Ocean, it muſt be confined within the latitude of 60°. Having advanced as far as S. lat. 62° 10′ and W. long. 172°, he found the farther he proceeded that the number of ice iſlands very much increaſed ; and in lat. 67° 31′, and W. long. 142° 54′, he got into ſuch a cluſter of theſe iſlands, that it was both difficult and dangerous to eſcape them. Finding it impoſſible to get any farther to the ſouthward, he determined to explore a conſiderable tract of ſea to the north of his preſent ſituation, and then again to ſtand to the ſouth. But in this he was unſucceſsful ; no land being diſcovered either in ſailing northward, eaſtward, weſtward, or ſouthward ; though he proceeded in the laſt direction as far as 71° 10′ S. lat. and 106° 54′. W. long. It was now impoſſible to advance ; and it was the opinion of the captain himſelf, as well as of moſt of the gentlemen on board, that the ice by which they were now ſtopped extended as far as the pole. The moſt ſoutherly land diſcovered by this perſevering navigator was that on which he beſtowed the name of " Southern Thule," and which is ſituated in S. lat 59° 13′ 30″. W. long. 27° 45′. Here not a ſingle herb of any kind was ſeen, but very high and barren mountains, the tops of ſome of which reached above the clouds ; and we may obſerve, that this ſeems to be the only part of the world hitherto diſcovered, altogether unfit for the ſupport of animal life. This country was diſcovered on the 31ſt of January 1775. Upon the whole, it may be concluded, that the greateſt part of the ſouthern Continent, if it has any exiſtence, muſt be within the polar circle, where the ſea is ſo encumbered with ice, that the land muſt be inacceſſible. So great is the danger in navigating theſe ſouthern ſeas, that captain Cook aſſerts on the moſt probable grounds, that ſuch lands as lie to the ſouthward of his diſcoveries could not be explored ; and that even no man could venture farther than he had done. Thick fogs, ſnow-ſtorms, intenſe cold, and every attendant circumſtance that can render navigation difficult and dangerous, muſt be encountered ; and all theſe difficulties and dangers are heightened to a very great degree by the inexpreſſibly horrid aſpect of the country itſelf. It is a part of the world deemed by nature never to feel the warmth of the ſun's rays, but to be buried in everlaſting ſnow and ice. Whatever ports there may be in the coaſt, they are almoſt entirely covered with frozen ſnow of a vaſt thickneſs. If however any of them ſhould be ſo far open as to invite a ſhip into it, ſhe would run the riſk of being fixed there for ever, or of coming out on an ice iſland. Beſides, the iſlands and floats on the coaſt, the great falls from the ice-cliffs in the port, or a ſudden ſnow-ſtorm, might be attended with equally fatal effects. For theſe reaſons captain Cook determined to abandon the purſuit of a land, whoſe exiſtence was ſo equivocal, but whoſe inutility, if it could be diſcovered, was certain.

After captain Cook's perſevering and fruitleſs traverſes through every corner of the ſouthern hemiſphere, who, for the future, ſays the editor of Cook's third voyage (vol. i. Int. p. 56.), will pay any attention to the ingenious reveries of Campbell, de Broſſes, and de Buffon ? or hope to eſtabliſh an intercourſe with ſuch a continent as Maupertuis's fruitful imagination had pictured ? A Continent equal, at leaſt, in extent, to all the civilized countries in the known northern hemiſphere, where new men, new animals, new productions of every kind, might be brought forward to our view, and diſcoveries be made, which would open inexhauſtible treaſures of commerce. (See Maupertuis's Letter to the King of Pruſſia.) The author of the Preliminary Diſcourſe to Bougainville's " Voyage aux Iſles Malvaines" computes, that the ſouthern Continent (for the exiſtence of which, he owns, we muſt depend more on the conjectures of philoſophers, than on the teſtimony of voyagers) contains

8 or 10 millions of ſquare leagues! We can now boldly take it upon us to diſcourage all expeditions formed on ſuch reaſonings of ſpeculative philoſophers, into a quarter of the globe, where our perſevering Engliſh navigator, inſtead of this promiſed fairy land, found nothing but barren rocks, hardly affording ſhelter to penguins and ſeals; and dreary ſeas and mountains of ice, occupying the immenſe ſpace allotted to imaginary paradiſes, and the only treaſures there to be diſcovered, to reward the toil, and to compenſate the dangers of the unavailing ſearch.

CONTINGENCY, in *Metaphyſics*, denotes the mere poſſible exiſtence or non-exiſtence of an object in any future time; and is oppoſed to *neceſſity*; which ſee. See alſo CHANCE and PROBABILITY.

CONTINGENCY *of blood*, in the writers of the laws of Scotland, is uſed for proximity of blood. Bayne, Crim. Law. p. 48.

CONTINGENT, literally ſignifies what may or may not happen, what is caſual or uncertain, and depending upon chance. See CHANCE. But in military acceptation, it denotes the quota or proportion of troops, money, and ammunition, which each of a body of leagued or confederated ſovereigns, or princes, furniſhes on emergencies, when required or called on, in virtue of and in ſupport of the confederation. In the wars of the German empire, each prince and ſtate, and all the members of the Germanic body, were obliged to furniſh their contingent. In like manner the princes forming the *confederation of the Rhine*, are, at preſent, obliged to furniſh their reſpective contingents.

CONTINGENT *bill*, of a regiment, is an account of the extra charges, which a regiment, in the due courſe of ſervice, is from circumſtances unavoidably and accidentally under the neceſſity of incurring.

CONTINGENT *line*, or tangent-line, in *Dialling*, denotes the interſection of the planes of the dial and equinoctial, and it interſects the ſubſtile or ſubſtilar line at right angles.

CONTINGENT *legacy*, is a legacy depending on the life of the legatee; if it be left to any perſon, *when* or *if* he attains the age of twenty-one, and if he dies before that time, it is a lapſed legacy; but if it is left *to be paid* when he attains that age, it is a veſted legacy; and if the legatee dies, his repreſentatives ſhall receive it out of the teſtator's eſtate at the time, when it would have become payable, if the legatee had lived.

CONTINGENT, or *Executory remainder*, in *Law*, is where an eſtate is limited to take effect, either to a dubious and uncertain *perſon*, or upon a dubious and uncertain *event*; ſo that a particular eſtate, which doth ſupport a remainder, may or may not determine before the remainder may commence. This kind of remainder is oppoſed to *veſted* or *executed* remainders. 3 Rep. 20. See REMAINDER.

CONTINGENT *uſe*, in *Law*, is an uſe limited in a conveyance of land, which may, or may not, happen, to veſt, according to the *contingency* expreſſed in the limitation of ſuch uſe. An uſe in contingency is ſuch which by poſſibility may happen in poſſeſſion, reverſion, or remainder. 1 Rep. 121. See USE.

CONTINGENTS are ſometimes alſo uſed by mathematicians in the ſame ſenſe as tangents.

CONTINI, GIAMBATISTA, in *Biography*, an architect who enjoyed conſiderable reputation at Rome in the latter part of the 17th and the beginning of the 18th century. He was born in the year 1641, and after having acquired at the ſchools a competent knowledge of languages, the Belles Lettres, and geometry, was placed by his father, who was likewiſe an architect, under the tuition of the celebrated Bernini. The inſtructions of his maſter were not thrown away, and Giambatiſta became employed by ſeveral of the firſt families of Rome. He conſtructed many of thoſe magnificent altars and chapels with which the churches of Rome abound, and built the duomo of Vetralla as well as that of Vignarello. His works are enumerated by his biographer Lione Paſcoli, who informs us that he lived highly reſpected, and died in 1723. Paſcoli.

CONTINUAL CLAIM. See CLAIM *continual*.

CONTINUAL *proportionals*. When in a ſeries of quantities the firſt is to the ſecond as the ſecond to the third, and the third to the fourth, and the fourth to the fifth, &c. they are called *continual proportionals*: ſuch are 1, 2, 4, 8, 16, &c. where the terms increaſe in a two-fold ratio; and 36, 12, 4, $\frac{4}{3}$, &c. where they decreaſe in a triple ratio. Such a ſeries is otherwiſe called a *progreſſion*.

CONTINUANCE, in *Law*, is much the ſame as *prorogation* among the civilians. It denotes the continuing of a cauſe in court, by an entry upon the records there for that purpoſe. After iſſue or demurrer joined, as well as in ſome of the previous ſtages of proceeding, a day is continually given and entered upon the record, on which the parties are to appear, from time to time, as the exigency of the caſe may require. The giving of this day is called the "continuance," becauſe thereby the proceedings are continued without interruption from one adjournment to another. If theſe continuances are omitted, the cauſe is thereby diſcontinued, and the defendant is diſcharged *ſine die*, without a day, for this term: for by his appearance in court, he has obeyed the command of the king's writ; and, unleſs he be adjourned over to a day certain, he is no longer bound to attend upon that ſummons; but he muſt be warned afreſh; and the whole muſt begin *de novo*. It may ſometimes happen, that after the defendant has pleaded, nay, even after iſſue or demurrer joined, there may have ariſen ſome new matter, which it is proper for the defendant to plead; as, that the plaintiff, being a feme-ſole, is ſince married, or that ſhe has given the defendant a releaſe, and the like: here, if the defendant takes advantage of this new matter, as early as he poſſibly can, *viz.* at the day for his next appearance, he is permitted to plead it in what is called a plea *puis darrein-continuance*, or ſince the laſt adjournment. For it would be unjuſt to exclude him from the benefit of this new defence, which it was not in his power to make when he pleaded the former. But it is dangerous to rely on ſuch a plea, without due conſideration; for it confeſſes the matter which was before in diſpute between the parties (Cro. Eliz. 49.) And it is not allowed to be put in, if any continuance has intervened between the ariſing of this freſh matter and the pleading of it; for then the defendant is guilty of neglect, or *laches*, and is ſuppoſed to rely on the merits of his former plea. Alſo it is not allowed after a demurrer is determined, or verdict given; becauſe then relief may be had in another way, namely, by writ of *audita querela*. And theſe pleas *puis darrein continuance*, when brought to a demurrer in law or iſſue of fact, ſhall be determined in the ſame manner with other pleas. Blackſt. Comm. vol. iii.

Continuances and eſſoins are amendable upon the roll, at any time before judgment:—they are the acts of the court, and at common law they may amend their own acts before judgment, though in another term; but their judgments are only amendable in the ſame term in which they are given. (3 Lev. 431.) Upon an Original, one term, or two, or three terms may be meſne between the teſte and the return; and this ſhall be a good continuance; for the defendant is not prejudiced by it, and the plaintiff may give a day to the defendant beyond the common day, if he will. But a continuance by *capias* ought to be made from term to term, and there cannot be any meſne term, becauſe the defendant ought not to ſtay ſo long in priſon. (2 Danv. Abr. 150.) If a man recover upon demurrer, or by default, &c. and a writ of inquiry of damages is awarded, there ought to be continuance between the firſt and ſecond judgment, otherwiſe it will be a diſcontinuance; for the firſt is but an award, and not compleat, till the ſecond judgment, upon the return of the writ of inquiry of damages. (Ibid. 153). If the plaintiff be non-ſuited, by which the defendant is to recover coſts; if the plaintiff will not enter his continuances, on purpoſe to ſave the coſts, the defendant ſhall be ſuffered to enter them. (Cro. Jac. 316, 317.) The courſe of the court of King's Bench is to enter no continuance upon the roll, till after iſſue or demurrer, and then to enter the continuance of all upon the back, before judgment; and if it is not entered, it is error. (Trin. 16 Jac. B. R.) See Discontinuance.

Continuance *of a writ*, or *action*, is its holding in force from one term to another, in a caſe where the ſheriff has not returned, or executed, a former writ iſſued out in the ſame action.

Continuance *of aſſiſe*. If a record in the treaſury be alleged by one party, and denied by the other, certiorari ſhall be ſued to the treaſury and chamberlain of the exchequer; who, if they certify not that the ſaid record is there, or likely to be in the Tower; the king ſhall then ſend to the juſtices, repeating the certificate, and will them to *continue the aſſiſe*.

CONTINUANDA *aſſiſa*. See Assisa.

CONTINUANDO, in *Law*, a term uſed in a declaration of treſpaſs, where a plaintiff would recover damages for ſeveral treſpaſſes in the ſame action. To avoid multiplicity of ſuits, a man may in one action of treſpaſs recover damages for many treſpaſſes; laying the firſt to be done with a *continuance* to the whole time in which the reſt of the treſpaſſes were done; which is done in this form: *continuando tranſgreſſionem prædictam, &c. à prædicto die, &c. uſque, &c.* Terms de Ley. 2 Roll. Abr. 545. Lord Raym. 240. 7 Mod. 152.) This declaration of treſpaſs may be alleged, where the inquiry is continually renewed, as by ſpoiling or conſuming the herbage with the defendant's cattle; in which caſe the *continuando* is good. (1 Lill. Abr. 307.) Thus alſo treſpaſs for breaking a houſe with *continuando* is good; and until a re-entry is made, the continuation of the poſſeſſion is a continuing of the treſpaſs (Lutw. 1312.) But where the treſpaſs is by one or ſeveral acts, each of which terminates in itſelf, and being once done cannot be done again, it cannot be laid with a *continuando*; yet if there be repeated acts of treſpaſs committed, (as cutting down a certain number of trees,) they may be laid to be done, not continually, but at divers times and days within a given period. Salk. 638, 639. Lord Raym. 823.

Continuando *Proceſſum*. See Processum and Continuance.

CONTINUANS Punctum. See Punctum.

CONTINUATION *of* Motion. See Motion and Projectile.

CONTINUATIVE Conjunctives, in *Grammar*, are thoſe conjunctions, uniting both ſentences and their meaning, which join thoſe ſentences only, which have a natural connection; in contradiſtinction to copulative, which join all ſentences, however incongruous in ſignification. The latter merely couple ſentences, and are applicable to all ſubjects, whoſe natures are not incongruous. The former, on the contrary, by more intimate connection, conſolidate ſentences into one continuous whole, and are therefore applicable only to ſubjects which have no eſſential coincidence. The principal copulative in Engliſh, is, *and*; the continuatives are, *if*, *becauſe*, *therefore*, *that*, &c. *E. G.* "Lyſippus was a ſtatuary, *and* Priſcian was a grammarian."—"The ſun ſhineth, *becauſe* the ſky is clear." Continuatives, according to the diſtribution of Mr. Harris (Hermes, p. 244.) are either ſuppoſitive, as, *if*; or poſitive, as, *becauſe*, *therefore*, &c. *E. G.* "You will live happily, *if* you live honeſtly."—"You will live happily, *becauſe* you live honeſtly." The difference between theſe continuatives is this; the ſuppoſitives denote connection, without aſſerting actual exiſtence; and the poſitives imply both the one and the other. Moreover, poſitives are either caſual, as, *becauſe*, *ſince*, *as*, &c.; or collective, as *therefore*, *then*, &c.; and they differ in this reſpect, that the cauſals ſubjoin cauſes to effects, thus; "the ſun is eclipſed, *becauſe* the moon intervenes;" but the collectives ſubjoin effects to cauſes, thus; "the moon intervenes, *therefore* the ſun is eclipſed." All theſe continuatives may be reſolved into copulatives. Inſtead of "*becauſe* it is day, it is light," we may ſay, "it is day, *and* it is light."

CONTINUATO, in the *Italian Muſic*, is uſed to direct a ſinger, or player, to continue or hold on a ſound, in equal ſtrength or manner; or to continue a movement in an equal degree of time all the way.

CONTINUED Fever. A fever without remiſſions or intermiſſions. See Fever.

Continued *Quantity*. } See Continuum, Continuity,
Continued *Body*, &c. } and Quantity.

Continued, or *thorough baſs*, in *Muſic*, is that which continues to play conſtantly, both during the recitatives, and to ſuſtain the choir, or chorus.

Continued *proportion*, in *Arithmetic*, is that in which the conſequent of the firſt ratio is the ſame with the antecedent of the ſecond: as, 3 : 6 :: 6 : 12. See Proportion.

On the contrary, if the conſequent of the firſt ratio be different from the antecedent of the ſecond, the proportion is ſaid to be *diſcrete*: as, 3 : 6 :: 4 : 8. See Discrete.

Continued *zocle*, or *ſocle*, in *Architecture*. See Socle.

Continued *Attic*, *Community*, *Pedeſtal*. See the ſubſtantives.

CONTINUI Solutio. See Solutio.

CONTINUITY is uſually defined among *Schoolmen*, the immediate coheſion of parts in the ſame *quantum*. Others define it, a mode of body, whereby its extremes become one: and others, a ſtate of body reſulting from the mutual implication of its parts.

Continuation relates to *duration*, and continuity to *extenſion*. We ſay, the *continuation* of a work, or an action; and the *continuity* of ſpace or ſize; *continuation* of the ſame conduct; and *continuity* of the ſame building.

There are two kinds of continuity, *mathematical* and *phyſical*. The firſt is merely imaginary and fictitious; ſince it ſuppoſes real or phyſical parts where there are none. *Phyſical* continuity is, ſtrictly, that ſtate of two or more parts, or particles, wherein they appear to adhere, or conſtitute one uninterrupted quantity, or *continuum*; or between which we perceive no intermediate ſpace.

The ſchoolmen diſtinguiſh two other ſorts of continuity; viz. *homogeneous*, and *heterogeneous*. The firſt, where our ſenſes do not perceive the bounds, or extremes, of the parts; and this agrees even to air, water, &c. The ſecond, where our ſenſes indeed perceive the extremes of certain parts, yet at the ſame time obſerve the ſame parts cloſely linked to each other; either in virtue of their ſituation or figure, &c.

and this is chiefly attributed to the bodies of animals and plants.

The continuity of bodies is a ſtate merely relative to our ſight and touch: *e. gr.* if the diſtance of two ſeparate objects be ſuch, as that the viſual angle they ſubtend is inſenſible to the eye, which it will be if leſs than ſixteen ſeconds, the two ſeparate bodies will then appear *contiguous.* Now, the reſult of ſeveral *contiguous* objects, is a *continuity:* ſo that any number of viſible objects, being placed ſo as that the diſtances ſubtend angles of leſs than ſixteen ſeconds, they will appear to form one *continuum.*

And hence, as we can determine the diſtance at which any given magnitude becomes inviſible; it is eaſy to find at what diſtance any two bodies, however remote from each other, will appear as contiguous; and ſeveral, as forming one *continuum.* For the phyſical cauſe of continuity, ſee Coheſion.

Leibnitz, an eminent mathematician, has ſuppoſed what he calls a law of continuity to obtain in the univerſe, by which law every thing that is executed or done in nature, is done by infinitely ſmall degrees. He urges, that good ſenſe dictates this truth, *natura non operatur per ſaltum,* or that nothing can paſs from one extreme to another, without paſſing through all the intermediate degrees. Bernouilli Opera, tom. iii. p. 9. *ſeq.*

This law ſeems ſubject to difficulties: rigorouſly taken, it ſuppoſes actual, and yet infinitely ſmall changes, which ſome philoſophers cannot reliſh; and if we ſuppoſe changes only imperceptible to our ſenſes, but finite, the law of continuity is no leſs violated, than if the univerſe were to be ſuddenly deſtroyed, as M. Maupertuis juſtly obſerves. Mem. de l'Acad. de Berlin. tom. ii. p. 284.

This law of continuity led Mr. Bernouilli to reject all hard bodies as chimeras, and naturally impoſſible.

CONTINUO, in the *Italian Muſic,* is ſometimes applied to *baſſo,* to ſignify the thorough-baſs. That *baſſo continuo,* is the continual, or thorough-baſs. It is ſometimes marked in muſic books by the letters B, C.

Continuo is alſo uſed for a ſpecies of harmony mentioned by Julius Pollux, and which, ſays Zarlino, anſwers to the perpetual burden of our bag-pipes, which now and then muſt be harmonious.

CONTINUOUS Fevers. See Continued *fever.*

CONTINUUM, or Continued *quantity,* in *Phyſics,* denotes a quantity, or co-extenſion, whoſe parts are not divided, but joined and connected together, ſo as to leave no room to determine where one begins, and another ends.

It is controverted, among philoſophers, whether a *continuum* be infinitely diviſible, *i. e.* diviſible into infinite proportionable parts?

The ancients attributed the riſe of water, in pumps, to the love of continuity, and the abhorrence of a vacuum; becauſe the weight and preſſure of the air were not then known.

Mathematicians divide quantity into *continued* and *diſcrete.* The former being that which is expreſſed by lines, and makes the ſubject of geometry; and the latter comprehending thoſe that are expreſſed by numbers, which make the ſubject of arithmetic.

In medicine and chirurgery, wounds, ulcers, fractures, &c. are expreſſed by the phraſe *ſolutio continui,* or *ſolution of continuity.*

In a critical ſenſe, we ſay, there ought to be a continuity, *i. e.* a connexion between the parts of a diſcourſe.

In the epic poem, particularly, the action ſhould have a continuity in the narration, though the events, or incidents, be not continued. As ſoon as ever the poet has opened his ſubject, and brought his perſons on the ſtage, the action is to be continued to the end; every character muſt be at work, and no ſuch thing as an idle perſon to be ſeen.

F. Boſſu obſerves, that, by retrenching dull languiſhing incidents, and intervals void of action, which break the continuity, the poem acquires a continued force, which makes it run equally throughout.

CONTOBABDITES, a ſect in the ſixth century. Their firſt leader was Severus of Antioch, who was ſucceeded by John the grammarian, ſurnamed Philoponus, and one Theodoſius; whoſe followers were alſo called Theodoſians.

Some of them who were willing to receive a book compoſed by Theodoſius on the Trinity, made a ſeparate body, and were called *Contobabdites,* from a place not known, which Nicephorus does not mention, but which muſt apparently have been the place where they held their aſſemblies.

The Contobabdites allowed of no biſhops; which is the only circumſtance tranſmitted to us concerning them.

CONTOOCOOK, in *Geography,* a river of the United States of America, in New Hampſhire, which runs into the Merrimack, four miles N. of Concord.

CONTOPÆCTÆ, of κοντος, *pole,* and πηκτος, *compaſt,* in *Antiquity,* a ſort of artiſts who ſupported a pole on their foreheads ſo firmly, that boys could play, dance, and wreſtle together on it.

CONTOR, or Cuntore, in *Ornithology.* See Condore.

CONTORSION, in *Surgery,* a twiſting or deformity of ſome part of the body; ariſing generally from a diſeaſed ſtructure of the bones, or an irregular action of the muſcles. Thus a contorſion of the back may be occaſioned by a caries, or a rickety diſpoſition in the vertebræ; and a contorſion, or twiſting of the head, ſo that the chin ſhall be turned towards one ſhoulder, may ariſe from a paralyſis, or a ſpaſmodic ſtate of the ſterno-maſtoid muſcle. But the nature of this diſeaſe is more particularly deſcribed under the article Distortion, to which the reader is referred.

CONTORTÆ, or Contorti, in *Botany,* the twenty-ninth natural order in the Philoſophia Botanica of Linnæus, and the thirtieth of the Prelections. In the Philoſophia Botanica, it conſiſts of the following genera: rauwolfia, tevetia, cerbera, plumiera, tabernæmontana, cameraria, periploca, nerium, vinca, apocynum, cynanchum, ceropegia, aſclepias, ſtapelia. In the ſynoptic table, annexed to the Prelections, they ſtand thus: I. Pericarp a follicle; tabernæmontana; cameraria; plumeria; echites; nerium; ceropegia; vinca; apocynum; aſclepias; cynanchum; periploca; *pergularia;* ſtapelia; *embothrium, *Forſt.* *rhopala, *Aubl.*; *plectronia? allamanda.* II. Pericarp a capſule; macrocnemum; *manettia;* cinchona, removed from cymoſæ; *portlandia; rondeletia; hilliæ; genipa.* III. Pericarp a berry; *gardenia; muſſænda; randia;* * fagræa, *Thunb.; cariſſa; pæderia; arduina;* lycium and ceſtrum, both removed from vepoeculæ; *gynopogon, *Forſt.*: *willughbeja. *Schreb.;* melodinus, *Linn. jun.* IV. Pericarp a drupe; rauwolfia; cerbera. Thoſe printed in italics were added by Linnæus himſelf; thoſe marked with an aſteriſk, by Giſeke from other authors. The order was named by Linnæus, from the form of the corolla, which is twiſted in a direction contrary to the ſun: its border, when open, reſembles a wheel, each ſegment having generally unequal ſides, with the ſhorter ſide placed under the longer ſide of the preceding one. Only three of the genera are natives of Europe, aſclepias, vinca, and cynanchum: moſt of them are lacteſcent and poiſonous;

ſome highly deleterious. *Root* perennial. *Leaves* undivided, generally oppoſite, ſometimes three or four together, rarely alternate. *Inflorescence* often ſingular, the peduncle ariſing from the ſide of the ſtem betwixt the pairs of leaves, not from their axils. *Calyx* one-leafed, five-cleft. *Corolla* regular, monopetalous, five-cleft: ſtructure of the nectaries in moſt genera very ſingular. *Stamens* five. *Piſtils* two, or one with a double ſtigma. Germ generally ſuperior.

CONTOUR, in *Painting* or *Drawing*, a French word, ſynonymous with contorno in the Italian, and outline in the Engliſh language. Perfection of outline conſtitutes, perhaps, the greateſt difficulty in painting; although it is, properly ſpeaking, only *one* of the requiſites of deſign; yet the knowledge of it ſeems neceſſarily to pre-ſuppoſe a thorough acquaintance with all the remainder; and hence the adage of Annibale Caracci, not very delicately expreſſed in the Italian, "Give me but a correct outline, and fill it up as you pleaſe!" See DESIGN.

CONTOUR, alſo denotes the compaſs, limits, or enceinte of a country, place, camp, plan, deſign, &c. It is the ground work of each of theſe things.

CONTOURNE', a French term applied to any animal that is ſtanding or paſſing with its face towards the ſiniſter ſide of the eſcutcheon. In Engliſh heraldry it is termed *counter paſſant*,

CONTOURNIATED, or CONTORNIATED, a term applied among *Antiquaries* to a ſpecies of medals, ſo called from the Italian *contorniato*, encircled, on account of the hollow circle which commonly runs round them. They are diſtinguiſhed from medallions, as they are ſometimes denominated, not by their ſize, but by their thinneſs; faint relief; reverſes ſometimes in *intaglio*, hollowed, not raiſed; and, in general, by their peculiar and inferior workmanſhip. Medallic writers have formed various opinions concerning theſe ſingular pieces of coinage. Some ſuppoſe that they were ſtruck by Gallienus, to the memory of illuſtrious men, and celebrated athletæ, at the time when he cauſed all the conſecration-coins of his predeceſſors to be reſtored. This ſentiment ſeems nearly to have been adopted by M. Mahudel, who ſays, (Hiſt. de l'Acad. des Belles Lettres, tom. v. p. 284.) that the contorniati were ſtruck originally at Rome, about the cloſe of the third century. F. Hardouin conjectures, that they were not earlier than the 13th century; other antiquaries refer them to the fifth century; and others find inſtances of them as ancient as the time of Nero; others again aſcribe the invention of them to Greece, in her days of glory, and they ſuppoſe that they were appropriated to the purpoſe of honouring the memories of great men, and principally of thoſe who had borne away the prize at the ſolemn games; ſuch are thoſe which bear the names or images of Homer, Solon, Euclid, Pythagoras, Socrates, Apollonius Tyanæus, and ſeveral Athletæ, whoſe victories are expreſſed upon them by palms, and chariots, either bigæ or quadrigæ. Havercamp, in an expreſs work on theſe pieces, thinks they were ſtruck from the times of Conſtantine I. to thoſe of Valentinian III. on account of the public games. Mr. Pinkerton (Eſſ. on Medals, vol. i. p. 232.) ſuggeſts, that they were tickets for different places in the public games. The dye, appearance, device, inſcription of the reverſe—every thing—confirmed this opinion; which he has found perfectly conſonant to that of two or three of the firſt medalliſts in this country. This opinion is ſo far conformable to that of Havercamp, and others, as it ſuppoſes that theſe pieces were ſtruck upon occaſion of the games. But it differs in repreſenting theſe medals, as mere tickets for places at the games; and ſtill more in ſuppoſing them ſtruck in all ages of the empire, from Auguſtus, downwards. Thoſe who ſuppoſe them ſtruck in the lower empire, are reduced to the deplorable dilemma of imagining, that Chriſtian princes thought Nero's head an honour to their games; and that they preſerved the portrait of Apollonius Tyanæus, the enemy of their faith, and thoſe of other Pagan philoſophers. Joubert indeed aſcribes them to the upper empire, without determining whether they were ſtruck under one prince, or all who gave games. Mr. Pinkerton is convinced, that they were ſtruck under the various emperors whoſe names they bear; and that when Conſtantine I. introduced Chriſtianity, they would almoſt vaniſh, inſtead of beginning, according to the opinion of Havercamp. The difference of workmanſhip, in theſe pieces, if accurately inſpected, may ſhew this of itſelf, independently of other reaſons. Although theſe pieces are of different kinds, they are moſtly of a ſize between two and three inches in diameter. Some have, upon the obverſe part, the head of the emperor or empreſs, who gave the games; and almoſt a ſeries of them might be formed from Auguſtus down to Gallienus. In confirmation of this opinion, it is further alleged, that thoſe emperors, who were remarkably diſtinguiſhed by their attachment to public diverſions, occur very frequently on theſe pieces, which Mr. Pinkerton calls "ticket-medals," whereas others appear more ſeldom, and thoſe who never preſented any games, not at all. Thoſe with Nero on their obverſes are ſo common as to be of very little value. Other obverſes preſerve the portraits of illuſtrious authors of antiquity, that are no where elſe to be found. Salluſt, Horace, and other Roman writers, were delineated on theſe tickets, when the memory of their perſons was yet freſh to the inhabitants of Rome, and we may therefore depend upon their portraits. This cannot be ſaid of the Greek portraits of Homer, Solon, Pythagoras, Socrates, and others, all which our author ſuppoſes to have been ſtruck at Rome, when Grecian actors were to perform, or in the Grecian cities, during the Roman empire. A few obverſes preſent athletæ, or actors in the games, and ſuch are commonly repreſented holding a horſe by the rein, or in ſome other attitude peculiar to their profeſſion. On the reverſes there is almoſt always a charioteer driving a chariot, or ſome ſimilar device, peculiar to public games. Thoſe ſtruck for the theatre are the moſt ſcarce, and have ſometimes on the reverſe an actor at full length, with "PLACEAS," *mayeſt thou pleaſe*, or ſome ſuch legend. One, in particular, has a buſt of Salluſt on the obverſe; and on the other ſide three perſons, one of whom bears an inſtrument, reſembling the common flute; another an inſtrument like the ſcenic flute ſeen in the hands of Pan; while the third is declaiming. The legend is "PETRONI PLACEAS," *mayeſt thou pleaſe, Petronius*. The perſon declaiming is Petronius, who was, perhaps, that day, to make his firſt appearance upon the Roman ſtage; and the whole deſign, in this laſt inſtance, is ſo clear, that Mr. Pinkerton cannot forbear being ſurpriſed, that the intention of theſe tickets ſhould ſo long have eſcaped the medallic authors. The ſuppoſition that they were tickets for different ſeats, or places, at the games, is further confirmed by the variety of marks to be found on the obverſes of them. Some have a ſprig of laurel; others a P, with an E below it, implying, perhaps, "podium equeſtre," or the box of the equeſtrian order, which laſt is very common; others bear a particular animal, or ſome ſuch badge. All theſe marks, in tickets perfectly preſerved, are cut in the braſs, and then filled up with ſilver. The pieces of this claſs, with imperial portraits, are of little value; thoſe bearing the images of illuſtrious men, are eſtimable, though not of great price. Apollonius Tyanæus, who flouriſhed in the reign of Domitian, and Apuleius, who lived in that of Antoninus the philoſopher, are, it is believed, the lateſt of that deſcription who appear upon theſe ticket-medals.

CONTRA, or COUNTER, in *Compoſition.* See COUNTER.

CONTRA, *Lat.* a prepoſition frequently uſed by the Italians in their *Muſic*: *contrappunto*, counterpoint; *contra baſſo*, double baſe; *contralto*, counter tenor; *contrappunto doppia*, double counterpoint; *contrappunto ſemplia*, ſimple counterpoint; *contrappunto fiorito*, florid counterpoint, &c. This Latin word, which the Italians have adopted, was originally applied to all the ſeveral parts deſtined to make harmony to a plain ſong or melody, as counterpoints or counterparts to the canto fermo. Thus, harmony in four and more parts was formed: as *baſſo*, baſe; *medius*, mean or middle part; *alto tenore*, high tenor, from the ſituation of the clef on the ſtaff; the *diſcantus*, *ſoprano*, *triplum*, or treble. When the alto tenore ſung the part oppoſite or *againſt* the treble, it was called *contralto* or *counter tenor*; and when a lower part was employed than the baſe, it was called *contra baſſo*: the title now given to a double baſe.

CONTRA, in *Surgery*. See COUNTER-*fiſſure*, COUNTER-*extenſion*, COUNTER-*opening*, COUNTER-*ſtroke*, &c.

CONTRA *battuta*, in *Muſic*, againſt, or out of time.

CONTRA *formam collationis*, in *Law*, a writ that lay where a man had given lands, in perpetual alms, to a religious houſe, hoſpital, ſchool, or the like, and the governor, or managers, had alienated the lands, contrary to the intention of the donor, for the recovery of them. Reg. Orig. 258.

This was founded on the ſtatute of Weſtm. 2. cap. 1.

CONTRA *formam feoffamenti*, a writ that lay for the heir of a tenant, infeoffed of lands or tenements by the lord's charter, to make certain ſuit and ſervice to his court; who was afterwards diſtrained for more ſervices than were contained in the charter. Reg. Orig. 176. Old Nat. B. ii. 162.

CONTRA *formam ſtatuti*, is the uſual concluſion of every indictment, &c. laid on an offence created by ſtatute.

If one ſtatute be relative to another, as where the former makes the offence, and the latter adds a penalty, the indictment ought to conclude *contra formam ſtatutorum.* 2 Hale's Pl. C. 173. c. 24. Where there are ſeveral ſtatutes, and it does not appear on which the information is founded, the concluſion, "contra formam ſtatuti" is ill. Cro. Jac. 142. Pl. 19. Broughton *v.* Moor, &c.

CONTRABAND, in *Commerce*, a prohibited commodity; or a merchandize bought or ſold, imported or exported, in prejudice, and contrary to the laws and ordinances of a ſtate, or the public prohibitions of the ſovereign.

The word comes from the Italian *contrabando*, of *contra* and *bando*, q. d. contrary to edict, or publication of prohibition.

Contraband goods are not only liable to confiſcation themſelves, but do alſo ſubject all other allowed merchandizes found with them in the ſame box, parcel, or bale, together with the horſes, waggons, &c. which conduct them to the ſame.

In England there are two principal contrabands for exportation, wools and live ſheep, which all ſtrangers are prohibited from carrying out, on pain of having the right hand cut off; the other, that of ſheep-ſkins and calf-ſkins, which all foreigners are in like manner prohibited from exporting, on pain alſo of having the right hand cut off; yet the ſubjects of England are allowed to tranſport the ſame from France to England. See WOOL and SHEEP.

Since the year 1662, when liſts were formed of contraband goods, as to the import, and which included more than fifty different ſorts, many regulations and ſtatutes have been enacted; and theſe are ſo numerous and various, and ſo liable to change in the fluctuating ſtate of commerce, that in a work of this kind it would be of little permanent utility to recite them.

In 1719 and 1720, an attempt was made in parliament to paſs a bill for putting gold and ſilver, whether in coined ſpecies, or otherwiſe, among the number of contraband goods for exportation; but in vain, by reaſon of the ſtrong oppoſition made by thoſe who enrich themſelves by the export of theſe metals; which, by the laws of the kingdom, are allowed to be ſent away, upon entering them, paying the duty of the export, and making oath of their being foreign, *i. e.* of their not being the coin or plate of the kingdom, melted down. See CUSTOMS.

CONTRACT, a mutual conſent of two or more parties, who promiſe and oblige themſelves voluntarily, to do ſomething, pay a certain ſum, or the like.

As a contract is a mutual promiſe, the obligation of contracts, the ſenſe in which they are to be interpreted, and the caſes where they are not binding, will be the ſame as of promiſes. See PROMISE. From the principle on which the obligation of promiſes is founded, *viz* "that this obligation is to be meaſured by the expectation which the promiſer any how voluntarily and knowingly excites," reſults a rule, which governs the conſtruction of all contracts, and is capable, from its ſimplicity, of being applied with great eaſe and certainty: the rule is, that "whatever is expected by one ſide, and known to be ſo expected by the other, is to be deemed a part or condition of the contract." The ſeveral kinds of contracts may be comprehended under thoſe of ſale, hazard, loan of inconſumable property and of money, and labour, including ſervice, commiſſions, partnerſhip, and offices. With regard to contracts of ſale, the rule of juſtice, which ought principally to be inculcated in the making of bargains, is, that the ſeller is bound in conſcience to diſcloſe the faults of what he offers to ſale. If it be deemed diſhoneſt to magnify beyond the truth the good qualities of the commodity which we have to ſell, is it leſs unjuſt to conceal its faults? The buyer in many caſes has no ſecurity from impoſition, but in the ingenuouſneſs and integrity of the ſeller. This rule, however, admits of one exception, namely, where the ſilence of the ſeller implies ſome fault in the thing to be ſold, and where the buyer has a compenſation in the price for the riſk which he runs: as where a horſe, in a London repoſitory, is ſold by public auction, without warranty; the want of warranty is notice of ſome unſoundneſs, and produces a proportionable abatement in the price. (See WARRANTY.) To this head of concealing the faults of the article which we want to diſpoſe of may be referred the practice of paſſing bad money. This practice has been ſometimes defended by a vulgar excuſe, that we have taken the money for good, and muſt therefore get rid of it: that is, in other words, we have been deceived or impoſed upon, and therefore we may deceive or impoſe upon others. This excuſe is much the ſame, as if one, who had been robbed upon the highway, ſhould allege that he had a right to re-imburſe himſelf out of the pocket of the firſt traveller he met: the juſtice of which reaſoning the traveller poſſibly may not comprehend. (See UTTERING *of falſe money*.) Where no monopoly or combination exiſts, the market price is always a fair price; becauſe it will always be proportionable to the uſe and ſcarcity of the article. Innumerable queſtions relating to this kind of contract are determined ſolely by *cuſtom*; not, indeed, that cuſtom poſſeſſes any proper authority to alter or aſcertain the nature of right and wrong; but becauſe the contracting parties are preſumed to include, in their ſtipulation, all the conditions which cuſtom has annexed to contracts of the ſame ſort: and when the uſage is notorious, and no exception made to it, this preſumption is generally agreeable to the fact. Thus, in juſtice as well as in law, what is called "the cuſtom of merchants" regulates the conſtruction of mercantile concerns.

By contracts of hazard are meant *gaming* and *inſurance.* See theſe articles.

Contracts of loan comprehend thoſe pertaining to inconſumable property, and to money. When the identical loan is to be returned, as a book, a horſe, &c. it is called "inconſumable," in oppoſition to corn, wine, money, and thoſe things which periſh, or are parted with in the uſe, and can therefore only be reſtored in kind. The queſtions pertaining to this claſs of contracts are few and ſimple, and admit of an eaſy and obvious ſolution. If the thing lent be loſt, or damaged by the uſe, or by accident in the uſe for which it was lent, the lender ought to bear the loſs or damage. With regard to the loan of money, there exiſts no reaſon in the law of nature, why a man ſhould not be paid for the uſe of his money lent, as well as of any other property into which the money might be converted. (See INTEREST and USURY.) For contracts of labour, ſee SERVANT, COMMISSION, AGENT, FACTOR, STEWARD, ATTORNEY, and ADVOCATE. See alſo PARTNERSHIP. Under this head it may be obſerved, that in many offices, as ſchools, fellowſhips of colleges, profeſſorſhips of the univerſities, and the like, there is a two-fold contract; one with the founder, and the other with the electors. The contract with the founder obliges the incumbent of the office to diſcharge every duty appointed by the charter, ſtatutes, deed of gift, or will of the founder; becauſe the endowment was given, and conſequently accepted, for that purpoſe, and upon thoſe conditions. The contract with the electors extends this obligation to all duties that have been *cuſtomarily* connected with, and reckoned a part of, the office, though not preſcribed by the founder; for the electors expect from the perſon they chuſe all the duties which his predeceſſors have diſcharged; and as the perſon elected cannot be ignorant of their expectation, if he mean to refuſe this condition, he ought to appriſe them of his objection. Here it ſhould be obſerved, that the electors can excuſe the conſcience of the perſon elected from this claſs of duties only; becauſe this claſs reſults from a contract, to which the electors and the perſon elected are the only parties. The other claſs of duties reſults from a different contract; and with reſpect to theſe a queſtion ariſes of delicate inveſtigation, and of difficult ſolution, *viz.* how far the incumbent of an office may be allowed to deviate from the will of the founder, and to ſuppoſe him placed in circumſtances ſimilar to his own, and, in this new ſtate of things, capable of forming a different judgment, and equally diſpoſed to adapt his regulations and injunctions to the change of circumſtances, which, in the courſe of ages, has occurred?—The beſt mode of eaſing the conſciences of incumbents, in caſes of this kind, is to introduce a reformation in many antiquated eſtabliſhments, and in the laws, already obſolete, and, as it were, quieſcent, by which they were deſigned by their unenlightened, but liberally diſpoſed, founders to be regulated. Few of theſe contracts, to which we now refer, have, we conceive, been liberally and punctually fulfilled in modern times; and it would be unqueſtionably more conducive to the honour and uſefulneſs of ancient inſtitutions, and of official incumbents, to aboliſh regulations, which it is not thought proper to obſerve. It has been a queſtion of ſome magnitude and difficulty, what offices may be conſcientiouſly ſupplied by a deputy. A deputy, according to archdeacon Paley, may be allowed in all caſes, to which the following objections do not apply: 1. Where a particular confidence is repoſed in the judgment and contract of the perſon appointed to it; as the office of a ſteward, guardian, judge, commander in chief by land or ſea. 2. Where the cuſtom hinders; as in the caſe of ſchoolmaſters, tutors, and of commiſſioners in the army or navy. 3. Where the duty cannot, from its nature, be ſo well performed by a deputy; as the deputy-governor of a province may not poſſeſs the legal authority, or the actual influence of his principal. 4. When ſome inconvenience would reſult to the ſervice in general from the permiſſion of deputies in ſuch caſes; *e. g.* it is probable that military merit would be much diſcouraged, if the duties belonging to commiſſions in the army were generally allowed to be executed by ſubſtitutes. In this connection, the non-reſidence of the parochial clergy, who ſupply the duty of their benefices by curates, preſents itſelf to conſideration; but as it will require a more diſtinct diſcuſſion, we refer to the article NON-RESIDENCE. On the ſubject of this article, ſee Paley's Principles of Moral and Political Philoſophy, vol. i. p. 142—163.

CONTRACT is particularly uſed in *Common Law*, for an agreement or covenant between two or more perſons, with a lawful conſideration or cauſe. As, if I ſell my horſe for money; or covenant in conſideration of 20*l.* to make you a leaſe of a farm; theſe are good contracts, becauſe there is *quid pro quo*, or one thing for another. Or, a contract, which uſually conveys an intereſt merely in action, may be thus defined: "An agreement upon ſufficient conſideration, to do or not to do a particular thing." In all contracts, therefore, our attention is directed to three points, *viz.* the agreement, the conſideration, and the thing to be done or omitted, or the different ſpecies of contracts. In a contract, conſidered as an agreement, a mutual bargain, or convention, there muſt be at leaſt two contracting parties, of ſufficient abilities to make a contract, as where A. contracts with B. to pay him 100*l.*, and thereby transfers a property in ſuch ſum to B. This property, however, is not in poſſeſſion, but in action merely, and recoverable by ſuit at law; ſo that it could not be transferred to another perſon by the ſtrict rules of the ancient common law, for no choſe in action could be aſſigned or granted over. See CHOSE *in action.*

This contract or agreement may be either *expreſs* or *implied.* *Expreſs* contracts are where the terms of the agreement are openly uttered and avowed at the time of the making, as to deliver an ox, or ten load of timber, or to pay a ſtated price for certain goods. *Implied* are ſuch as reaſon and juſtice dictate, and which, therefore, the law preſumes that every man undertakes to perform. There is one ſpecies of implied contract, which runs through and is annexed to all other contracts, conditions, and covenants, *viz.* that if I fail in my part of the agreement, I ſhall pay the other party ſuch damages as he has ſuſtained by ſuch my neglect or refuſal. In ſhort, almoſt all the rights of perſonal property (when not in actual poſſeſſion), do in great meaſure depend upon contracts of one kind or other, or at leaſt might be reduced under ſome of them; and this is the method taken by the civil law, which has referred the greateſt part of the duties and rights, of which it treats, to the head of obligations *ex contractu*, and *quaſi ex contractu.* (Inſt. 3. 14. 2.) See ASSUMPSIT.

A contract may alſo be either *executed,* as if A. agree to change horſes with B., and they do it immediately; in which caſe the poſſeſſion and the right are transferred together:—or it may be *executory*, as if they agree to change next week; in which caſe the right only veſts, and their reciprocal property in each other's horſe is not in poſſeſſion but in action:—for a contract *executed* (which differs nothing from a grant) conveys a *choſe in poſſeſſion*; a contract *executory* conveys only a *choſe in action*. For an account of the *conſideration*, upon which a contract is founded, ſee Consideration.

A conſideration of ſome ſort or other is ſo abſolutely neceſſary to the forming of a contract, that a *nudum pactum*, or agreement to do or pay any thing on one ſide, without any compenſation on the other, is totally void in law, and a man cannot be compelled to perform it. However a man may or may not be bound to perform ſuch a contract, in honour or conſcience, which the municipal laws do not decide, it is certain that theſe laws will not compel the execution of what he has no viſible inducement to engage for:—and, therefore, our law has adopted the maxim of the civil law, that *ex nudo pacto non oritur actio*. (Cod. 2. 3. 10. & 5. 14. 1. Br. & St. d. 2. c. 24. Bro. Abr. tit. de te, 79. Salk. 129.) But any degree of reciprocity will prevent the pact from being nude; nay, even if the thing be founded in a prior moral obligation, (as a promiſe to pay a juſt debt, though barred by the ſtatute of limitations,) it is no longer *nudum pactum*. And as this rule was principally eſtabliſhed to avoid the inconvenience that would ariſe from ſetting up mere verbal promiſes, for which no good reaſon could be aſſigned (Plowd. 308, 309.), it therefore does not hold in ſome caſes, where ſuch promiſe is authentically proved by written documents. For if a man enters into a voluntary bond, or gives a promiſſory note, he ſhall not be allowed to aver the want of a conſideration in order to evade the payment; for every bond, from the ſolemnity of the inſtrument (Hardr. 200. 1. Ch. Rep. 157.), and every note from the ſubſcription of the drawer (Lord Raym. 760.), carries with it an internal evidence of a good conſideration. Courts of juſtice will, therefore, ſupport them both, as againſt the contractor himſelf; but not to the prejudice of creditors, or ſtrangers to the contract.

The moſt uſual contracts, by which the rights of chattels perſonal may be acquired by the laws of England, are thoſe of *ſale* or *exchange*, of *bailment*, of *hiring* and *borrowing*, and of *debt*. See theſe articles reſpectively. See alſo Interest and Usury, Bottomry and Respondentia, Insurance, and Annuity.

Every contract, whatever be its nature, implies in itſelf an *aſſumpſit* in law, for the performance of it; for a contract would be to no purpoſe, if there were no means to enforce its performance. See Assumpsit.

A diverſity occurs where a day of payment is limited in a contract, and where it is not ſo limited. In the former caſe, the contract is good preſently, and an action lies upon it, without payment; but in the latter, it is otherwiſe. Thus, if a man buy any commodity, the contract is void, if he do not pay the money preſently; but if a day of payment be ſtipulated, there the one may have an action for the money, and the other trover for the commodity. (Dyer, 30. 293.) Where a ſeller ſays to a buyer, he will ſell his horſe for a ſpecified ſum, and the buyer ſays he will give it; if he preſently tell out the money, it is a contract; but if he do not, it is no contract. (Noy's Max. 87. Hob. 41.) The property of any thing ſold is immediately in the buyer by the contract; though regularly it muſt be delivered to the buyer, before the ſeller can bring his action for the money. (Noy, 88.) If a perſon contract to buy a horſe, or any thing elſe, of another, and no money is paid, or earneſt given, nor day ſet for payment, nor the thing delivered,; in theſe caſes, no action will lie for the money, or the thing ſold, but it may be ſold to another. (Plowd. 128. 309.) All contracts are to be certain and complete. For an agreement to give ſo much for a thing as it ſhould be reaſonably worth, is void on account of its uncertainty: ſo is alſo a promiſe to pay money in a ſhort time, &c. or to give ſo much, if a perſon likes the thing when he ſees it. (Dyer, 91. 1 Bulſt. 92.) But if I contract to give another 10*l.* for ſuch a thing, if I like it on ſeeing the ſame; this bargain is ſaid to be perfect at my pleaſure, though I may not take the thing before I have paid the money:—if I do, the ſeller may have treſpaſs againſt me: and if he ſell it to another, I may bring an action on the caſe againſt him. (Noy, 104.) If a contract be to have for cattle ſold 10*l.*, if the buyer do a certain thing, or elſe to have 20*l.* it is a good, and ſufficiently certain contract. Alſo, if I agree with a perſon to give him ſo much for his horſe, as A. B. ſhall judge him to be worth, when he hath judged it, the contract is complete, and an action will lie on it: and the buyer ſhall have a reaſonable time to demand the judgment of A. B. But if he die before the judgment is given, the contract is determined. (Perk. ſect. 112, 114. Shep. Abr. 294.) In contracts, the time is to be regarded, in and from which the contract is made; the words ſhall be taken in the common and uſual ſenſe; and the law doth not ſo much regard the form of words, as the ſubſtance, and the mind of the contracting parties. (5 Rep. 83. 1 Bulſt. 175.) A contract for goods may as well be made by word of mouth, as by deed in writing; and where it is merely written, but not ſealed and delivered, it is the ſame as if it were verbal. But if the contract be by writing ſealed and delivered, and ſo converted into a deed, it is of another nature; and in this caſe generally the action on the verbal contract is gone, and ſome other action lies for the breach of it. (Plowd. 130, 309. Dyer, 90.) Contracts, not to be performed in a year, are to be in writing, ſigned by the party, &c., or no action may be brought on them; but if no day is ſet, or the time is uncertain, they may be good without it. (Stat. 29 Car. II. c. 3.) And by the ſame ſtatute, no contract for the ſale of goods for 10*l.* or upwards, ſhall be good, unleſs the buyer receive part of the goods ſold, or give ſomething in earneſt to bind the contract; or ſome note thereof be made in writing, ſigned by the perſon charged with the contract. See Sale.

Contract, *nude* and *quaſi*. See the adjectives, and Contract *ſupra*.

Contract, *Simple*. See Simple and Debt.

Contract, *Special*. See Specialty and Debt.

Contract, *uſurious*, is a contract to pay more intereſt for money than the laws allow.

It is a devaſtavit in executors to pay a debt upon an uſurious contract. See Usury.

Contract *of Marriage*. The Romaniſts diſtinguiſh the civil contract, which is the conſent of the parties, from the *ſacrament*, which is the benediction of the prieſt.

Thoſe contracts are ſaid to be *null*, which the law prohibits: ſuch are all contracts between perſons incapable of contracting, as minors, religious, lunatics, wives without conſent of their huſbands, &c.

In order to a good civil marriage, the parties muſt not only be willing and able to contract, but actually muſt contract themſelves in due form of law. Any contract made, *per verba de præſenti*, or in words of the preſent tenſe, and in caſe of cohabitation *per verba de futuro* alſo, between perſons able to contract, was before the act (26 Geo. II. c. 33.) deemed a valid marriage to many purpoſes; and the parties might be compelled in the ſpiritual courts to celebrate it *in facie eccleſiæ*. But theſe verbal contracts are now of no force, to compel a future marriage. See Marriage.

Contract, *Original*, in *Engliſh Hiſtory*, denotes that reciprocity of protection and ſubjection, which ſubſiſts between the king of Great Britain and his ſubjects. The duties reſulting from hence are what, according to judge Blackſtone, (Comm. vol. i.) were meant by the convention in 1688, when they declared that king James had broken the "original contract" between king and people. But however, as the terms of that original contract were in ſome meaſure diſputed, being alleged to exiſt principally in theory, and to be only deducible by reaſon and the rules of natural law; in which deduction different underſtandings might very conſiderably differ; it was, after the revolution, judged proper to declare theſe duties expreſsly, and to reduce that contract to a plain certainty. So that, whatever doubts might be formerly raiſed by weak and ſcrupulous minds about the exiſtence of ſuch an original contract, they muſt now entirely ceaſe, eſpecially with regard to every prince, who hath reigned ſince the year 1688. As to the terms of the original contract between king and people, theſe the learned judge apprehends to be now couched in the *coronation oath*; which ſee. See alſo Constitution and King.

Contract is alſo uſed for the inſtrument in writing, which ſerves as a proof of the conſent granted, and the obligation paſſed between the parties.

Among the ancient Romans, contracts, and all voluntary acts, were written, either by the parties themſelves, or by one of the witneſſes, or by a domeſtic ſecretary of one of the parties, whom they call a *notary*; but who was no public perſon, as among us.

The contract, when finiſhed, was carried to a magiſtrate, who gave it a public authority by receiving it *inter acta*, into the number of the acts under his juriſdiction; giving each of the parties a copy thereof, and ſealed with his ſeal. Which practice paſſed into France, where it obtained a long time. The conſcientious performance of private contracts between man and man is frequently recommended in the Koran. For the prevention of diſputes, all contracts are directed to be made before witneſſes, and in caſe ſuch contracts are not immediately executed, the ſame ought to be reduced into writing in the preſence of at leaſt two witneſſes, (which ſeems to have been alſo required by the Jewiſh law, even in caſes where life was not concerned,) who ought to be Moſlems and of the male ſex; but if two men cannot be conveniently had, then one man and two women may ſuffice. The ſame method is alſo directed to be taken for the ſecurity of debts to be paid at a future day; and where a writer is not to be found, pledges are to be taken. Hence, if people truſt one another without writing, witneſſes, or pledge, the party on whom the demand is made is always acquitted if he denies the charge on oath, and ſwears that he owes the plaintiff nothing, unleſs the contrary be proved by very convincing circumſtances. Sale's Koran, Introd. p. 139.

Contracts, in *Rhetoric*, furniſh one head or claſs of external arguments. (See Argument and Topics.) In this view of them, they are either public or private. Public contracts denote tranſactions between different ſtates, as leagues, alliances, and the like; which depend on the laws of nations. Thoſe are called private, which relate to leſſer bodies, or ſocieties of men, and ſingle perſons, and they may be either written or verbal. With reſpect to the force and obligation of contracts, the Roman law declares, that "nothing can be more agreeable to human faith, than that perſons ſhould ſtand to their agreements." Therefore in controverſies relating to this kind of human teſtimony, the party, whoſe intereſt it is, that the contract ſhould be maintained, will plead, that ſuch covenants have the force of private laws, and ought religiouſly to be obſerved, ſince the common affairs of mankind are tranſacted in that manner; and therefore to violate them is to deſtroy all commerce and ſociety among men. On the other ſide it may be ſaid, that juſtice and equity are chiefly to be regarded, which are immutable; and beſides, that the public laws are the common rule to determine ſuch differences, which are deſigned to redreſs thoſe, who are aggrieved. Indeed, where a compact has been obtained by force or fraud, it is in itſelf void, and has no effect either in law or reaſon. But on the other hand, the Roman lawyers ſeem to have very rightly determined, that all ſuch obligations, as are founded in natural equity, though not binding by national laws, and are therefore called "nuda pacta," ought however in conſcience and honour to be performed.

CONTRACTED vein, in *Hydraulics*, (*Vena contracta* of Newton,) is a name given to the contraction which has been obſerved in a ſtream of fluid iſſuing out of an aperture. When water, or other fluid analogous to water, iſſues out of an aperture in the thin ſide or bottom of a veſſel containing that fluid, as at A, *fig.* 1 and 2; *Plate* I. *Hydraulics*, the ſize of the aperture being very ſmall in proportion to the ſide or bottom of the veſſel, the ſtream A B is not of the ſame ſhape throughout its whole length, nor is it of an uniform ſize. When the aperture is circular, the diſtance of the narroweſt part of the ſtream, from the inſide ſurface of the veſſel, is about equal to the radius of the aperture. This narroweſt part of the ſtream has been called *the contracted vein*; the whole ſtream itſelf having been uſually denominated *the vein of fluid*, by writers on the ſubject. From the place of the contracted vein forwards, the ſtream enlarges its dimenſions, and ſometimes divides itſelf into different ſmaller ſtreams. The diameter of the contracted vein, or narroweſt part of the ſtream, is ſubject to a little variation, ariſing from the ſize of the veſſel in proportion to the aperture, and partly from the *charge* of the veſſel, (*viz.* from the height of fluid in the veſſel above the level of the aperture); hence the diameter of the contracted vein, as meaſured by different authors, has not turned out exactly of one invariable dimenſion; the difference, however, is not very material; as appears from the following table, which contains the different meaſurements of the contracted vein; calling the diameter of the circular aperture *one*.

Authors of the experiments.	*Diameter of the contracted vein.*
Poleni (de Caſtellis, § 35.) . - -	0.790
Michelotti; Sperim. Idraul. tom. II. Exp. 4.	0.800
Boſſut (Hydrodyn. art. 437. Exp. 5.) -	0.818
Venturi, with 35 inches charge, and an horizontal circular orifice of 18 lines in diameter - - - -	0.798

From a mean of the above meaſurements, it may be concluded, that the diameter of the contracted vein is little more than eight-tenths of the diameter of the aperture. That ſhort part of the ſtream which ſtands between the aperture and the greateſt contraction, is not uniformly conical, but it approaches to the figure of an hyperbolic conoid.

This contraction of the ſtream is undoubtedly owing to the different directions, and different velocities, with which the various parts (or, as they are called, *filaments*) of the fluid run towards the aperture, as is indicated by the *figs.* 1 and 2. Hence it has been obſerved, that when the aperture is very large in proportion to the ſize of the veſſel, the contraction of the ſtream is leſs evident. And ſuch, alſo, is in great meaſure the caſe, when the ſide of the veſſel in which the aperture is made, is not very thin.

The various filaments of the fluid, which run from every part of the veſſel in oblique directions towards the aperture, partly croſs each other at the contracted vein; and this croſſing, or tendency to croſs, is one of the cauſes which enlarge the ſtream beyond that place. It is evident, that with apertures of different ſhapes, the form of the contracted vein, that is of the ſtream of that place, muſt vary conſiderably. But profeſſor Venturi, deſirous of determining the effects of ſome of thoſe variations from the circular ſhape, made the following experiments with orifices of peculiar ſhapes.

“ In the orifice A B C D, (*fig.* 3.) the two ſides A, B, are parallel to the horizon; the extremities are rounded; the width of this aperture is leſs than two lines, its length 18 lines, and the charge 32.5 inches. The ſection of the ſtream which iſſues from this orifice, firſt aſſumes the form E F, after which, the two extremities E, F, approaching nearer and nearer to enlarge the middle part of the ſection of the ſtream, at 4.5 inches diſtance from the orifice, acquire the quadrangular form G H. The ſtream afterwards extends itſelf in the perpendicular direction, in the form of a large fan K L. I have repeated the experiment, by placing the longitudinal axis of the orifice C D vertically. In this caſe the ſame phenomena were produced, E F becoming vertical, and K L horizontal, both preſerving their form.”

“ The fluid filaments, which, iſſuing out of the orifice, paſs near the two oppoſite borders A, B, are very near each other, and becoming convergent, they tend to unite at a very ſhort diſtance from the orifice itſelf. The filaments C, D, are more remote, and, perhaps, leſs convergent; they cannot unite but at a greater diſtance than the two former. In this caſe, therefore, there are movements which tend to form two contractions, the one nearer, and the other more remote from the orifice; theſe two contractions counter balance each other in part. Their mutual oppoſition carries the effect, G H, to a diſtance five times greater than that of the contracted vein of a circular orifice, having a diameter of the ſame breadth as that of this orifice.”

“ In this experiment we ſee the cauſe of a phenomenon, which has been obſerved in ſome particular caſes by Poleni and others, without giving the explanation. In every orifice of a right-lined figure through a thin plate, the angles of the contracted vein anſwer to the ſides of the orifice and the contrary. When the quadrangular orifice has the ſituation M N O P, the greateſt contraction of the ſtream is made at a greater diſtance than in a circular aperture; it aſſumes the form and ſituation Q R S T. The reaſon is, that the oppoſite angles M, P, are more remote from each other, than the ſides I, V, whence the ſame thing happens as in the long orifice A C B D. In the ſame manner, the triangular orifice in the ſituation X, produces a contraction of the form, and in the ſituation Z, &c.”

When the horizontal oblong aperture, C D, (*fig.* 3.) was uſed, the diſtance of the contracted vein from that orifice, was found to vary with the height of the fluid; as ſhewn in the following table; from which it appears, that the contraction of the ſtream takes place at a greater diſtance, under ſtrong charges, than in thoſe which have but little elevation.

Height of the charge above the orifice C D.	Diſtance of the greateſt contraction G H.

10.	40.
6.	36.

If a cylindrical tube be fitted to a circular aperture in the ſide of the reſervoir, or veſſel containing the fluid, and part of it be puſhed into the interior part of that veſſel, the contraction of the vein will be greater, and the quantity of fluid that runs out in a given time, will be leſs, than without ſuch tube. If to the external part of the circular orifice, a ſhort tube be adapted exactly of the ſhape of the contracted vein, or very nearly ſo, as in *fig.* 4, (it being a tube nearly conical, but with its ſides a little convex inwardly,) the quantity of fluid that runs out in a given time, will be the ſame, or very nearly the ſame, as when the ſimple aperture is uſed, without ſuch tube.

The velocity of the fluid is far from being the ſame in every part of the ſtream; for ſince the ſame quantity of fluid muſt paſs through every tranſverſe ſection of the ſtream in a given time, it follows, that the velocity muſt be inverſely as the area of each tranſverſe ſection. Therefore the velocity at the contracted vein is greater than at the circular aperture; and ſince the areas of the ſections at thoſe two places, are as the ſquares of their diameters, and the diameter of the contracted vein is to that of the circular aperture nearly as eight to ten, or as four to five; hence we ſay, as 16 is to 25, ſo is the velocity at the aperture, which we ſhall call *one*, to the velocity at the vena contracta; that is, as one to 1.56.

CONTRACTILE Force, that property, or power, inherent in certain bodies, whereby, when extended, they are enabled to draw themſelves up again to their former dimenſions. For the cauſe of this property, which is of the utmoſt conſequence to a right underſtanding of the animal œconomy, ſee Fibre.

CONTRACTION, in *Surgery*, from *contraho*, to draw together; a rigid or ſtiffened ſtate of any part in the body, but eſpecially of the joints. This rigidity may ariſe from a morbid condition, either of the bones, ligaments, or muſcles; and may proceed from a great variety of cauſes. Cullen has given four ſpecies of contractions; but Sauvages has multiplied them to the number of eleven! The ſurgeon who knows the cauſe and ſeat of this complaint, will not, however, pay much regard to thoſe noſological diſtinctions, in his method of cure. If the morbid change ariſes from inflammation and thickening of the parts affected, he will uſe diſcutient remedies, fomentations, and emollient poultices; or, after the inflammatory ſtage has ſubſided, he will employ electricity, friction, ſtimulant embrocations, and moderate extenſion of the affected muſcles, &c. If the rigidity be very obſtinate, and the ligaments yield with great difficulty, the ſurgeon will uſe mechanical force more freely, and perhaps will enjoin the exerciſe of alternate bending and ſtraightening the limb, by means of pulleys or ſteel ſprings, beſides the occaſional adminiſtration of the vapour-bath, or hot ablutions. The principles of the art being underſtood, and the nature of the caſe which comes before us, it will not be difficult, by ſteady perſeverance, to overcome a great number of obſtacles which preſent themſelves, in the treatment of contractions.

When the diſeaſe is occaſioned by an union of the bones which form a joint, the mobility of the limb is not to be expected. This ſpecies of contraction is named *anchyloſis*, and is explained at large in a ſeparate article of this work. (See Anchylosis,) When one muſcle is found in a ſtate of permanent contraction, *e. g.* the ſterno-maſtoid of the neck, it is ſometimes requiſite to divide the muſcle in order to effect the cure. (See Distortion *of the neck*). We underſtand that Mr. Carpue, ſurgeon of his majeſty's forces, has invented many ingenious mechanical inſtruments, which will ſoon be made public, for the relief of this claſs of diſeaſes.

Contraction, in *Grammar*, the reduction of two vowels, or ſyllables, into one; as, *may'nt*, for *may not*; *ſhould'ſt*, for *ſhouldeſt*, &c.

The Greeks abound with contractions, both in their verbs and their nouns.

In this language, two ſimple vowels concurring in the ſame word are generally combined into a diphthong; and in this caſe the concurrent vowels are ſaid to be contracted. Contraction is either *ſimple* or *compounded*; *ſimple*, when conſtituent vowels are retained unchanged; and *compounded*, when a new ſound reſults. *E. G.* The contraction of τειχεϊ into τειχεῖ is ſimple; that of τειχεος into τειχους is compounded. The firſt ſort of contractions is called *ſynæreſis*, the ſecond *craſis*. When two ſucceeding vowels have dots above them, they are ſeparately ſounded; but when contracted, they have over them the circumflex accent; hence τειχεϊ has three ſyllables, but τειχεῖ only two. Every contraction, whether ſimple or compounded, is the coalition of two ſhort vowels; and it takes place in nouns of every declenſion, in adjectives, in verbs, and in the combination of the article and prepoſitions with the ſucceeding words. Simple contractions are all reducible to the following rule.—Let the concurring vowels, inſtead of being ſounded ſeparately, be expreſſed by a ſingle impulſe of the voice; αι ᾶι, αυ ᾶυ, ει εῖ, &c. The difficulty lies in the compounded contractions; but all the varieties of theſe may be comprehended under the four ſucceeding caſes. 1. If the two ſhort vowels to be contracted be the ſame, they are already repreſented by one of them lengthened. Thus αα, ιι, εε, are contracted into ᾶ, ῖ, ῆ, reſpectively. Note, however, that, in the common tongue, the contraction of εε is not into ῆ, but into its equivalent εῖ: and the contraction of οο is not into ω, but into ου. 2. If the concurrent vowels be not the ſame, that which is predominant in ſound prevails over that which is ſubordinate to it. The predominant vowel muſt in moſt inſtances be the prepoſitive; ſince this pre-occupies the organs, and thus demands a fuller enunciation. The ſubjunctive, therefore, is loſt in the contraction; and its only effect is to lengthen the prepoſitive, when a *doubtful vowel*, but to convert it, if *ſhort* by nature, into its correſpondent long one. Hence αε, εα, οα, and οε are contracted into ᾶ, ῆ, ω, and ω reſpectively. The exceptions to the above principle are the following: verbs in μι of the firſt claſs, in order to be diſtinguiſhed from the third perſon plural, have in the three ſingular, αε contracted into η. The diphthongs εα, οα, when ſucceeded by ς are contracted, the former into ει, and the latter into ου. If a vowel, or ρ, precede εα, they are contracted into α. By attention to the pronunciation of ο, α, ε, it will be perceived that the firſt, having a fuller ſound, predominates over the ſecond and third; and, therefore, αο are contracted, not into ᾶ, but into ῶ. In the concurrent vowels εο, the latter prevails in ſound over the former, and conſequently, the contraction is into ου, not into ω. Conformably to the ſecond caſe οε would be contracted into ω; but its contraction, in the common tongue, like that of εο, is generally into ου. 3. The vowels ιυ, being predominant in ſound, and from their nature incapable of coaleſcing with thoſe ſubjoined to them, cauſe the ſubjunctive to be expelled: as ιεραξ, ιραξ, a hawk, οφιας, οφις, a ſerpent, ιχθυας, ιχθῦς, fiſhes, &c. 4. As the contraction is the union of two ſhort vowels into one compound ſound, it follows, that a ſhort vowel preceding a long one, as having no effect in lengthening a ſound which does not admit of different degrees of length, is dropped in the contracted form; as Απελλεης, Απελλῆς, Apelles, Βασιλεων, Βασιλῶν, kings, τιμαω, τιμω, I honour, &c. When a vowel precedes a diphthong, it is either itſelf rejected, or it cauſes to be rejected one of the conſtituents of that diphthong: thus, α preceding ει, ου, expels the ſubjunctives ι, υ; but preceding οι, α is itſelf rejected. In like manner, ε is rejected, when preceding ει, οι, or ου. When ο precedes ει, it requires in nouns and adjectives the rejection of the ſubjunctive: alſo in the infinitive mood of verbs in οω, ο preceding ει requires ι to be rejected; but in the ſecond and third perſons ſingular indicative, the prepoſitive is dropped. Before οι and ου, ο is itſelf rejected. In the adjectives απλοη ſimple, διπλοη double, ο is expelled;—thus, απλῆ, διπλῆ. See Jones's Grammar of the Greek Tongue, on a new and improved Plan, part ii. chap. 1.

Contraction, in *Logic*, or *Compoſition*, a ſpecies of reduction, wherein the thing that reduces does alſo abridge, or bring the thing reduced into a leſſer compaſs.

The deſign of contraction is to bring things, which before were too lax and diffuſive, nearer together; that ſo their mutual relation may appear the more clearly, and they may better ſtrengthen and ſupport each other.

To this head are referred the arguments, as they are called, of poems and orations; the titles and ſummaries of chapters, &c. See Abridgment.

Contraction, in a general ſenſe, means diminution of the bulk, or extent, of any thing; the nearer approach of its parts to one another. This word is generally uſed in philoſophy, in ſurgery, in grammar, in the arts, &c. In philoſophy the contractions moſtly noticed, are thoſe which ariſe from a diminution of temperature. The ſhortening of the dimenſions of a body is the general effect; but at certain periods of their contraction, bodies change their apparent ſtate of exiſtence; thus the vapour of water is contracted by a diminution of temperature from a higher degree, down to about 212° of Fahrenheit's ſcale; but below that degree, its contraction is very great, and it is thereby converted into fluid water, in which ſtate it occupies not more than about the 1800th part of the ſpace it took up a little before its converſion into water. Similar phenomena are to be obſerved with moſt other bodies, and the particulars which need be remarked concerning them, are the rate, the quantity, and the limits of contraction in different bodies. But thoſe particulars being the reverſe of the phenomena which are deſcribed under the denomination of *expanſion* or *dilatation*, are with more perſpicuity ſtated under thoſe articles, to which the reader is referred. It is, however, neceſſary in this place briefly to ſtate a few particulars which ſeem leſs regular, and ſome which ariſe, not from a ſimple cauſe, but from the compound effect of preſſure, and of diminution of temperature.

"When an elaſtic fluid is contracted by cold within certain limits, determined by a degree of preſſure to which it is expoſed, as well as by the nature of the fluid, its particles become ſubjected to the force of coheſion; they ruſh ſtill nearer together, and form a liquid. Thus, when ſteam under the common atmoſpheric preſſure, is cooled below the heat of boiling water, it is inſtantly condenſed, and becomes water; but with a preſſure of two atmoſpheres, it would be condenſed at a temperature 36° higher, and with the preſſure of half our atmoſphere only, it might be cooled without condenſation 33° lower than the common temperature of boiling water. And ſimilar effects take place in vapours of other kinds at higher or lower temperatures, a double preſſure producing, in all caſes, an equal diſpoſition to condenſation, with a depreſſion of temperature of between 20 and 40 degrees, and moſt commonly of about 35° of Fahrenheit. Thus the vapour of ſpirit of wine is uſually condenſed at 175° of Fahrenheit; but with a double preſſure it is condenſed at a temperature 39° higher; and with the preſſure of half an atmoſphere, at a temperature 35° lower; and the vapour of either, which is commonly condenſed at 102°; requires a temperature 38° higher, with a double preſſure, or as much lower with half the uſual preſſure. If the temperature be below the freezing point of the liquid, the preſſure being ſufficiently leſſened the vapour may ſtill retain its elaſticity, but a further reduction of temperature or increaſe of preſſure will convert it immediately into a ſolid."

Water, and all aqueous fluids, are gradually contracted by a diminution of temperature, until they arrive at a certain point which is about eight degrees above the freezing point; but below that point they begin to expand and continue to do ſo according as their temperature is lowered. Effects nearly ſimilar have been obſerved with a few metallic ſubſtances.

Speaking of contraction, a remarkable phenomenon, of conſiderable importance in manufactures, obtrudes itſelf on our notice. It is the hardneſs which certain bodies acquire in conſequence of a ſudden contraction, and this is particularly the caſe with glaſs and ſome of the metals. Thus glaſs veſſels ſuddenly cooled after having been formed are ſo very brittle, that they hardly bear to be touched with any hard body. The cauſe of this effect is thus properly explained by Dr. Young. "When glaſs in fuſion is very ſuddenly cooled, its external parts become ſolid firſt, and determine the magnitude of the whole piece; while it ſtill remains fluid within. The internal part, as it cools, is diſpoſed to contract ſtill further, but its contraction is prevented by the reſiſtance of the external parts, which form an arch or vault round it, ſo that the whole is left in a ſtate of conſtraint; and as ſoon as the equilibrium is diſturbed in any one part, the whole aggregate is deſtroyed. Hence it becomes neceſſary to anneal all glaſs, by placing it in an oven, where it is left to cool ſlowly; for, without this precaution, a very ſlight cauſe would deſtroy it. The Bologna jars, ſometimes called proofs, are ſmall thick veſſels, made for the purpoſe of exhibiting this effect; they are uſually deſtroyed by the impulſe of a ſmall and ſharp body, for inſtance, a ſingle grain of ſand, dropped into them, and a ſmall body appears to be often more effectual than a larger one; perhaps becauſe the larger one is more liable to ſtrike the glaſs with an obtuſe part of its ſurface." See *Prince* Rupert's *Drops*.

The hardening of ſteel is an effect of the ſame ſort. The piece of ſteel is made red-hot, and, in that ſtate, is ſuddenly cooled and contracted by immerſion in water; in conſequence of which it remains ſo brittle and hard, as not to ſuffer its being filed or hammered. If, inſtead of water, the piece of red-hot ſteel be plunged in oil, its contraction is not ſo ſudden, and of courſe its hardneſs will not be ſo great. If it be plunged in quickſilver, which cools it much quicker than water, its hardneſs becomes ſo great as to render it capable of cutting or ſcratching glaſs like a ſilicious body. But, on the other hand, if the piece of ſteel, after its having been rendered red-hot, be ſuffered to contract gradually in the air; then its texture will eaſily yield to the hammer or to the file.

The neceſſity and importance of attending to the minute variations in the bulk of bodies by heat and cold, was never before, perhaps, ſo ſtrikingly exemplified, as in the government Trigonometrical Survey, begun under general Roy, in the year 1784, by the meaſurement of a baſe of 27404.3 feet in length on Hounſlow Heath, near London. This was firſt meaſured by long deal rods, which were ſoon laid aſide, on account of their great and variable contraction and expanſion, and long glaſs rods or tubes were next tried wherein the ſum of the expanſions of the rods, during the operation, reduced to 62° of Fahrenheit's thermometer, amounted to 6 inches very nearly, and of the contractions to 1.8 inch nearly, making an addition of 4.2 inches to the length of the baſe, as meaſured by the glaſs rods, on account of their expanſion and contraction during the operation; ſee Phil. Tranſ. 1785, p. 477. In 1791, this baſe was remeaſured with a ſteel chain made for the purpoſe by Ramſden, with all imaginable attention to accuracy, and the correction neceſſary to be applied to the length of the baſe, on account of the exceſs of the expanſions over the contractions of the chain during the operation, was found to be 34.2 inches, but from which 27.11 inches was afterwards deducted, for reducing the baſe to the length which would have reſulted, from a meaſurement in the temperature of 62°, to which point of the thermometer's ſcale all lengths in this ſurvey are ſuppoſed to be reduced. See Phil. Tranſ. 1795, p 433.

Contraction *of Strata*, in *Natural Hiſtory*. That clay and argillites have contracted during their hardening in the ſtrata of the earth, Mr. Bergman infers from having obſerved, that the petrified ſhells found in theſe are commonly compreſſed and flatted, and that argil hardens by contraction, but thoſe found in lime-ſtone retain their primitive ſhape, becauſe theſe harden chiefly by infiltration.

Contraction is frequently uſed, by anatomical writers, to expreſs the ſhrinking up of a fibre, or an aſſemblage of fibres when extended.

Convulſions and ſpaſms proceed from a preternatural *contraction* of the fibres of the muſcles of the part convulſed.

On the contrary, paralytic diſorders generally proceed from a too great laxneſs of the fibres of the parts affected; or from the want of that degree of *contraction* neceſſary to perform the natural motion or action of the part.

In the firſt, therefore, the animal ſpirits are ſuppoſed to flow either in too great a quantity, or irregularly; and, in the laſt, the animal ſpirits are either denied a free paſſage into the part affected, or the tenſion of the fibrillæ is ſuppoſed inſufficient to promote the circulation.

Contraction evidently appears to be the true natural ſtate of all muſcles; for, if a muſcle be at any time freed from the power of its antagoniſt, it is immediately found to *contract*; and is not, by any action of the will, or the ſpirits, to be reduced to a ſtate of dilatation.

Contraction *of the heart*, *arteries*, *lungs*, *&c.* See Systole, Heart, Artery, Pulse, &c.

CONTRADICENTE. See Nemine *contradicente*.

CONTRADICTION, a ſpecies of direct oppoſition, wherein one thing is found diametrically oppoſite to another.

The ſchoolmen uſually define it, *oppoſitio inter ens & non-ens medio carens*: where, by *ens*, and *non-ens*, are underſtood any two extremes, whereof one affirms, and the other denies; and it is ſaid to be *medio carens* to diſtinguiſh it from the other ſpecies of compoſition; the extremes, here, neither agreeing in ſubject, as is the caſe in privation; nor in eſſence and kind, as in contrariety.

Contradiction, *freedom of.* See Freedom.

Contradiction, *imply a.* See Imply.

CONTRADICTOR, in a legal ſenſe, a perſon who has a right or title to contradict or gainſay.

An inventory of the effects of a minor ought to be made in preſence of his guardian, or truſtee, who is the legal *contradictor:* a decree againſt a farmer has no effect on the landlord, the firſt not being the legitimate *contradictor.*

CONTRADICTORY Propositions, are oppoſites, one of which imports a mere, and naked, denial of the other.

Of theſe, therefore, one muſt be poſitive, and the other negative; as *ſitting,* and *not ſitting: white,* and *not white.* Contradictory propoſitions mutually deſtroy each other.

To have two propoſitions truly contradictory, they muſt be oppoſite, both in quantity and quality, *i. e.* one muſt be univerſal, and the other particular, which make the oppoſition of quantity; and the one affirmative, and the other negative, which make the oppoſition in quality. Thus, *v. gr.* "All uſe of wine and ſilver is evil;" falſe:—"Some uſe of wine and ſilver is not evil;" true. To this it is neceſſary, that the one deny and the other affirm, the ſame thing, of the ſame ſubject, conſidered in the ſame circumſtances: unleſs the queſtion be about an eſſential attribute, in which caſe, no regard is had to circumſtances; every thing having always its own eſſence. This the logicians expreſs by *affirmare & negare idem, de eodem, ſecundum idem.*

There may likewiſe be contradictory propoſitions on a particular ſubject; *e. gr.* an individual. Theſe are called *ſingle* contradictory propoſitions; as "Peter is innocent, Peter is not innocent, or is a criminal." Now to have theſe propoſitions contradictory, Peter muſt be conſidered at the ſame time, without which they may be both true; ſince there may be a time wherein Peter was innocent, and another wherein he was a criminal.

CONTRA-FISSURE. See Counter-*fiſſure.*

CONTRA-HARMONICAL Proportion, that relation of three terms, wherein the difference of the firſt and ſecond is to the difference of the ſecond and third, as the third is to the firſt.

Thus, *e. gr.* 3, 5, and 6, are numbers contra-harmonically proportional; for 2 : 1 :: 6 : 3.

To find a mean contra-harmonically proportional to two given quantities: the rule is, divide the ſum of the two ſquared numbers by the ſum of the roots; the quotient is a *contra-harmonically* mean proportional between the roots.

CONTRA-INDICATION, in *Medicine,* denotes ſuch a ſymptom, or ſet of ſymptoms, as indicate the neceſſity of remedies, which other ſymptoms, or the diſeaſe in general, forbid us to employ.

Thus, when inflammation of the lungs ſupervenes to a low or typhous fever, or *vice verſâ,* the nature of the fever requires cordials and ſtrengtheners for its cure, whilſt the inflammation indicates, on the contrary, the uſe of blood-letting, and other debilitating expedients. Contra-indications are always perplexing occurrences.

CONTRAINT, Fr. reſtrained. This word is ſynonymous with *ſtretto,* in Ital. (which ſee.) It is an adj. which, in *Muſic,* implies, whether in melody or harmony, the *conſtraint* of a theme or ground.

CONTRALTO, *Ital.* the *Counter-tenor.* The compaſs of this kind of voice is uſually very limited; it ſeldom goes lower than G, in the 4th ſpace of the baſe, or higher than C, in the 3d ſpace of the treble. Seneſino had no more than ſix or ſeven good notes in his voice; nor had Guadagni, in his younger days, when he was content with the force of his natural compaſs, which, like Seneſino's, were full, rich, and flexible. This ſpecies of voice is an octave above the baſe; and its clef, that of C on the 3d line, the ſame as the *alto viola,* or *tenor,* among inſtruments.

CONTRAMANDATIO Placiti, in *Law-Books,* ſignifies a reſpiting, or giving the defendant further time to anſwer; or, an imparlance, or countermanding of what was formerly ordered. Leg. H. I. c. 59. See Countermand.

CONTRAMANDATUM, a lawful excuſe, which the defendant, by his attorney, allegeth for himſelf, to ſhew that the plaintiff has no cauſe to complain, *ſi dies placiti ſit contramandatus.* 11 Hen. I. See Countermand.

CONTRAMURE, in *Civil Architecture.* See Countermure.

Contramure, in *Fortification,* is a wall built before another to ſtrengthen it, and to prevent its receiving any damage from the adjoining buildings. See Rampart.

CONTRA-POINTS, in *Muſic.* See Counter-point.

CONTRA-POSITIO, in *Law,* a plea or anſwer. Leg. H. I. c 34.

CONTRA-POSITION, in *Logic.* See Conversion.

CONTRAPPUNTO. See Counter-point.

CONTRARIENTUM Rotulus. See Rotulus.

CONTRARIETY, that which denominates two things contrary to each other.

Contrariety conſiſts in this, that one of the terms imports a negation of the other, either mediately or immediately; ſo that contrariety may be ſaid to be the contraſt, or oppoſition of two things, one of which implies the abſence of the other.

Contrariety, *freedom of.* See Freedom.

CONTRARIES, are poſitive oppoſites; which being of the ſame kind, or ſame common nature, and ſubſiſting by turns in the ſame ſubject, are as remote from each other as poſſible, and mutually expel each other. Such are whiteneſs and blackneſs, cold and heat, &c.

Hence, properly ſpeaking, only qualities can be contraries: *contrariety,* in effect, only agrees to qualities *per ſe;* to other things it agrees *per accidens,* or *in ordine ad qualitatem.*

CONTRARY, however, is often uſed in a more extenſive ſignification, *viz.* for any inconſiſtence or difference between the nature and qualities of things. It is a popular maxim in philoſophy, that *contraria juxta ſe poſita magis eluceſcunt;* contraries ſet off one another. In this ſenſe is the word *contrary* uſed in the ſchools; and hence an argument *à contrario.*

This method of improving things, *è contrario,* is much uſed, and with good ſucceſs, by F. Bourdaloue, in his Sermons.

Contrary, in *Rhetoric.* Contraries are things which, under the ſame genus, are at the utmoſt diſtance from each other: ſo that what we grant to the one, we utterly deny the other; *e. g.* "Virtue ought to be embraced, therefore vice ſhould be avoided." F. de Colonia lays down three kinds of contraries in rhetoric; viz. *adverſatives, privatives,* and *contradictories.*

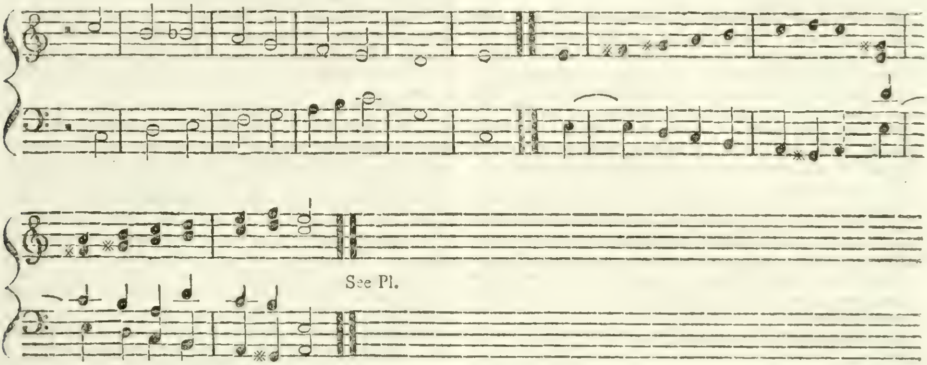
Adverſatives are thoſe that differ much in the ſame thing, as virtue and vice, war and peace: thus Tully, "Si ſtultitiam fugimus, ſapientiam ſequamur; & bonitatem, & malitiam,"

tiam." And Quintilian, "Malorum cauſa bellum eſt, erit emendatio pax." Drances argues thus in Virgil:

"Nulla ſalus bello: pacem te poſcimus omnes."

Privatives are habits, and their privations. *Contradictories* are thoſe, one of which affirms, and the other denies, the ſame thing of the ſame ſubject.

CONTRARY *motion*, in *Muſic*, is when one part aſcends while another deſcends, and *vice verſâ*, oppoſed to *moto retto*, and *moto obliquo*, which ſee.



Contrary motion of the parts, in compoſition, and of the hands in thorough-baſe, has a pleaſing effect, and precludes the ſucceſſion of 5ths and 8ths.

CONTRARY *propoſitions*, in *Logic*, univerſal propoſitions, one of which affirms, and the other denies, the ſame predicate of the ſame ſubject; as "every ſquare is a parallelogram," and "no ſquare is a parallelogram." Theſe propoſitions differ in quality, but not in quantity, and therefore are diſtinguiſhed from contradictory propoſitions, which differ in quantity and quality.

Contrary propoſitions cannot be both true, but may both be falſe: whereas, in contradictory propoſitions, one is neceſſarily true, and the other falſe.

CONTRARY *point of flexure*. See POINT.

CONTRA-SOGGETTO, in *Muſic*, a 2d ſubject in a fugue or canon, or a new ſubject, in contrary motion to the firſt.

CONTRA-TONES, in the *German Muſical Writings*, are ſuch as lie below the great octave of their tablature or literal notation, for the notes of the gamut. All notes on an organ, or other inſtrument which lie, more than two octaves below the tenor cliff note, or , are ſaid to be contra-tones. See TABLATURE.

CONTRAST, in *Muſic*, is often productive of agreeable effects, when, in the ſame movement, we paſs from loud to ſoft, and ſoft to loud; from quick to ſlow, and ſlow to quick; from a ſimple to an elaborate accompaniment, and *e contra*; from low to high, and high to low; and when the harmony is full and thin alternately.

CONTRAST, in *Painting* or *Drawing*. The proper introduction and management of contraſts of lines, forms, colours, lights, and ſhadows, form a very principal, and indeed indiſpenſable, branch of the ſtudy of a painter; and there is perhaps nothing in the art which ſo neceſſarily requires a more than ordinary ſhare of judgment and diſcretion. If contraſts are only ſparingly uſed, they ſeldom fail to produce a ſtriking and happy reſult; if they are too frequent, confuſion in the compoſition, and a ſpotty diſagreeable effect is the conſequence; when they are entirely omitted, inſipidity enſues. Contraſts in painting may, therefore, be compared to diſcords in muſic, which, when ſkilfully introduced, give double reliſh to the harmony, by preventing that nauſea naturally attendant on an uninterrupted ſucceſſion of ſweets of any kind ſoever. The ſubject of contraſts is neceſſarily connected with our inquiries reſpecting the great component parts of painting. We therefore beg to refer the reader to thoſe articles. See INVENTION, COMPOSITION, DESIGN, EXPRESSION, CLAIR-OBSCURE, and COLOURING.

CONTRAST, *to*, in *Architecture*, is to avoid the repetition of the ſame thing, in order to pleaſe by variety; as is done in the great gallery of the Louvre, where the pediments are, alternately, arched and angular.

CONTRAST, or CONTRATE, *wheel*, in *Horology*, denotes that wheel in watches which is next to the crown, whoſe teeth and hoop lie contrary to thoſe of the other wheels; whence its name. See WATCH-*work* and WHEEL.

CONTRAVALLATION, or COUNTERVALLATION, in *Fortification*. See CIRCUMVALLATION.

CONTRAVENTION, a man's failure of performing or diſcharging his word, obligation, or duty, or the laws and cuſtoms of the place. The penalties impoſed in caſes of contravention, only paſs for comminatory.

In a more limited ſenſe, contravention implies the non-execution of an ordinance, or edict.

Contravention is ſuppoſed to be a degree below prevarication; and to be only the effect of negligence or ignorance.

In the French and other ſervices, every commanding officer, of whatever rank, was reſponſible for the wrongs and treſpaſſes committed by the troops under his command. He was obliged to pay the damages; and if himſelf ſet an example of ſuch things, he was conſidered as doubly culpable, and was not only bound to pay the damages, but was otherwiſe puniſhed.

CONTRAYERVA, in *Botany*. See DORSTENIA.

CONTRAYERVA, in the *Materia Medica*, *Dorſtenia Contrayerva*, Linn. This is a perennial plant of South America, the root of which has long been uſed in medicine, and is ſtill retained, though its medicinal powers are but moderate. It is ſaid to have been firſt brought into Europe by ſir Francis Drake, about the year 1581, and from him called *Drakena*.

It was then eſteemed a very great alexiterial, and a ſovereign antidote againſt poiſon.

Its juice is a violent poiſon, ſaid to be uſed by the Peruvians to poiſon their arrows. *Contrayerva* ſignifies *counter-poiſon*, becauſe the root of it is ſaid to be an antidote againſt the poiſon of its juice.

The root is knotty, reddiſh brown externally, and pale within: its taſte is ſub-aſtringent, warm, and ſomewhat bitter; but its acrimony is much ſheathed by the very large quantity of mucilage which it contains. Contrayerva is a gentle ſtimulant. Its uſe is almoſt entirely confined to the pulvis contrayervæ compoſitus, in which it is mixed with crab's claws and chalk. The London Pharmacopeia directs the preparation of it, by mixing 5 ounces, by weight, of powdered contrayerva with $1\frac{1}{2}$ pound of compound powder of crab's claws.

There is another kind of *contrayerva* brought from Virginia, more ordinarily called *ſerpentaria*: this is very aromatic; it is but ſeldom preſcribed ſingly, though ſaid to have the ſame ſucceſs againſt poiſons and venoms with the contrayerva of Peru. This is an excellent ſubſtitute for the contrayerva. See Lewis's Mat. Med. and Newman's Chem. Works.

CONTRE, Fr. in combination with words. See Counter.

Contre-*dance*, Fr. *Country-dance*, taken from the lively and familiar dance of our peaſants and villagers in England. Some, however, imagine that, during the Norman line, we had this rural dance from the French *contre-dance*, in which the partners are placed oppoſite or againſt each other. Of this opinion was the late Mr. Donoyer, dancing-maſter to the royal family.

Contre-*ſens*. The French make uſe of this expreſſion, in *Muſic*, for an abſurdity in compoſition or performance.

Contre-*temps*, *Fr.* is a breach of time, or falſe accentuation. Rouſſeau. But M. Framery (Encycl. Meth.) is not ſatisfied with this definition. According to him, an air is *à contre-temps*, or out of meaſure, when the cloſes are prepared on the accented part of a bar, and made on the unaccented part. The ear expects that the cloſe or final part of an air or movement ſhould be on an accented part of a bar; in common time of four crotchets, on the firſt and third; and in triple time, on the firſt note of a bar. To this we accede, except in Poliſh airs, called *Poloneſi*, or *alla Polacca*, where the cloſe is made on the ſecond note of a bar. See Polonese.

CONTREBIA, in *Ancient Geography*, *Santavert*, a town of Spain, in the country of the Carpetani, eaſt of Complutum. This town, in 571 or 572, was beſieged by the Romans, under the conduct of Q. Flavius Flaccus; and, in conſequence of the delay of ſuccour, ſolicited from the Celtiberians, was obliged to ſurrender. When the Celtiberians afterwards arrived, they were ſurpriſed by the Romans, and totally defeated.

CONTREKI, in *Geography*, a town of Arabia, 180 miles S. of Moſcat.

CONTRES, a ſmall town of France, in the department of Loir and Cher, and chief place of a canton in the diſtrict of Blois. Its population amounts to 1401, and that of the canton to 10,105, perſons, divided among 16 communes, upon a territory of 265 kiliometres in extent. It is ſituated 10 miles S. of Blois.

CONTRI, Antonio, in *Biography*, was the ſon of a lawyer at Ferrara. In his youth he ſpent ſome time in the ſtudy of deſign, which he practiſed many years in the two capitals of Rome and Paris. Upon his return to Italy, he ſettled at Cremona, where he ſtudied the painting of landſcape, under Franceſco Baſſi. His pictures were frequently embelliſhed with flowers: a ſpecies of painting in which he moſt excelled. But his claim to a place in this work reſts principally on a very extraordinary diſcovery which he made, of the method of transferring pictures, painted in freſco on the wall, to canvas, without in the ſmalleſt degree impairing the original beauty of the painting. This he effected by means of a ſtrong cement, or roſin, which he ſpread over a cloth, the ſame ſize as the picture he was deſirous of removing. This was then firmly applied to the face of the freſco. A pannel of the ſame ſize was then faſtened to the back of the cloth, when the plaſter or freſco was cut round to the ſize of the cloth. After ſome days, the board with the cloth was removed from the wall, drawing with it the painting. Another cloth, prepared with a cement ſtill ſtronger than the firſt, was then applied to the back of the picture; after which the former cloth was removed, leaving the picture in its original ſtate of perfection. He ſucceeded in many experiments of this kind in Cremona, Ferrara, and Mantua. This ſecret, however, has been ſeldom divulged; and the late pope, Pius VI., for many years, gave a conſiderable penſion to the only perſon who was acquainted with it at Rome, upon the condition of his removing no freſco paintings from the Eccleſiaſtical State without his permiſſion: wiſely judging, that though the temples and palaces of Italy might be deſpoiled of oil pictures, the freſcos of the great maſters would at all times furniſh ſufficient example for ſtudents, and ample gratification to the curious traveller. Antonio Contri died in 1732, leaving a ſon named Franceſco, who followed the footſteps of his father. Lanzi, Storia Pittorica.

CONTRIBUTA, in *Ancient Geography*, *Medina de las Torres*, a town of Spain, in the eaſtern part of Betica; called alſo "Julia Contributa."

CONTRIBUTION, the payment of each perſon's quota, or the part he is to bear in ſome impoſition, or common expence.

Contributions are either *involuntary*, as thoſe of taxes and impoſts; or *voluntary*, as thoſe of expences for carrying on ſome undertaking for the intereſt of the community.

When goods are caſt into the ſea, for the ſafe-guard of a ſhip, or other goods, &c. aboard, in a tempeſt, there is a contribution among merchants, towards the loſs of the owners. (See Insurance.) And where a robbery is committed on the highway, and damages are recovered againſt one or a few perſons, in an action againſt the hundred, the reſt of the inhabitants ſhall make contribution to the ſame. 27 Eliz. c. 13. See Robbery.

Contributions, *Military*, denote impoſitions, duties, or taxes, which places and ſometimes frontier countries pay to redeem themſelves or purchaſe exemption from being pillaged, plundered, and inſulted by the enemy.

It would coſt a prince often too much to make war entirely at his own expence. If he adopt juſt meaſures according to his finances not to run ſhort of money, he takes them alſo with his general for finding the means of augmenting or at leaſt ſparing his funds. Theſe means are contributions, which are of two kinds, *viz.* thoſe which are exacted in ſubſiſtence and commodities, and thoſe which are received in money.

Thoſe that are paid in commodities, or ſubſiſtence, are different ſorts of grain, forage and proviſions, carriage for things wanted as well by water as by land, wood of every ſpecies, pioneers, and a particular treatment or entertainment of troops in their winter-quarters and lodgings.

No levy ought to be made or taxes raiſed till a juſt ſtatement is procured of the ſituation of the country intended to be laid under contribution, that the impoſition may be rendered as equitable and little burthenſome as poſſible. No demand, for example, is made of wood on thoſe places that have only grain or meadows, or of land-carriages on thoſe who make uſe of water-carriage.

The levy of different ſorts of grain is made on thoſe tracts or diſtricts of country, that have quietly and peaceably reaped their harveſt, and as it were by way of gratitude or acknowledgment for the tranquillity they have enjoyed, through the good behaviour and diſcipline of the army.

That of oats and other grain for horſes ſhould be made under the colour or pretext of regularity or good order, by which means a country is infinitely leſs burthened than it would be, were it abandoned to the avidity of horſemen, who would carry off the grain, whereſoever they might find it, either in a regular or irregular manner, or with orders or without orders.

That of forage ſhould be made in the ſame manner, and a convenient time ſhould be fixed on for the carriages that are to carry it to the places, where it is reſolved it ſhall be conſumed and made uſe of.

That of proviſions is uſually made, if it be poſſible, in thoſe diſtricts of country, where the troops cannot winter, to prevent the occaſioning of a ſcarcity in that where they are to take up their winter-quarters.

Carriage, whether by land or by water, is neceſſary for filling the magazines made in the rear of the armies with ammunition and proviſions; or for the taking of heavy artillery and ammunition to a place beſieged; or for the removing of ſick and wounded; or for the tranſport of materials deſtined for works.

Impoſitions of wood are made for paliſades, for the conſtruction of caſernes and ſtables, &c. and for fuel to the troops in winter.

Pioneers are aſſembled or collected together to fortify poſts deſtined for wintering the troops in; for throwing up with promptitude and expedition lines of circumvallation round a place beſieged; for repairing roads and opening defiles; for the conſtruction of lines made with a deſign to cover a country and thereby exempt it from *contributions*; and for levelling and filling the works made before a place after it is taken.

Utenſils and neceſſaries for the troops taken in an enemy's country are raiſed or obtained in two ways. The places, where they winter, ſhould not furniſh more of them than the conveniencies which the ſoldier finds in the houſe of his landlord, ſuppoſing there are no barracks in theſe places. But if there are barracks, the contribution in money is compenſated by theſe commodities, and ought to be leſs than that which is raiſed on a level country or in towns, where there are no troops lodged.

The contribution in money is extended as far as poſſible. It is eſtabliſhed in two ways; voluntarily over tracts of country within reach of poſts and places deſtined for winter-quarters; or by force, whether by the army itſelf whilſt it is advancing, or by large parties that are detached for penetrating into thoſe parts which you wiſh to lay under contribution.

It is made alſo behind the places belonging to the enemy and rivers by means of terror, whether by incendiaries diſguiſed, who ſpread and diſſeminate billets, or by different ways, in which ſmall parties are made to paſs the rivers, who endeavour to carry off ſome perſons of conſideration in the country, or to burn ſome large habitation, or dwelling place, or building.

A prince in ſhort ought to have an exact account kept of all contributions, and have thoſe particularly looked after, who are employed in raiſing and collecting them, ſince it is but too common for them to make an improper uſe of what they raiſe or collect for their own perſonal advantage. And when the contributions are not judiciouſly aſſeſſed and demanded, the particular intereſt of thoſe who impoſe them, or receive them, always prevails over the intereſt of the prince or ſovereign.

It is a great relief and eaſement in contributions, when they are impoſed with juſtice, equality, and in an exact proportion to the abilities of thoſe on whom they are raiſed; and when they are collected without inſolence, without ſeverity or oppreſſion, and without being converted to the profit or benefit of individuals; and when, in default of money, other goods and commodities are taken, as cloths, proviſions, &c. but moſt of all when an army quits its own country to make war in that of the enemy or any other, whatever it may be.

Frederic II., or the Great, in ſpeaking of the conduct of an officer ſent out to levy contributions, expreſſes his ſentiments in the following words: "Contributions are generally levied under one of the following circumſtances; either being ſuperior to the enemy you cover the whole country; or you poſſeſs a part of it till the arrival of the enemy; or you are interrupted by their light troops.

"In the firſt caſe it is common for the commander in chief to fix the ſum to be raiſed by the inhabitants, under pain of military execution. Upon this duty the officer muſt vigorouſly exert his utmoſt authority to make his huſſars obſerve the ſtricteſt diſcipline and decorum, leſt the inhabitants ſhould be ruined beyond recovery.

"The ſecond caſe requires great circumſpection in the officer, and a perfect knowledge of the country, that he may not be ſurpriſed by the unexpected arrival of the enemy; he muſt pre-determine his plan of retreat, and fix the place of general depoſit; and for his farther ſecurity he muſt advance ſmall detachments towards the enemy, that he may have early notice of their approach, and ſo interrupt all communication with the inhabitants.

"On his firſt arrival in the country, he will diſpatch circulating billets of delivery, the duplicates of which are to be carried by the parties which are ſent to levy the contributions. Theſe parties are to have orders to return at a certain time, beſides which they are to have ſealed inſtructions indicating the places of ſecond and third rendezvous, but theſe orders are not to be opened unleſs in caſes of neceſſity.

"When contributions are to be raiſed in this manner, with the enemy at your heels, all lenity is out of the queſtion. Where there is no coin to be had you muſt take any thing, that may be eaſily tranſported, or cattle, or hoſtages; but theſe only as your laſt reſource. If you are cloſe preſſed by the enemy, it is beſt to divide your booty and ſend it different roads, that you may ſave at leaſt ſome part of it.

"In the third caſe, namely, when the enemy hinders the inhabitants from delivering their quota, the peaſants are in great danger of total ruin. Nevertheleſs, as the exigencies of the army require it, you are to proceed with all poſſible rigour, and even to puniſh thoſe who neglect to deliver their proportion at the time required, that the reſt through fear may be more punctual in obeying the orders they have received."

CONTRIBUTIONE Facienda, in *Law*, a writ which lies where ſeveral perſons are jointly bound to the ſame thing, and one or more of them refuſe to contribute their ſhare.

If tenants in common, or joint, hold a mill *pro indiviſo*, and equally ſhare the profits of the ſame; the mill falling to decay, and one or more of them refuſing to contribute to its reparation, the reſt ſhall have the writ *de contributione facienda* to compel them. And if there be three coparceners of land that owe ſuit to the lord's court, and the eldeſt performs the whole; then may ſhe have this writ to compel the refuſers to a contribution. So when one ſuit is required for land, and that land being ſold to divers perſons, ſuit is demanded of them all, or ſome of them by diſtreſs, as entirely as if all the land were ſtill in one. Reg. Orig. 175. F. N. B. 102.

CONTRITION, in *Theology*, expreſſes a real ſorrow, reſulting from the thought of having offended God; from the ſole conſideration of his goodneſs; without any regard, or, at leaſt, independently of any reſpect, to the puniſhment annexed to the ſin; accompanied with a deteſtation of ſin, and of ourſelves on account of it. With this act of the mind, it is ſaid, that repentance, properly ſpeaking, begins.

Some of the Romiſh doctors avow, notwithſtanding the practice of their church, that contrition is valid, and carries with it every thing neceſſary to obtain pardon, without the ceremony, or as they call it, the *ſacrament* of confeſſion and abſolution.

And in this they make the difference between contrition and Attrition (which ſee) to conſiſt. This doctrine was maintained by F. Seguenot upon St. Auguſtine; but it was cenſured by the faculty of Paris.

CONTROL. See Comptrol.

CONTROLLER. See Comptroller.

CONTROLES, Fr. the ſame as Muster-rolls, or Registry-books; which ſee.

CONTROLEUR *General d'Artillerie*, controller general of artillery. This appointment was of an old ſtanding in France, and was next to that of grand maſter or maſter general of artillery, except that of *garde general d'artillerie*. It was however ſuppreſſed, and in 1703 Louis XIV. created two offices in lieu of it, *viz.* that of directors general of artillery, and that of commiſſary general of powder and ſalt-petre. But by his declaration of the 21ſt July 1716, he ſuppreſſed theſe offices, and ſeveral others, and attached to that of controller general all the ancient functions, which that officer afterwards exerciſed in their full extent, and which had been eſtabliſhed by the edicts and declarations of Francis I. and his ſucceſſors.

It is an office of great military importance, and much reſponſibility. He has a number of commiſſaries paid by the ſtate to act and manage under him, by his orders, and in his name. They aſſiſt at the various proofs of powder and pieces of ordnance, and can take and demand an account of the purchaſes made in their abſence by the principal officer of artillery.

Controleurs *Provinciaux d'Artillerie*, provincial controllers of artillery. Theſe officers in France uſed to control all the expences and purchaſes in general, of whatever kind they might be, that concerned the artillery, and could refuſe or reject the arms, ammunition, and in ſhort every thing that proved defective, on the deliveries of articles purchaſed or contracted for. They have each of them a key of the magazines where they reſide. And upon entering on the exerciſe of their office, they cauſed inventories to be given to them by the *gardes-magazins* of every article in them, of which they made a regiſter, and on it added the receipts, returns, and expenditures of ſtores, that they might be always able to render an account to the controller general, and the commandants of artillery. They often made their viſits, and chiefly at the ſame time that the commandants of artillery made theirs. They gave certificates of the dead and wounded, and made an inventory and ſale of the effects of the dead, with the concurrence of the commiſſaries, or the *major des equipage*.

Controleur *General de depenſes de l'Artillerie*, controller general of the expences of the artillery. Theſe officers kept regiſters or accounts of the receipt and expenditure in money which was made by the treaſurer general of artillery, as well as of the receipt and expenditure of pieces of ordnance, ammunition, and of purchaſes.

Controleurs *des Guerres*, war-controllers. The functions of a *controleur des guerres* are to keep a regiſter and control of the muſters and reviews of troops. See the article Muster-masters.

Controleurs *d'Artillerie*, controllers of artillery. See the article Controleurs *Provinciaux d'Artillerie*.

Controleur *General des Vivres*, controller general of proviſions. The undertakers uſed to chooſe for this employment an old commiſſary who was perfectly acquainted with the buſineſs, and was a perſon deſerving of confidence. He had a very extenſive commiſſion for inſpecting and taking cognizance of every thing that concerned proviſions; and the exerciſe of his duty was conſidered as conſiſting of two parts; namely, that he ſhould in the firſt place make himſelf properly acquainted with the ſtate of the magazines that were to ſupply the army, and in the ſecond place accompany the director general of proviſions, to whom he was ſubordinate when he ſhould take the field.

The firſt thing which the controller-general of proviſions uſed to do, was to make a liſt or ſtatement of all the places that depended on him, and of the commiſſaries who did duty there. He inquired what were their functions, into their character for zeal and ſpirit, the extent of their genius, their capacity, what offices they had been employed in, what families they were of, or had, the places of their birth, their age, and their manners.

He examined if the regiſters of the magazines were in proper form, both as to receipts and expenditures, and expences; as to the receipts, if the quantity in them is well ſpecified, the quality, the different names of the meaſures, the weights of the country reduced to avoirdupoiſe weight, in caſe it ſhould be different; if the name of the ſeller, the place of his abode, and the date of the purchaſe, are ſet forth in the article.

As to the expence, he examined what ſupplies the commiſſary had ſent to the magazines, or procured, the nature of the grain and flour, the quantities, and the copies of letters of carriage of the articles ſent. After taking an extract of the receipts and expences, he ſaw what remained in the magazine, he himſelf counted the ſacks, and made a certified ſtate of the whole to be given to him.

The duties of this office, in ſhort, were ſo many and troubleſome, that if this officer, who, we have already obſerved, was ſubordinate to the director general of proviſions, literally fulfilled them, he could not have had ſo much as one day of reſt or repoſe during the whole continuance of a campaign. See Commissary-general *of Stores*.

Controleur *des Hoſpitaux Militaires*, controller of military hoſpitals. Whenever a ſick or wounded perſon enters an hoſpital, this officer writes upon a regiſter endorſed and marked by a commiſſary of war, the military appellation or deſignation of the perſon ſick or wounded, the name of his family, the place of his nativity, and the city neareſt to that place. He makes alſo two ſtatements of his money and his effects, one of which ſerves as an *etiquette au paquet*, or ticket to the parcel or packet, and the other is returned to the ſick or wounded man, in caſe of whoſe death an account is rendered to the major of the regiment to which he belonged.

For the moſt part, however, the undertakers are the heirs or inheritors, for after a year and a day no part of either can be demanded from them.

This officer ſigned the billets of ſoldiers when they entered an hoſpital, and made them report themſelves to him when they went out. He obliged the overſeers of infirmaries to render him an account of the dead immediately after their deceaſe, that he might take them off from his regiſter. In hoſpitals where there was no controller, every thing now mentioned was executed by the director.

CONTROVER, in *Law*, a perſon who of his own head deviſes or invents falſe or feigned news. 2 Inſt. 227.

CONTROVERSIAL Divinity. See Polemical *divinity*.

CONTROVERSY, or Cause, *State of a*, among *Ancient Rhetoricians*, denotes the principal point in diſpute between contending parties, upon the proof of which the whole cauſe or controverſy depends. Ancient writers have expreſſed it by ſeveral other names, as "the conſtitution of the cauſe," "the general head," and "the chief queſtion." (Quint. Inſt. Orat. l. iii. c. 6.) As this is the principal thing to every controverſial diſcourſe, it alſo requires the primary conſideration of the ſpeaker, and ſhould be well fixed and digeſted in his mind, before he proceeds to inveſtigate arguments for its ſupport. See Antony's account of his own method of pleading, in Cic. de Orat. l. ii. c. 27. Quintilian (Inſt. Orat. l. iii. c. 6.) deſcribes the ſubject of this article to be "that kind of queſtion which ariſes from the firſt conflict of cauſes." In judicial caſes, it immediately ſucceeds the charge of the plaintiff, and plea of the defendant. Our common law expreſſes it by one word, *viz.* the Issue: which ſee. This interpreters explain by deſcribing it to be "that point of matter depending in ſuit, upon which the parties join, and put their cauſe to the trial." Thus, in the cauſe of Milo, the charge of the Clodian party is, "Milo killed Clodius." Milo's plea or defence is, "I killed him, but juſtly." Hence ariſes the grand queſtion, or "ſtate of the cauſe;" "whether it was lawful for Milo to kill Clodius?" That Clodius was lawfully killed by Milo is what Cicero, in his admirable oration, in defence of Milo, principally endeavours to prove. The whole of his diſcourſe is to be conſidered as centering at laſt in this point. Again, in the caſe of Roſcius, the charge made againſt him is "that he killed his father." But he denies the fact. The grand queſtion therefore to be argued is; "whether or not he killed his father?" Cicero's deſign in his defence of him is to ſhew, that his accuſers had not made good their charge.

Beſides the principal queſtion, there are ſubordinate queſtions that occur in the courſe of a diſpute, which ſhould be carefully diſtinguiſhed from it: and more particularly that, which ariſes from the reaſon or argument alleged in proof of the principal queſtion. Thus, in the cauſe of Milo, his argument is, "I killed Clodius juſtly, becauſe he aſſaſſinated me." Unleſs the Clodian party be ſuppoſed to deny this, they give up their cauſe. Hence therefore a ſubordinate queſtion ariſes; "whether Clodius aſſaſſinated Milo?" Cicero ſpends much time in the proof of this, as the hinge, on which the firſt queſtion, and conſequently the whole cauſe depended. But whatever may be the number of ſubordinate queſtions, they are all dependent upon the firſt; and though each of them has its particular ſtate, yet neither of theſe is what the rhetoricians call "the State of the Cauſe," which is to be underſtood only of the principal queſtion. Beſides theſe ſubordinate queſtions, incidental ones are often introduced, having ſome reference to the principal queſtion and contributing towards the proof of it, though they are not neceſſarily connected with it, or dependent upon it. Each of theſe has its "ſtate," though different from that of the "cauſe." Many queſtions of this ſort occur in Cicero's defence of Milo, occaſioned by aſperſions that had been thrown out by the Clodian party to the prejudice of Milo. To each of theſe Cicero replies, before he proceeds to the principal queſtion. And therefore, though the queſtion, in which the "ſtate of a Controverſy" conſiſts, is ſaid by Quintilian to ariſe from the "firſt conflict of cauſes," yet we find from the inſtance of Cicero, now adduced, that it is not always the firſt queſtion in order, upon which the orator treats. It ſometimes happens, that the ſame cauſe or controverſy comprehends more than one ſtate. Thus in judicial cauſes, every diſtinct charge occaſions a new ſtate. All Cicero's orations againſt Verres relate to one cauſe, founded upon a law of the Romans againſt unjuſt exactions, made by the governors of provinces upon the inhabitants; but as that proſecution is made up of as many charges, as there are orations, every charge, or indictment, has its different ſtate. It may be obſerved, that diſcourſes of a deliberative and demonſtrative kind, as well as judicial, are managed in a controverſial way; and all controverſies have their "ſtate." And therefore Quintilian very juſtly obſerves (Inſt. Orat. l. iii. c. 6.) that "ſtates belong both to general and particular queſtions; and to all ſorts of cauſes demonſtrative, deliberative, and judicial." As to the number of theſe "ſtates," Cicero and Quintilian reduce them to three. "Three things," ſays the latter (Inſt. Orat. l. iii. c. 6.) "may be inquired into in all diſputes; whether a thing is, what it is, and how it is. And this is the method which nature preſcribes. For, in the firſt place, it is neceſſary the thing ſhould exiſt, about which the diſpute is; becauſe no judgment can be made either of its nature or quality, till its exiſtence be manifeſt; which is therefore the firſt queſtion. But though it be manifeſt, that a thing is, it does not frequently appear what it is; and when this is known the quality yet remains; and after theſe three are ſettled, no further inquiry is neceſſary." The firſt of theſe three ſtates is called the *conjectural* ſtate; the ſecond is called the *definitive* ſtate; and the third is called the ſtate of *quality*. The firſt occurs when it is inquired, "whether one perſon killed another?" The ſecond appears in an example of Cicero; "whether to take a ſacred thing out of a private houſe be theft, or ſacrilege?" The third is manifeſt, when the contending parties are agreed both as to the fact, and the nature of it; but the diſpute is, "whether it be juſt or unjuſt, profitable or unprofitable, and the like?" as in the cauſe of Milo. Ariſtotle (De Rhet. l. iii. c. 26.) and from him Voſſius (Inſt. Orat. l. i. c. 6. § 7.) add a fourth ſtate, namely that of *quantity*; *e.g.* "Whether an injury be ſo great as it is ſaid to be?" Quintilian, however, thinks (ubi ſupra) that this may be referred to one or other of the preceding ſtates; ſince it depends upon the circumſtances of the fact, as the intention, time, place, or the like. The importance and uſe of the preceding obſervations require little illuſtration. Whenever a perſon engages in a controverſy, he ought in the firſt place to conſider the main queſtion in diſpute, to fix it well in his mind, and to keep it conſtantly in his view: and it is equally neceſſary for his hearers duly to regard this point, as they will thus be enabled to diſtinguiſh and ſeparate from the principal queſtion what is only incidental, and to obſerve how far the principal queſtion is affected by it; to perceive what is offered by way of proof, and of illuſtration; not to be miſled by digreſſions, but to diſcern when the ſpeaker deviates from his ſubject and when he reſumes it; and ſo to accompany him through the whole diſcourſe and through his whole chain of reaſoning, as to be able to judge, upon the whole, how far his concluſion is fairly drawn from his aſſumed premiſes. A conſtant regard to the ſtate of the cauſe, and principal point in diſpute, is very neceſſary for this purpoſe. Although rhetoricians treat of theſe ſtates only as they relate to controverſies, and become the ſubject-matter of diſpute between differing parties; yet every diſcourſe has one or more principal heads which the ſpeaker chiefly propoſes to prove or illuſtrate. Ward's Orat. vol. i. lect. vi.

CONTUBERNALES Magistratuum, companions of the magiſtrates. Theſe were young men deſtined for civil and military employments, whom the magiſtrates, in the time of ancient Rome, took into their department to be formed under their eyes and in their houſes.

The ſame appellation of *contubernales* was alſo given to ten ſoldiers, who lived in one and the ſame room or under one and the ſame tent.

CONTUBERNIUM, in *Antiquity*, denotes a ſort of connection or cohabitation that took place between male and female ſlaves in the middle ages. Although their maſters or proprietors did not permit them to marry, they were allowed to form this kind of union. This practice ſo much prevailed, that during ſeveral centuries after the barbarous nations embraced Chriſtianity, ſlaves, who lived as huſband and wife, were not joined together by any religious ceremony, and did not receive the nuptial benediction from a prieſt; when this conjunction between ſlaves came to be conſidered as a lawful marriage, they were not permitted to marry without the conſent of their maſter, and ſuch as ventured to do it without obtaining that, were puniſhed with great ſeverity, and ſometimes were put to death.

CONTUCCI, Andrea, in *Biography*, likewiſe called Andrea Sanſovino, from a town in the Tuſcan dominions, which gave him birth in the year 1460. Like Giotto he was the ſon of a ſimple ſhepherd, and, like him, his genius for deſign diſcovered itſelf in childhood, by the drawings which he made in the ſand, and the models which he amuſed himſelf with forming out of clay. Theſe youthful productions were ſeen and admired by Simone Veſpucci, then chief magiſtrate of the town of Sanſovino: he perceived in them the prognoſtics of the future fame of our young artiſt, and obtained the permiſſion of his father to carry him to Florence, where, under the tuition of Antonio Pollajuolo, he made a rapid progreſs, and ultimately became one of the moſt celebrated architects and ſculptors of his age. The chapel of the ſacrament, in the church of Santo Spirito at Florence, although ſmall, is a beautiful ſpecimen of the perfection which he attained in the former art, and is ſo finely put together that it appears as if chiſelled out of one ſtone. By this, and other works, he ſoon acquired an extended reputation; inſomuch, that he was invited into Portugal, where he erected many edifices, and amongſt others a palace with four towers for the king. After nine years reſidence in that country, he returned, loaded with preſents, to Italy, and was employed by Leo X. in many conſiderable works; eſpecially in the ſtatues and baſſo-relievos which ornament the Santa Caſa of Loretto. Several of his other productions in ſculpture are at Rome, particularly two ſepulchres within the choir of the Madonna del Popolo, and a fine group repreſenting St. Anne, Chriſt, and the Madonna, in the church of St. Agoſtino. He died much regretted in the year 1529, at the place of his nativity. Milizia, Mem. degli Architetti.

CONTUMACY, in *Law*, a refuſal to appear in court when legally ſummoned; a diſobedience to the rules and orders of a court having power to puniſh ſuch offence.

The word is uſed in civil as well as in criminal matters; but more rarely in the firſt, wherein the words *default*, and *contempt*, ordinarily ſupply its place: the refunding of the charges of contempt, judged at the hearing, is alſo the penalty of contumacy. In a criminal ſenſe, the contumacious is condemned, not becauſe the crime is proved on him, but becauſe he is abſent.

By the Roman laws, there was no proceſs in caſe of contumacy, during the firſt year of abſence: they only took an inventory of the goods of the fugitive, and if he died in the year, he died *integri ſtatus*; but, after the year was expired, he was deemed culpable.

In England, contumacy is to be proſecuted to outlawry. In France, all contumacies are annulled, if the accuſed make his appearance in five years: if he die in that time, his relations are allowed to purge his memory.

CONTUS, κοντος, in *Antiquity*, a long ſpear, chiefly uſed by the horſe.

CONTUSION, in *Surgery*, a bruiſe, from the Latin *contuſio*. This term is applied to that kind of leſion which is occaſioned by the application of a blunt ſubſtance to the ſurface of the body, with more or leſs violence, but without dividing the ſkin; it is alſo uſed, when any part has been pinched, compreſſed, or [illegible]. The firſt effects of a contuſion are a laceration of [illegible] or [illegible] in the bruiſed part; and its common ſymptoms are ſwelling and inflammation. A violent contuſion occaſions conſiderable lacerations; amongſt the many ſymptoms of which, effuſion of fluids into the neighbouring cellular texture, and even fractures of the bones, are the moſt frequent. (See Ecchymosis and *Contuſed* Wound.) A violent contuſion operates not only upon the part at which it immediately takes place, but alſo upon remote parts of the body; and the leſions thus produced are termed counter-injuries. See Counter-fissure.

The degree of the contuſion does not always depend upon the force which has occaſioned it, but alſo often upon the nature of the parts that have been bruiſed. The contuſion is always violent, when there is a bone in the injured part, which is little covered with fleſhy ſubſtance. In every ſuch caſe of contuſion, inflammation, with all its bad conſequences, is to be apprehended. In healthy perſons, violent contuſions often produce as ſerious conſequences; but in perſons whoſe ſolids are previouſly debilitated, ſlight contuſions frequently produce gangrene and ulceration. Extravaſated fluids, even though in large quantity, are diſcuſſed and reabſorbed, eſpecially when they are ſituated in parts of a looſe ſpongy texture, or where there are many abſorbent veſſels. In the more ſolid parts, for example, in tendinous and aponeurotic parts, ſmall effuſions cannot be diſcuſſed, and when ſituated near to bones, they eaſily give riſe to caries by their preſſure.

With regard to the cure, contuſions frequently occaſion more trouble to the ſurgeon than fractures; according as the operation and counter-operation of the force applied has been more or leſs violent, and alſo according as the patient does or does not give the injured part the requiſite repoſe, which is equally neceſſary in caſes of contuſion as it is in fractures. The ſlighter degrees of contuſion require nothing more than the uſe of external diſcutient and aſtringent remedies; the beſt of which are cold water, wine, brandy, vinegar, and ſolutions of ſal ammoniac, or of alum, or decoction of Peruvian bark, &c. The weakened and ſtretched parts (if there be not much pain or inflammation) may alſo be ſupported by the preſſure of a tight bandage; and when the contuſion is of conſiderable extent, by bandaging the whole limb. When the patient is plethoric, and the bruiſed part is of importance, a vein muſt be opened, or leeches applied to it.

In the more violent degrees of contuſion, the patients require evacuations, eſpecially cooling purgatives frequently repeated. External preſſure and friction, when the extravaſation is conſiderable, will greatly aid its abſorption, and is therefore beneficial. The more important is the bruiſed part, and the more copious the extravaſation, the more aſſiduouſly muſt all theſe remedies be employed; but in leſs extenſive contuſions, the external applications may be ſufficient.

However, the cold fomentations and ſpirituous aſtringents muſt not be applied without proper ſelection. A decoction of diſcutient herbs in wine, or in a mixture of equal parts of wine and water, eſpecially when aponeurotic and tendinous parts have been much injured, produces often the greateſt benefit; and to this may be added alſo ſal ammoniac, when the pain and tenſion have abated. But if the ſkin be abraded, theſe ſaline applications cannot well be employed.

Sometimes the pain increaſes, in ſpite of theſe applications, to ſuch a degree, that emollient cataplaſms and oleaginous frictions become neceſſary: the following method is particularly recommended in ſuch caſes. Rub well the whole bruiſed part, above and below the contuſion, eſpecially below it, with good oil, and then cover the whole with a mixture of olive oil and ſtrong wine-vinegar, formed into a kind of liniment by agitation. This mixture may beſt be applied upon thick lint, wrapped round the whole part; thus, when the ancle has ſuffered the contuſion, a part of the leg and foot muſt be covered with it. Theſe dreſſings are to be renewed twice or thrice a day, till the ſwelling and pain diſappear. The whole part muſt then be frequently rubbed with camphorated ſpirit of wine. When this has been done for about three or four days, a cloth may be applied, ſpread with a thick ointment compoſed of white of egg mixed with crude alum. This may be repeated about three times, with intervals of 12 hours.

The yellow or blue ſpots that remain after the cure of contuſions, may eaſily be made to diſappear, by applying to them a mixture of bran, ſalt, and vinegar, boiled together till the bran has imbibed the fluids.

When the quantity of extravaſated blood is very large, or when it is ſituated in a part where it cannot eaſily be abſorbed, or when it gives riſe to ſymptoms which demand ſpeedy relief, it muſt be immediately evacuated by an inciſion, and the ſore treated like a wound combined with contuſion. The ſame practice muſt alſo be obſerved, when the internal hæmorrhage by which the extravaſation is produced, proceeds from a large veſſel, continues, and requires to be ſtopped by ſome particular applications; or when, beſides the extravaſation, other leſions of the parts are alſo preſent, as, for example, when the bone has been ſhattered. Should there ſtill remain lumps of coagulated blood behind, after the uſe of the diſcutient remedies, theſe muſt alſo be removed by inciſions, if they threaten to produce further miſchief by their preſſure.

Blows and contuſions of the *joints* deſerve particular attention: for in theſe ſituations, eſpecially in the knee joint, they are always dangerous. The conſequences are violent pain and impeded motion; the pain is generally ſevere at firſt, but ſometimes not. In the firſt caſe the ligaments, and in the ſecond the glands, or interior parts, of the joint have been principally affected. In the latter caſe the conſequences are dropſy, or even ſuppuration of the joint, which frequently proves fatal. When the ligaments or other external parts of the joint have been injured, the part muſt be kept quiet, and treated, according to the peculiar circumſtances of the caſe, with the remedies formerly mentioned, but eſpecially we ſhould have recourſe to leeches: it may afterwards be waſhed with ſpirituous and ſaline applications. When the pain has ceaſed, and there remains behind, as often happens, a ſtiffneſs in the part, the ſoap, liniment, and vapour bath may be employed with advantage. Should arthritic affections be ſuperadded, ſpeedy relief muſt be procured, and the dangerous conſequences obviated by cupping, bliſters, friction with flannel, and the internal uſe of camphorated remedies. When the ligaments have been ſtretched and relaxed by a fall, the German ſurgeons apply, with good effect, ſmall bags filled with the warm powder of plaiſter of Paris, mixed with a fourth part of ſal ammoniac and common ſalt.

When the glands, or internal parts of the joint, have been injured, the ſurgeon ought not to intermit the application of appropriate remedies, till the pain has entirely ceaſed; eſpecially repoſe, blood-letting, and cold fomentations. The leſion of a joint, particularly of the knee, by a fall, blow, &c. eaſily gives riſe to a white ſwelling of the part. In ſuch caſes the ſurgeon cannot employ too great care and attention, as the ſymptoms are ſo numerous and diverſified, that it is in vain to expect a fortunate reſult from a careleſs and inert practice.

Internal contuſions are attended, more or leſs, with diſtreſſing and ſerious ſymptoms. If the head be violently contuſed, there is danger leſt the brain ſhould have ſuffered at the ſame time; or leſt the effuſed blood, lying long upon the cranium, ſhould injure the bone by its preſſure, if it be not ſpeedily abſorbed.

When the thorax has been violently contuſed, the heart, lungs, and large blood-veſſels within the cheſt, are liable to partake of the injury; or a rib may be fractured, and may pierce the lungs, ſo as to occaſion alarming conſequences, if not death itſelf.

A general contuſion of the abdomen, or a blow received upon it, may perhaps hurt the liver, ſtomach, uterus, bowels, &c. or may rupture an important blood-veſſel, and thus cauſe the death of the patient by the internal bleeding, inflammation, or ſuppuration.

The judicious ſurgeon will therefore, in ſuch caſes, conſider what internal parts are likely to have ſuſtained an injury, and will adapt his means to the peculiar circumſtances which ariſe. See CONCUSSION, FRACTURE, and HÆMORRHAGE.

CONTWIG, in *Geography*, a ſmall town of France, in the department of Mont Tonnerre, and chief place of a canton in the diſtrict of Deux Ponts, with 780 inhabitants. The canton itſelf is compoſed of 16 communes, and reckons 4114 inhabitants.

CONTY, a ſmall town of France, on the river Seille, in the department of Somme, 12 miles S.E. of Amiens, which formerly gave the title of prince to the ſecond line of the houſe of Bourbon Condé. It has only 759 inhabitants, but is the chief place of a canton, which, in 27 communes, and upon a territorial extent of 220 kiliometres, reckons 9675 perſons, and forms part of the diſtrict of Amiens; 3½ leagues N.N.E. of it.

CONTZ, a ſmall town of France, in the department of Sarre, and chief place of a canton in the diſtrict of Treves. The number of its inhabitants does not exceed 351, and the whole canton has 31 communes, and a population of 4972 individuals.

CONTZEN, ADAM, in *Biography*, a Jeſuit, and native of the duchy of St. Juliers, has been celebrated for his deep knowledge in the learned languages which he taught in the college of Munich, where he died in the year 1635, after having publiſhed "Commentarii in Evangelia in Epiſt. Pauli ad Rom. et ad Corinth." 2 tom. folio. He wrote likewiſe ſome able pieces in defence of the Catholic religion as oppoſed to the Proteſtants. Moreri. Nouv. Hiſt. Dict.

CONVALESCENCE, in *Medicine*, the inſenſible recovery of health; or that ſtate in which, after the cure of a diſorder, the body which has been reduced, has not yet regained its vigour, but begins to reſume its powers. Proper aliments conduce to the re-eſtabliſhment of the languid faculties; but as the tone of the bowels is weakened, the digeſtive faculty is not equal to its office, which is ſhewn by light ſweats over the whole body; and the ſmalleſt exceſs in this reſpect is oftentimes the occaſion of dangerous relapſes. A perſon in this ſtate is like a taper relumined, which the leaſt degree of wind is ſufficient to extinguiſh. Encycl.

CONVALESCENT, recovering or returning to a ſtate of health. In this country hoſpitals are eſtabliſhed in different diſtricts, for the preſervation and recovery of our troops when ill or indiſpoſed. Among others, there is in each diſtrict a convaleſcent hoſpital.

Liſt of convaleſcents, is the return made out by the ſurgeon belonging to a battalion, hoſpital, &c. in order to aſcertain the ſpecific number that may ſoon be expected to be able to do duty.

CONVALLARIA, in *Botany*. Linn. Gen. 425. Schreb. 575. Willd. 649. Gært. 67. Juſſ. 42. Vent. 2. 145. Muguet. Encyc. Claſs and order, *hexandria monogynia*. Nat. Ord. *Sarmentaceæ*, Linn. *Aſparagi*, Juſſ. *Aſparagoides*, Vent.

Gen. Ch. *Cal.* none. *Cor.* monopetalous, bell, funnel, or wheel-ſhaped, ſmooth, more or leſs deeply ſix-cleft; ſegments open or reflexed. *Stam.* Filaments ſix, awl-ſhaped, inſerted into the corolla or the receptacle; anthers oblong, erect. *Piſt.* Germ ſuperior, globular; ſtyle filiform; ſtigma obtuſe, trigonous. *Peric.* Berry globular, ſpotted before it ripens, three-celled. *Seeds* one, two, or more in each cell, one or two of the cells frequently abortive.

Eſſ. Ch. Cor. ſix-cleft. Berry ſuperior, when unripe, ſpotted; three-celled.

* *Corollas bell ſhaped.* Lilium convallium, Tourn.

Sp. 1. C. *majalis*, ſweet-ſcented lilly of the valley. Linn. Sp. Pl. 1. Mart. 1. Poir. 1. Willd. 1. Flor. Dan. tab. 854. Lam. Ill. tab. 248. Eng. Bot. 1035. Gært. tab. 16. fig. 6. (Lilium convallium alpinum & latifolium; Bauh. Pin. 304. Polygonatum; Hall. n. 1241.) "Scapus ſemicylindrical; flowers in racemes, ſomewhat unilateral, nodding." *Root* perennial, matted, creeping. *Leaves* radical, two, on long petioles, elliptical, ribbed, entire, acute; petioles equitant, inveſted with ſcales. *Scapus* extra-foliaceous, ſolitary, erect, ſimple. *Flowers* white, pedicelled, alternate, bracteate, ſweet-ſcented; ſegments recurved; pedicels recurved; ſtamens ſhort; ſtyle club-ſhaped, triangular upwards. *Berry* ſcarlet when ripe. It varies in having broader or narrower leaves. A native of woods, particularly in hilly countries. 2. C. *japonica*, graſs-leaved lilly of the valley. Linn. Jun. Supp. 204. Mart. 2. Poir. 2. Willd. 2. Thunb. Flor. Jap. 139. (Monds. Kæmp. Amœn. with a figure.) "Scapus two-edged; flowers in racemes, unilateral; leaves linear, three times longer than the ſcapus." *Root* perennial, tuberous. *Root-leaves* about ten, two feet long, drawn to a point at the bottom, triangular, ſtriated, bent back. *Scapus* finely ſtriated, ſeven inches long, quadrangular. *Flowers* white; peduncles aggregate, from two to ſix together, from one to four flowered; bracte lanceolate, white, ſhorter than the peduncle; diviſions of the corolla lanceolate, ſpreading. *Berry* blue, about the ſize of a pea, egg-ſhaped. *Seed* ſolitary, filling the berry. There is a variety with leaves about ſeven inches long, twice the length of the ſcapus. A native of Japan, introduced into England in 1784. 3. C. *ſpicata*. Mart. 3. Poir. 3. Willd. 3. Thunb. Jap. 141. "Scapus ſtriated; raceme ſpiked; flowers aggregate." *Root* perennial, fibrous. *Leaves* linear, narrowed towards the baſe, ſomewhat obtuſe, much ſtriated, longer than the ſcapus. *Scapus* from four inches to a foot high, upright, ſimple, angular, ſtriated, ſmooth. *Flowers* violet, cluſtered without order in a ſpike-like raceme; peduncles very ſhort, cylindrical, ſpreading, ſmooth, one-flowered; corolla almoſt globular, ſo deeply divided as to appear ſix-petalled; diviſions egg-ſhaped, obtuſe, concave; filaments inſerted into the germ, Thunb. (receptacle, Poir.); anthers egg-ſhaped, erect, two-celled; germ ſix-ſtriated, ſmooth; ſtyle erect, white, ſhorter than the ſtamens; ſtigma ſimple. *Fruit* not ſufficiently known. A native of Japan, flowering in September.

** *Corollas funnel-ſhaped.* Polygonatum, Tourn.

4. C. *verticillata*, narrow-leaved Solomon's ſeal. Linn. Sp. Pl. 2. Mart. 4. Poir. 4. Willd. 4. Eng. Bot. 128. (Polygonatum; Hall. n. 1244. P. anguſtifolium non ramoſum; Bauh. Pin. 303. Tourn. Inſt. 78. *β*. ramoſum; Bauh. Pin. 304.) "Leaves in whorls." *Root* perennial, fleſhy, creeping. *Stems* two feet high, erect, commonly ſimple, angular, ſmooth, naked near the bottom. *Leaves* three or four in a whorl, five or ſeven at the top of the ſtem, lanceolate, acute, ſeſſile, glaucous underneath; ſtipules none. *Flowers* white, green at the tip; peduncles axillary, ſolitary, ſlender, branched, drooping, two or three-flowered; corolla a little narrowed at the mouth of the tube; diviſions bearded within under the tip, rather obtuſe; ſtamens ſhort, inſerted into the mouth of the tube; ſtyle ſhort. *Berry* globular, blue. There is a branched variety, deſcribed by Cluſius and others as a diſtinct ſpecies. A native of many parts of Europe, of Scotland, but not of England. 5. C. *polygonatum*, angular Solomon's ſeal. Linn. Sp. Pl. 3. Mart. 5. Poir. 5. Willd. 5. Flor. Dan. tab. 377. Eng. Bot. 280. Woodv. Med. Bot. tab. 44. (Polygonatum latifolium vulgare; Tourn. Inſt. 78. Hall. Helv. n. 1242. P. latifolium flore majore odoro; Bauh. Pin. 303. Barrel. Ic. 711.) "Leaves alternate, half-embracing the ſtem; ſtem angular; peduncles axillary, generally one-flowered." *Root* perennial, creeping, fleſhy, full of knots, which, when cut obliquely, are figured with veins, with ſomewhat of the appearance of a ſeal, whence it is ſaid to have obtained the name of Solomon's ſeal. *Stems* ſeveral, a foot and half high, erect, nodding at the top, ſimple, leafy half way down, angular, ſomewhat two-edged, zig-zag, ſmooth. *Leaves* nerved, ſmooth, unilateral. *Flowers* white, with a green line down the ſegments, nodding, ſweet-ſcented: * unilateral on the ſide oppoſite the flowers; peduncles axillary, ſolitary or in pairs, almoſt always one-flowered; corolla oblong, a little narrowed in the middle; diviſions ſpreading, bearded; ſtamens inſerted into the middle of the tube; anthers projecting beyond the baſe of the diviſions; ſtyle half an inch long. *Berry* blue, with three ſeeds. A native of England and other parts of Europe. The root is mucilaginous, and in times of ſcarcity has been made into bread. It has long been employed as a diſcutient poultice to various kinds of tumours, but more particularly to bruiſes, accompanied with extravaſation of blood in the cellular membrane. It is alſo recommended as a coſmetic; and in the time of Galen was uſed by women to remove pimples and freckles of the ſkin. The berries, flowers, and leaves are extremely acrid, and ſaid to be poiſonous; but Poiret has often eaten the young ſhoots in ſpring and found them as tender and wholeſome as thoſe of aſparagus. 6. C. *multiflora*.

flora. Many-flowered or common Solomon's ſeal. Linn. Sp. Pl. 4. Mart. 7. Poir. 6. Willd. 6. Flor. Dan. tab. 152 Eng. Bot. tab. 279. (Polygonatum latifolium maximum; Bauh. pin. 303. Tourn. Inſt. 78. Hall. helv. n. 1243.) "Leaves alternate, embracing the ſtem, ſtem cylindrical; peduncles axillary, many-flowered." *Root* perennial, creeping, fleſhy, knotted. *Stems* two feet high or more, ſimple, leafy, nodding. *Leaves* elliptical, nerved, a little paler than thoſe of C. polygonatum. *Flowers* white, green at the baſe and tip; peduncles ſolitary, about five-flowered; tips of the diviſions of the corolla ſcarcely bearded; ſtamens inſerted into the top of the tube; ſtyle half an inch long. *Berry* blueiſh black. A native of England and other parts of Europe, chiefly in mountainous parts of the country. The root has ſimilar properties to thoſe of the preceding ſpecies; the young ſhoots are likewiſe eſculent. 7. C. *hirta.* Poir. 7. Boſc. act. ſoc. h. nat. Paris. "Leaves alternate, a little embracing the ſtem; ſtem hiſpid; peduncles with about three flowers." *Root* ſpreading. *Stem* about a foot high, crooked, angular, ſprinkled with white ſtiff hairs. *Leaves* egg-ſhaped, broad, ending in a long obtuſe point; nerves of the inferior ſurface hairy. *Flowers* nodding, unilateral; peduncles axillary, about an inch long, villous. A native of North America, introduced into the Paris garden in 1789. 8. C. *latifolia.* Mur. ſyſt. veg. 334. Mart. 6. Poir. 8. Willd. 7. Jacq. Auſt. 3. tab. 232. "Leaves alternate, embracing the ſtem, acuminate; ſtem angular; peduncles axillary, many-flowered." This ſpecies has the habit of C. multiflora, the flowers of C. polygonatum, and the leaves of C. majalis. *Root* ſmall, ſpreading, fleſhy, very mucilaginous. *Stem* a foot and a half or two feet high, cylindrical at the baſe, then angular to the ſummit. *Leaves* egg-ſhaped, much nerved, quite entire; nerves of the under ſurface ſlightly villous when viewed through a lens. *Flowers* three times larger than thoſe of C. multiflora, white, green at the top, and marked lengthwiſe with greeniſh lines, nodding; peduncles ſlightly villous; ſtamens attached to the middle of the tube. *Berry* globular, blueiſh black. *Seeds* three or four, ſometimes five, in each cell. A native of Auſtria, on woody mountains.

*** *Corollas wheel-ſhàped.* Smilaces, Tourn.

9. C. *racemoſa.* Linn. Sp. Pl. 5. Mart. 8. Poir. 9. Willd. 8. Bot. Mag. tab. 899. (Polygonatum racemoſum; Corn. Canad. 36. tab. 37. Pluk. Alm. 301. tab. 311. fig. 2.) "Leaves ſeſſile; raceme terminal, compound." Linn. "Leaves alternate, ſeſſile, egg-ſhaped, acuminate; panicle terminal, naked." Wiilld. *Stem* two or three feet high, ſtiff, angular, flattened, zig-zag. *Leaves* nerved, thin, flexible, green on both ſides, ſlightly ciliated at the edges. *Flowers* white, very ſmall, on ſmall alternate branches, with ſhort peduncles; corolla open, divided almoſt to the baſe; diviſions egg-ſhaped, a little ſhorter than the ſtamens; anthers large, yellowiſh. *Berries* ſmall, red. A native of North America, called Oiole Nowote, child's phyſic, by the Cherokee Indians. It is a hardy perennial, eaſily propagated by parting the roots, but thrives moſt in a light ſoil and ſhady ſituation. 10. C. *ſtellata.* Linn. Sp. Pl. 6. Mart. 9. Poir. 10. Willd. 9. (Polygonatum virginianum. Moris. hiſt. 3. tab. 4. fig. 7. P. canadenſe; Corn. Canad. tab. 33.) "Leaves embracing the ſtem, numerous." Linn. "Leaves alternate, embracing the ſtem, elliptical, ſomewhat acute; raceme terminal, ſimple." Willd. *Root* white, ſpreading horizontally. *Stem* about two feet high, thick, not angular, weak, almoſt hollow within. *Leaves* growing very near together, large, even ſurfaced, ſmooth, ſlightly ciliated, green on both ſides. *Flowers* white, in a cloſe ſpike; corolla large, open, ſtellate, divided almoſt to the bottom; ſegments linear, obtuſe, ſtamens half the length of the corolla; filaments capillary; anthers yellow, ſmall, roundiſh; ſtyle the length of the ſtamens; ſtigma obtuſe. *Berries* red. A native of North America. 11. C. *trifoliata.* Linn. Sp. Pl. 7. Mart. 10. Poir. 11. Willd. 10. (C. floribus racemoſis, foliis ovatis oblongis; Gmel. Sib. 1. tab. 6.) "Leaves embracing the ſtem, in threes; raceme terminal, ſimple." *Root* perennial, long, jointed, knotty, with ſhort ſlender filaments at each joint. *Stem* about three or four inches high, ſlender, crooked. *Leaves* generally three together, oblong, rarely lanceolate, rather acute, even-ſurfaced, ſmooth, nerved, green on both ſides. *Flowers* ſmall, on long ſimple peduncles; corolla open, deeply divided; diviſions ovate-acute; ſtamens very ſhort, inſerted into the receptacle; germ roundiſh. *Berries* red, round. *Seeds* two or three, yellowiſh, compreſſed, pointed. A native of the foreſts in Siberia. 12. C. *biſolia.* Linn. Sp. Pl. 8. Mart. 11. Poir. 12. Willd. 11. Flor. Dan. tab. 291. Bot. Mag. Pl. 510. (Lilium convallium minus; Bauh. pin. 304. Barrel. Icon. 1212. Unifolium; Hall. helv. n. 1240.) "Leaves heart-ſhaped; flowers tetrandrous." *Root* perennial, ſmall, fibrous, creeping. *Root-leaves* ſolitary, on long petioles, ſpringing from diſtant parts of the root. *Stem* from a different part of the root, two or three inches high, ſlender, ſlightly angular. *Stem leaves* generally two, petioled, a little nerved, heart-ſhaped, acute, with two rounded lobes and ſome ſtiff hairs at the baſe. *Flowers* white, ſmall, ſhorter than the peduncles; peduncles very ſlender, quite ſimple, ſometimes two together, from the axil of a ſmall ſcale at their baſe; corolla deeply four-cleft; diviſions oval, open; ſtamens four; filaments long; anthers ſmall, ſhorter than the corolla; ſtyle ſhort, thick; ſtigma ſlightly bifid or trifid. *Berries* red, ſmall, two or three-celled. A native of the mountainous parts of Europe, abundant in Sweden. Poiret obſerves that the petioled leaves are a rare ſingularity in the family of the Liliaceæ.

Propagation and Culture.—The lilly of the valley requires a looſe ſandy ſoil and a ſhady ſituation. It is propagated by parting the roots in autumn, placing the ſets a foot aſunder. This ſhould be done every third or fourth year; their flowers will elſe be ſmall and few. All the ſorts of Solomon's ſeal are hardy. They prefer a light ſoil and ſhady ſituation, and are proper to ornament plantations which are not crowded with ſhrubs. They are propagated in the ſame manner and require the ſame treatment as the lilly of the valley. Miller.

CONVENÆ, in *Ancient Geography*, a people of Gaul, who derived their name from the Latin *convenire.* They were eſtabliſhed by Pompey, after his return from the Spaniſh war, againſt Sertorius, at the foot of the Pyrenées. Their country is Cominges.

CONVENT, from the Latin *conventus, meeting*, of *convenire, to come together*; a monaſtery of religious, of either ſex. See Monastery.

Convents are very numerous in Greece, as well as in many Popiſh countries; and they are generally, though not univerſally, ſanctuaries conſecrated to ignorance, ſuperſtition, and moſt frequently to ſloth. In the Grecian iſlands, the monks are denominated *caloyers*, from καλος, *kalos*, good, and γέρος, *geros*, old man, *q. d.* good old man. However, the Grecian convents are the habitations, not merely of old men, but of young boys, from 10 to 12 years of age, cloathed in the habit, which conſiſts of a plain long black gown, confined by a girdle.

CONVENTA Pacta. See Pacta.

CONVENTI, Giulio Cesare, in *Biography*, a Bologneſe ſculptor, who is ſpoken of in high terms by Malvaſia, in his deſcription of the magnificent funeral of Agoſtino Caracci, upon which occaſion Conventi modelled a beautiful figure of virtue, which, with another, perſonifying honour, was repreſented, crowning with laurel, the buſt of the deceaſed artiſt. The celebrated ſculptor, Algardi, received his firſt inſtruction in modelling from this maſter. Malvaſia.

CONVENTICLE, a diminutive of *convent*, denoting, properly, a cabal, or ſecret aſſembly, of a part of the monks of a convent, to make a brigue or party in the election of an abbot.

From the ill uſe of theſe aſſemblies, the word is come into diſrepute; and now ſtands for any miſchievous, ſeditious, or irregular aſſembly. F. Doucine obſerves, the occidentals always eſteemed the fifth general council an unlawful conventicle. The term conventicle is ſaid, by ſome, to have been firſt applied in England to the ſchools of Wickliff; and has been ſince uſed to ſignify the religious aſſemblies of all in this country, who do not conform to the eſtabliſhed doctrines and worſhip of the church of England.

Conventicle, however, in ſtrict propriety, denotes an unlawful aſſembly; and cannot, therefore, be juſtly applied to the legal aſſemblies of proteſtant diſſenters, in places of worſhip certified, or licenſed, according to the requiſitions of law. See TOLERATION.

This term occurs in the ſtatutes 2 Hen. IV. c. 15, and 1 Hen. VI. c. 3; and 16 Car. II. c. 4. (A. D. 1664), which ſtatute was made to prevent and ſuppreſs conventicles. This ſtatute, which was enacted for three years, having expired, was revived A.D. 1670, by 22 Car. II. c. 1. which enacted, that if any perſons of the age of ſixteen years, ſubjects of this kingdom, ſhall be preſent at any conventicle, where there are five or more aſſembled, they ſhall be fined 5*s*. for the firſt offence, and 10*s*. for the ſecond; and perſons preaching incur a penalty of 20*l*. for the firſt, and 40*l*. for the ſecond offence. Alſo, ſuffering a meeting to be held in a houſe, &c. is liable to 20*l*. penalty. Juſtices of peace, on the oath of two witneſſes, or any other ſufficient proof, may record the offence under their hands and ſeals, and this record ſhall be taken in law for a full and perfect conviction, and ſhall be certified at the next quarter-ſeſſions. They, and alſo conſtables, head-boroughs, &c. have power to enter ſuch houſes, and ſeize perſons aſſembled, &c. And if they neglect their duty, they ſhall forfeit 100*l*. And if any conſtable, &c. know of ſuch meetings, and do not inform a juſtice of peace, or chief magiſtrate, &c. he ſhall forfeit 5*l*.

"One clauſe in this act," ſays Mr. Hume (Hiſt. vol. vii. p. 457,) "is remarkable; that if any diſpute ſhould ariſe with regard to the interpretation of any part of the act, the judges ſhould always explain the doubt in the ſenſe leaſt favourable to conventicles; it being the intention of parliament entirely to ſuppreſs them. Such was the zeal of the commons, that they violated the plaineſt and moſt eſtabliſhed maxims of civil policy, which require, that in all criminal proſecutions, favour ſhould always be given to the priſoner." The perſecution under this act continued to be very ſevere, till the operation of the act was ſuſpended by the exerciſe of a diſpenſing power, and the king's declaration of indulgence, A. D. 1671–2. However, alderman Love, member for the city of London, in the name of the diſſenters, diſavowed the diſpenſing power, though it had been exerciſed in their favour, becauſe, as he declared in his ſpeech, "he had rather go without his own deſired liberty, than have it in a way ſo deſtructive of the liberties of his country, and the proteſtant intereſt; and this (he ſaid) was the ſenſe of the main body of diſſenters." At length it was ordained, by the ſtat. 1 W. & M. ſt. 1. c. 18. that proteſtant diſſenters ſhall be exempted from penalties; though if they meet in a houſe with the doors locked, barred, or bolted, ſuch diſſenters ſhall have no benefit from that ſtatute. By ſtat. 10 Anne, c. 2. officers of the government, &c. preſent at any conventicle, at which there ſhall be ten perſons, if the royal family be not prayed for in expreſs words, ſhall forfeit 40*l*. and be diſabled. See NONCONFORMISTS and TOLERATION.

CONVENTION, in our *Law-Books*, is uſed when a parliament is called, which ſits and is diſſolved without any act paſſed, or judgment given. It is then ſaid not to be a *ſeſſion* of parliament, but a *convention*. See CONVENTION *infra*.

CONVENTION *of Rouen*, the ſame with burſe of Rouen.

CONVENTION, a treaty, contract, or agreement between two or more parties. See CONTRACT.

Every convention between men, provided it be not contrary to honeſty, and good manners, produces a natural obligation, and makes the performance a point of conſcience.

Every convention has either a name, and a cauſe or conſideration, or it has none: in the firſt caſe, it obliges civilly and naturally; in the latter only naturally.

CONVENTIONS *entre ſoverains pour reſtitution des deſerteurs*, conventions among ſovereigns for reſtitution of deſerters. By theſe ſorts of *conventions*, the deſerters from all armies are taken up or arreſted, if they get into the territories of a power, that is in agreement with that whoſe colours they have deſerted. Notice is given to the neareſt commandant, who ſhould ſend people to find the deſerters at the expence of the corps, and ſhould pay thoſe who took them up, for their ſuſtenance or ſupport during the time of their detention.

CONVENTION *ſecrètes entre les officers d'un corps*, ſecret conventions among the officers of a corps. See CONCORDAT.

Secret conventions are alſo made in a treaty of peace, reciprocally agreed on, and concluded between the parties, who have received powers to treat. Then theſe conventions remain ſecret and concealed, till what was agreed on between the treating and contracting parties is put in execution.

CONVENTION is much uſed both in ancient and modern pleadings, for an agreement or covenant,

In the book of rolls of the manor of Hatfield in Yorkſhire, we have a record of a pleaſant convention, anno 11 Edw. III. between Robert de Roderham, and John de Ithen; the latter of whom ſold the devil in a ſtring for three-pence halfpenny to the former, to be delivered on the fourth day after the convention; when, the purchaſer making his demand, the ſeller refuſed to give him livery, to the great loſs (as the record repreſents it), of forty ſhillings to the purchaſer, &c. But it appearing to the court, that ſuch a plea does not lie among Chriſtians, the parties were adjourned to hell for judgment.

CONVENTION is alſo the name given to an extraordinary aſſembly of parliament, or of the ſtates of the realm, held without the king's writ. Of this kind was the parliament which reſtored Charles II. This parliament met above a month before his return, the lords by their own authority, and the commons, in purſuance of writs iſſued in the name of the keepers of the liberty of England, by authority of parliament; and ſat full ſeven months after his reſtoration, and enacted ſeveral laws ſtill in force.

The neceſſity of the caſe, in this inſtance, ſuperſeded all law; for if they had not ſo met, it was morally impoſſible that the kingdom ſhould have been ſettled in peace. After the king's return, the firſt thing that was done, was to paſs an act, declaring this to be a good parliament, notwithſtanding the defect of the king's writs. (Stat. 12 Car. II. c. 1.) Nevertheleſs, though the king himſelf, who alone had a right to object, conſented to wave the objection, it was at that time a great doubt among the lawyers (1 Sid. 1.) whether even this healing act made it a good parliament, and held by very many, ſays judge Blackſtone, in the negative: though, as he adds, it ſeems to have been too nice a ſcruple. And yet, out of abundant caution, it was thought neceſſary to confirm its acts in the next parliament, by ſtatute 13 Car. II. c. 7. & c. 14.

The convention of eſtates, in 1688, after the retreat of king James II. upon mature deliberation, came to a concluſion, that king James, by his practices here, and his flight hence, had abdicated the kingdom; and that the throne was vacant; and therefore devolved to king William and queen Mary. Upon this their aſſembly expired as a convention, and was converted into a parliament.

In this caſe, the lords and commons, by their own authority, and upon the ſummons of the prince of Orange (afterwards king William) met in a convention, and therein diſpoſed of the king and the kingdom. On this occaſion, the peers and biſhops, to the number of near 90, addreſſed the prince, deſiring him to ſummon a convention by circular letters. In order to ſatisfy his mind by a more general and expreſs declaration of the public conſent, the following judicious expedient was adopted. All the members who had ſitten in the Houſe of Commons during any parliament of Charles II., were invited to meet; and to them were added the mayor, aldermen, and fifty of the common council of London. This was regarded as the moſt proper repreſentative of the people that could be ſummoned during the preſent emergency. They unanimouſly voted the ſame addreſs with the lords. The prince, being thus ſupported by all the legal authority which could poſſibly be obtained in this critical conjuncture, wrote circular letters to the counties and corporations of England, and his orders were univerſally complied with. Accordingly, the Engliſh convention was aſſembled, June 22, 1689, and a vote was paſſed in a few days by a great majority of the commons, and ſent up to the peers for their concurrence. The words which expreſſed it were theſe, "that king James II. having endeavoured to ſubvert the conſtitution of the kingdom, by breaking the original contract between king and people; and having, by the advice of Jeſuits, and other wicked perſons, violated the fundamental laws, and withdrawn himſelf out of the kingdom, has abdicated the government, and that the throne is thereby vacant." (See Abdication.) The vote was carried to the upper houſe, and there met with great oppoſition. After long debate, and free conference between the houſes, and after having obtained the ſentiments of the prince, with regard to the ſettlement of the government, the chief parties agreed, and the convention paſſed a bill; in which they ſettled the crown on the prince and princeſs of Orange; the ſole adminiſtration to remain in the prince: the princeſs of Denmark to ſucceed after the death of the prince and princeſs of Orange; her poſterity after thoſe of the princeſs, but before thoſe of the prince by any other wife. The convention annexed to this ſettlement of the crown, a declaration of rights, where all the points which had of late years been diſputed between the king and people, were finally determined; and the powers of royal prerogative were more narrowly circumſcribed, and more exactly defined, than in any former period of the Engliſh government. See Constitution.

This convention was aſſembled upon a ſimilar principle of neceſſity with that of the reſtoration; that is, upon a full conviction, that king James had abdicated the government, and that the throne was thereby vacant; which ſuppoſition of the individual members was confirmed by their concurrent reſolution, when they actually aſſembled. In ſuch a caſe as the palpable vacancy of the throne, it follows "*ex neceſſitate rei*," that the form of the royal writs muſt be laid aſide, otherwiſe no parliament can ever meet again. Let us ſuppoſe, for the ſake of argument, that the whole royal line ſhould at any time fail, and become extinct, which would indiſputably vacate the throne; in this ſituation, it ſeems reaſonable to preſume, that the body of the nation, conſiſting of lords and commons, would have a right to meet and ſettle the government, otherwiſe there muſt be no government at all. Upon this, and no other principle, ſays judge Blackſtone, did the convention in 1689 aſſemble. The vacancy of the throne was precedent to their meeting, without any royal ſummons, not in conſequence of it. They did not aſſemble without writ, and then make the throne vacant; but, the throne being previouſly vacant by the king's abdication, they aſſembled without writ, as they muſt do if they aſſembled at all. Had the throne been full, their meeting would not have been regular; but, as it was really empty, ſuch meeting became abſolutely neceſſary. Accordingly, it is declared by ſtatute 1 W. & M. ſt. 1. c. 1. that this convention was really the two houſes of parliament, notwithſtanding the want of writs, or other defects of form.

A ſimilar convention, by circular letters from the prince, was ſummoned at Edinburgh, on the 22d of March 1689. As ſoon as the purpoſe of this convention was diſcovered, the earl of Balcarras, and viſcount Dundee, leaders of the tories, withdrew from the city; and the convention having paſſed a bold and deciſive vote, that king James, by his mal-adminiſtration and abuſe of power, had *forfeited* all title to the crown, they made a tender of the royal dignity to the prince and princeſs of Orange.

The conſtitution of Great Britain having placed the repreſentation of the nation, and the expreſſion of the national will in the parliament, no other meeting or convention, even of every individual in the kingdom, would be a competent organ to expreſs that will; and meetings of ſuch a nature tending merely to ſedition, and to delude the people into an imaginary aſſertion of rights, which they had before delegated to their repreſentatives in parliament, could only tend to anarchy and confuſion; and to overturn every ſettled principle of government.

Accordingly, an act of parliament was paſſed in Ireland, in the year 1793, to prevent any ſuch meetings or conventions; and a few ignorant individuals, who in the ſame year had dared to aſſemble under that title in Scotland, were quickly diſperſed, and their leaders convicted of ſeditious practices; for which they were ſentenced to tranſportation.

CONVENTIONAL Estates *for Life*, are thoſe that are expreſsly created by the acts of the parties, in contradiſtinction to ſuch as are merely *legal*, or enacted by conſtruction and operation of law. See Estate.

Conventional *Subrogation*. See Subrogation.

CONVENTIONARY Rents, in *Rural Economy*, is a term which is ſometimes applied to the reſerved rents of life leaſes. See Lease.

CONVENTIONE Facienda, in *Law*, is a writ which lies for the breach of any covenant in writing. Fitzherbert calls it a writ of *covenant*.

CONVENTUAL, ſomething belonging to a convent. See Coenobite.

Conventual is particularly uſed, ſince the year 1250, for a religious who actually reſides in a convent; in contradiſtinction to thoſe who are only gueſts, or are entertained there, or are in poſſeſſion of benefices depending on the houſe.

Conventual likewiſe denotes a claſs of the order of Franciſcans, who adopted the relaxation introduced into that order by pope Innocent IV. which allowed of property and poſſeſſions in their community. They were ſo called in oppoſition to the "Brethren of the Obſervance." This diviſion took place in the year 1368.

Conventual *Church*, denotes a church that conſiſts of regular clerks, profeſſing ſome order of religion; or of dean and chapter, or other ſocieties of ſpiritual men.

Conventual *Prior*, differs from a *clauſtral prior*, in that the former has the full right and authority of an abbot; the only difference between them being in the name: whereas the clauſtral prior is a dependent of the abbot, and derives all his authority from him.

The conventual prior is obliged to take prieſt's orders in a year, or at moſt in two years, from the day of his admiſſion: in default whereof, the benefice becomes vacant. Some priories are actually conventual, *i. e.* they are ſtocked with religious: others are only conventual *in habitu*, *v. gr.* where there have been no religious during the ſpace of forty years: the continuance of one ſingle religious, keeps the priory *conventual actu*; for, in default of one, the priory becomes ſimple. See Prior.

By a declaration of the king of France, in 1680, it was decided, that a conventuality never degenerates, or ceaſes, while there are regular places ſubſiſting in it for twelve religious, with revenues for their ſupport.

Conventual *Auditors*. See Auditor.

CONVERGENCY *of Meridians*, in *Geographical Surveying*, is the angle formed between the meridian of any place and the parallel to the meridian of any other place, drawn through the firſt mentioned place. Thus, if P (*Plate* II. *Surveying*, *fig.* 10.) be the pole of the earth, E Q a portion of the equator, P E a meridian drawn through a place or ſtation G, and P Q a meridian drawn through another place R: then, if G R be a portion of a great circle paſſing through the places G and R, and *a b* be a portion of a ſmall circle paſſing through G, parallel to the meridian of R (P Q), or perpendicular to the great circle *p* R, which is itſelf a perpendicular to the meridian P Q, in the point R, then is the angle *a* G P the angle of convergency of the two meridians P G and P R, at the place G. It is to be obſerved, that at the equator any two meridians, as E P and Q P, are parallel to each other; but on their departure from thence, they converge more and more as they approach towards the pole, where the angle of convergency (*a* G P) becomes equal to the angle of longitude E P Q. It may alſo be remarked, that the angle of convergency, augmented by the exceſs of the three angles of a ſpherical triangle above 180°, is equal to the angle of longitude at the pole, on a ſphere. Phil. Tranſ. 1787, p. 218. The principles for applying this to an ellipſoid figure of the earth, or to any other given ſpheroid, may be found in Mudge and Dalby's Trig. Survey, vol. i. art. 60, &c.

The late general Roy (Phil. Tranſ. 1787, p. 216.) has explained the mode of applying the convergency of two meridians, obtained by reciprocally obſerving the azimuth of a ſtation on each, from the other, compared with the meridian there (determined by obſervations of the pole-ſtar), to the finding of the difference of longitude, or angle at the pole between the meridians of thoſe two ſtations, by a method ſomewhat different from that recommended by the Rev. Mr. Mitchell. Phil. Tranſ. lvi. In the progreſs of the Government Trigonometrical Survey, this method was firſt applied in the finding of the difference of longitude between Botley Hill ſtation in Surrey (lat. 51° 16′ 41½″ N. and long. 0° 0′ 3″ E. of Greenwich Royal Obſervatory) and Goudhurſt ſteeple in Kent, about 23 miles diſtant; as alſo for ſettling the latitude of the latter place. Phil. Tranſ. 1790, p. 206. It was afterwards applied, in a moſt complete manner, to the determination of the difference of longitude between Beachy Head ſtation in Suſſex (lat. 50° 44′ 23.7″, long. 0° 15′ 11.9″ E.), and Dunnoſe ſtation in the Iſle of Wight, wherein the bearing of each of theſe places, with the meridian of the other, was accurately ſettled by obſervation, although the places are more than 64 miles apart; and whence, the length of a degree of a great circle of the earth, perpendicular to the meridian in latitude 50° 41′, was calculated to be 61182.3 Engliſh fathoms. The latitude of Dunnoſe ſtation, as determined by this operation, has ſince been verified by a ſeries of accurate obſervations, made with a capital zenith ſector, the laſt work of the celebrated Ramſden, and has been found to err only $\frac{9}{10}$ of a ſecond in defect. See Dunnose. This method of determining longitudes of ſtations, by the convergency of meridians, has ſince been applied to finding the longitudes and latitudes of Black-Down ſtation in Dorſetſhire, long. 2° 32′ 22.4″ W. lat. 51° 41′ 14.7″ N. of Butterton ſtation in Devonſhire, long. 3° 52′ 47.5″, lat. 50° 24′ 47.2″, and of St. Agnes Beacon in Cornwall, long. 5° 11′ 55.7″, and lat. 50° 18′ 27.9″. Phil. Tranſ. 1800. But theſe deductions ſeem not to have all the pretenſions to accuracy, of which the method is ſuſceptible, for want of reciprocal obſervations; the three laſt ſtations being ſo choſen as to be all inviſible from each other: and although the firſt of them is viſible from Dunnoſe, that ſtation was not viſited again, for the purpoſe of completing the obſervations; but one of the angles of this, and both the angles of the other two polar triangles, were made to depend on thoſe of the intermediate chains of triangles. It is with the utmoſt regret that we obſerve any opportunities omitted of ſubmitting this grand trigonometrical ſurvey to all the poſſible teſts of its accuracy, or of collecting and recording obſervations, likely to be of future uſe in drawing concluſions relative to the anomalies in the figure of the earth. The writer of this, from having aſſiſted in the making of ſome hundreds of obſervations with the admirable theodolites, which are in the hands of major William Mudge, and his able aſſiſtants employed on the trigonometrical ſurvey, and from having been a witneſs to the great ſkill and pains with which they are always uſed by theſe gentlemen, and from having ſince applied his multiplied obſervations in accurately calculating the ſituation of many different objects, by ſeries of 4 or 5, and in ſome caſes 10 or 12, independent triangles, is enabled to aſſert, that an extreme degree of accuracy in the diſtances and horizontal angles may be obtained in this ſurvey, perhaps unparallelled in any ſimilar undertaking. He laments, therefore, that Ramſden's fine zenith ſector (deſcribed Phil. Tranſ. 1804) ſhould, during any favourable ſeaſon of the year, lie idle in the Tower, inſtead of being employed in determining the actual latitudes, and, with a theodolite, making pole-ſtar obſervations, for obtaining the correct azimuths of all the many principal ſtations, whoſe horizontal bearings and diſtances have been ſo very accurately ſettled in this ſurvey; which does equal honour to the government that patronizes it, and to the gentlemen by whom it is conducted.

CONVERGING CURVES. See CURVE.

CONVERGING, or CONVERGENT *Lines*, in *Geometry*, are thoſe which continually approximate, or whoſe diſtance becomes continually leſs and leſs: in oppoſition to *divergent* lines, whoſe diſtance becomes continually greater. Lines that converge one way, diverge the other.

CONVERGING *Rays*, in *Dioptrics*, are thoſe rays which in their paſſage out of one medium into another, of a different denſity, are refracted towards one another; ſo that, if far enough continued, they will meet in a point, or focus.

All convex lenſes make the rays converge, and concave ones diverge, *i. e.* the one inflects them towards a centre, and the other deflects them from it; and the more, as ſuch lenſes are portions of ſmaller ſpheres. On which properties, all the effects of lenſes, microſcopes, teleſcopes, &c. depend.

Rays coming converging out of a denſer medium into a rarer, become more convergent, and concur ſooner than if they were to continue their motion through the firſt. Rays coming converging out of a rarer into a denſer medium, converge leſs, and concur later, than if they had continued their motion through the firſt medium.

Parallel rays, paſſing from a denſer into a rarer medium, *v. gr.* from glaſs into air, the ſurface of the glaſs being towards the air, will become convergent, and concur in a focus.

Diverging rays, or rays coming from a point, under the ſame circumſtances, become converging, and meet in a focus; and as the radiant point comes nearer, the focus recedes farther off: if the radiant be near, the focus will be infinitely diſtant; *i. e.* the rays will be parallel: and if the point be brought nearer ſtill, the rays will diverge.

CONVERGING *Series*, in *Mathematics*. See SERIES.

CONVERSANO, in *Geography*, a town of Italy, in the kingdom of Naples, and province of Bari; the ſee of a biſhop, ſuffragan of Bari; 15 miles E.S.E. of it.

CONVERSATION, DISCOURSE; theſe two words denote an interlocution between two, or among more perſons: with this diſtinction, that the converſation is uſed for any general intercourſe of ſentiments whatever; whereas a diſcourſe means a converſation limited to ſome particular ſubject. Thus we ſay, a converſable man; meaning a man able to converſe on a variety of ſubjects, or a man of general knowledge; but we do not ſay a diſcourſable man. The word diſcourſe is generally uſed when we mention a ſuperior talking to an inferior.

CONVERSATION *Point*, in *Geography*, a head-land on the ſouth ſide of a bay on the coaſt of California. N. lat. 32° 30′. W. long. 119°.

CONVERSAZIONES, denote evening aſſemblies held at Rome, where perſons of both ſexes met, not for inſtructive or even amuſing converſation, but in order to ſee and pay tranſient compliments to one another; and where a perſon may enjoy the happineſs of being ſqueezed and preſſed among the beſt company in the city. Several of theſe take place in the ſame evening, and they are formed by the paſſing viſits of the ſame perſons, who thus ſeek amuſement by a mere change of place and company. Theſe aſſemblies generally break up about 9 o'clock; a ſmall party excepted, who are invited to ſupper. They reſemble our modern *routs*. Moore's View of Society, &c. in Italy, vol. i. p. 337, &c.

CONVERSE, in *Geometry*, *&c.* A propoſition is ſaid to be the converſe of another, when, after drawing a concluſion from ſomething firſt ſuppoſed, we proceed to ſuppoſe what had been before concluded, and to draw from it what had been ſuppoſed. Thus, it is demonſtrated in geometry, that if the two ſides of a triangle be equal, the two angles oppoſite to thoſe ſides are equal alſo: the converſe of the propoſition is, that if the two angles of a triangle be equal, the two ſides oppoſite to thoſe angles are equal alſo.

CONVERSE *Direction*, in *Aſtrology*, is uſed in oppoſition to *direct* direction, *i. e.* by the latter, the promoter is carried to the ſignificator, according to the order of the ſigns: but by the former it is carried from eaſt to weſt, contrary to the order of the ſigns.

CONVERSERA, in *Geography*, an iſland of the Adriatic, near the coaſt of Iſtria. N. lat. 45° 20′. E. long. 18° 44′.

CONVERSION, in a *Moral Senſe*, a return from evil to good; reſulting from a ſenſe, either of the natural deformity of the one, and amiableneſs of the other: or of the advantages and diſadvantages that ſpring from the one and the other, reſpectively.

Or, it is the change of the heart, with regard to the morals, paſſions, deſires, and purſuits; and of the mind, with regard to the ſentiments, &c. See REGENERATION. For an account of the converſion of St. Paul, conſidered as an argument for the truth of Chriſtianity, ſee PAUL.

CONVERSION, in *Law*, is where a perſon having the goods of another in his poſſeſſion, converts them to his own uſe, without conſent of the owner; for which the proprietor may maintain an action of trover and converſion againſt him.

This action of trover and converſion was, in its original, an action of treſpaſs upon the caſe, and a recovery of damages againſt the offender, from which it derived its name. Refuſal to reſtore goods is, *primâ facie*, ſufficient evidence of a converſion, though it does not amount to a converſion. 10 Rep. 56. See TROVER.

CONVERSION, *Converſio*, in *Logic*, a circumſtance or affection of propoſitions, wherein the order of the terms, or extremes, is changed; ſo that the ſubject comes into the place of the predicate, and the predicate into that of the ſubject; without any alteration in the quality of either.

As, "No virtue is vice; No vice is virtue:" in which we ſee the ſubject of the former, made the predicate of the latter, and the predicate the ſubject; yet both true.

Converſion is uſually defined a due change of the order of the extremes, *i. e.* under ſuch a habitude and coherence with reſpect to each other, that the one is rightly inferred from the other.

Hence, in every legitimate converſion, two things are required: 1. A communication, or reciprocation of terms; not in reſpect of words, but of order. 2. The inference of one propoſition to the other.

Ariſtotle makes two kinds of converſion; the one *ſimple*, by others called *univerſal;* wherein nothing is changed beſide the order of extremes, *i. e.* the terms are tranſpoſed, without altering either the quality or quantity thereof: as, "No mind is body; No body is mind."

The ſecond, *per accidens*, called alſo *particular;* wherein, beſide changing the places of the terms, there is a change of an univerſal ſign into a particular one; as, "Every good man ſtudies the welfare of his country; ſome man that ſtudies the welfare of his country is good."

To theſe, ſome of Ariſtotle's followers add a third kind of converſion, called *by contrapoſition:* as, "Every man is an animal; every no-animal is no-man."

Conversion, in *Rhetoric, &c.* is underſtood of arguments which are returned, retorted, and ſhewn on oppoſite ſides, by changing the ſubject into the attribute, and the attribute into the ſubject.

There are converſions of arguments, from one figure to another, and alſo from general propoſitions to particular caſes. Thus Cicero againſt Antony: "Doletis tres exercitus P.R. interfectos? Interfecit Antonius. Deſiderates clariſſimos cives? Eoſque vobis eripuit Antonius. Auctoritas hujus ordinis afflicta eſt? Afflixit Antonius."

Conversion, in *War*, denotes a military movement or manœuvre, which turns the front of a battalion, where the right or left flank was, when either flank is attacked.

Conversion *of Diſeaſes.* A diſeaſe is ſaid to be converted, when new ſymptoms ariſe in its progreſs, which require a different deſignation, and which either put a period to the original diſorder, or, combining with it, alter the phyſician's views reſpecting the prognoſtics, or the method of cure. Many inſtances of this kind are familiar; as the converſion of intermittents into continued fevers, or obſtructions of the viſcera; of hœmoptöe into phthiſis; of jaundice into dropſy, and the like. Others are more unuſual, and unexpected, and deſerve to be noticed, becauſe they occaſion much perplexity in practice, when they occur, and eſpecially as this ſubject has been much overlooked by medical writers.

We owe the firſt obſervation on the ſubject of converſion, to Hippocrates, and his annotators. Hoffman has curiouſly touched on it, in his ſhort diſſertation *de morborum tranſmutatione*. Baglivi, though very deſirous that it ſhould be treated at length, and though liberal in promiſes of aſſiſtance, confines his recital of facts in a great meaſure to thoſe of Hippocrates. An expreſs treatiſe was written on the ſubject by Rodericus à Caſtro, under the quaint title of *Quæ ex Quibus*, a work better conceived than executed. And an excellent eſſay was more recently publiſhed by Dr. Ferriar, of Mancheſter, in the 2d vol. of his "Medical Hiſtories and Reflections," in which the ſubſtance of this article will be found.

This ſubject was formerly arranged under two diviſions: when the original diſeaſe ſubſiſted after the acceſſion of the ſecond, it was termed a caſe of *epigeneſis*, or *propagation*; when the ſecond diſeaſe put a period to the firſt, it was called an inſtance of *metaptoſis*, *metaſtaſis*, or *tranſlation*. But this is a looſe diſtinction, which excludes many caſes of converſion. The chief difference between the *metaptoſis* and *epigeneſis* is, that the relation of the ſucceſſive morbid appearances, and their dependence upon each other, cannot be ſo clearly perceived in one caſe as in the other. It would have been more uſeful, to have diſtinguiſhed converſions by their influence on the event of the diſeaſe; as ſome are dangerous, and generally fatal; others, while they terminate the original diſorder, conduce to a more ſpeedy reſtoration of health. Thus, when a continued fever ſupervenes to pneumonic inflammation, the patient is in great danger, it is *gravi malo grave malum accedere;* when a diarrhœa ſupervenes to continued fever, in certain ſtages, it terminates the fever earlier than the regular courſe of the diſeaſe could have done.

All caſes of converſion may perhaps be conveniently referred to the following heads. 1. The ſupervening diſeaſe may be produced by the remote cauſes of the original diſorder: in this caſe, the action of thoſe cauſes, after producing its firſt effect, is prolonged ſo as to excite a new train of ſymptoms. 2. The ſupervening diſeaſe may ariſe from the exceſs or combination of the ſymptoms of the original complaint. 3. The ſtate of the habit, produced by the firſt diſeaſe, may give riſe to a new diſorder. 4. Converſion may happen, from the imprudent ſuppreſſion of habitual diſeaſes.

I. The application of certain remote cauſes, may be ſufficiently powerful to produce a freſh diſeaſe, after the firſt has been brought on by their action. It is common to find pneumonic inflammation ſupervene to typhus, by a continuance of the application of cold or dampneſs, which operates as a remote cauſe of the fever. On the contrary, from the tendency of the ſyſtem to inflammation, or from the manner in which cold has been applied, the pneumonic ſymptoms precede the fever in ſome caſes, and even run their courſe, before the fever aſſumes a regular form. In a fatal caſe of the converſion of pleuriſy into typhus, the left lobe of the lung was deſtroyed by ſuppuration. (Lieutaud. Hiſt. Anat. Med. tom. i. Obſ. 378.) I have ſeen, ſays, Dr. Ferriar, a caſe of peripneumonia notha end in typhus, and the typhus in mania. He alſo relates, chiefly from his own obſervation, the converſion of acute rheumatiſm into typhus in the firſt week, a circumſtance which we have alſo witneſſed;—the converſion of the mild ſynochus, or typhus, into inflammation of the peritoneum, or villous coat of the inteſtines;—of cholera into typhus;—of dyſentery and diarrhœa into continued fever;—of hyſteria into epilepſy and inſanity, &c.; changes which are not very unfrequent.

Caſes of hyſterical converſions, which belong to the head, are very common ſources of error to young practitioners, and ſometimes deceive even the moſt experienced. Sydenham long ago enumerated an ample catalogue of the diſeaſes, the ſymptoms of which the maniac, hyſteria, frequently aſſumes. This maſterly eſſay, with which Dr. Ferriar appears to have been unacquainted, contains a full diſcloſure of the converſions of this diſorder. The ſymptoms of apoplexy, paralyſis, epilepſy, cough, the iliac paſſion, jaundice, ſtone in the kidneys, and in the bladder, vomiting, diarrhœa, rheumatiſm, lumbago, &c. have been terminated by the acceſſion of a complete hyſterical paroxyſm. (See Hysteria.) "We are ignorant," ſays Dr. Ferriar, who has deſcribed a ſimilar variety of hyſterical converſions, "by what laws the body poſſeſſes a power of repreſenting the moſt hazardous diſorders, without incurring danger; of counterfeiting the greateſt derangement in the ſyſtem, without materially altering its movements; of producing madneſs, conſcious of its extravagancies, and of increaſing the acuteneſs of ſenſation, oppreſſing the common ſenſorium. In hyſterical affections, all theſe appearances are excited, which are incompatible with the reaſonings of every ſyſtem-maker, who has yet endeavoured to explain the inexplicable. Nature, as if in ridicule of the attempts to unmaſk her, has, in this claſs of diſeaſes, reconciled contradictions, and realized improbabilities, with a myſterious verſatility, which inſpires the true philoſopher with diffidence, and reduces the ſyſtematic to deſpair."

II. The ſymptoms of an idiopathic diſeaſe may, by their violence, aſſume the appearance, and require the attention due to a new complaint; or affections of particular viſcera, which, in their incipient ſtate, are only regarded as ſymptoms of general indiſpoſition, may, as they gain ground, extinguiſh the original diſeaſe, or be protracted beyond it. This head comprehends ſuch a variety of caſes, that to treat it fully, would be to give the hiſtory of all ſymptomatic diſeaſes. A few illuſtrations will ſuffice.

Dr. Percival mentions, that he had ſeen an effuſion into the cavities of the brain, produced by the ſucceſſions of coughing, in a confirmed pulmonary conſumption, which effuſion terminated fatally, with a previous ſuppreſſion, more than a week before death, of all the pulmonic ſymptoms.

It is one of the moſt perplexing occurrences in medicine, when the ſupervening diſeaſe is produced by a ſymptom of ſome latent complaint: when, for example, phthiſical ſymptoms ariſe in a ſcrofulous or gouty patient, who exhibits, at firſt, no other appearance of thoſe two diſeaſes. Dr. Ferriar ſaw an inſtance, in which all the characters of confirmed phthiſis pulmonalis were preſent, that terminated in recovery, upon the patient's coughing up ſome ſolid particles, which, upon examination, proved to be chalk-ſtones. Dr. Percival relates, that a gentleman of rank was ſuppoſed to be in an advanced ſtate, of what is called a galloping conſumption, having an inceſſant cough, an expectoration apparently purulent, continued heats, and night ſweats: yet his cure was accompliſhed by giving wine-whey copiouſly, and by adminiſtering doſes of hartſhorn and ſpermaceti. A gentle fit of the gout was produced by this cordial regimen. The fever, cough, and ſpitting, were progreſſively diminiſhed, and the health of the patient was ſoon perfectly re-eſtabliſhed.

There is, indeed, a ſtrong reſemblance between hyſteria and gout, in the power of counterfeiting different diſeaſes, but with this material diſtinction; that the hyſterical repreſentations are commonly void of danger, while thoſe produced by gout are often more dangerous than the ſimple diſorder which they imitate. The hyſterical hæmoptöe, for example, is ſeldom productive of bad conſequences, but the arthritic apoplexy, pneumonia, and cardialgia, are much more alarming, and run their courſe quicker than ſimilar complaints originating from other cauſes. But theſe diſeaſes agree in this reſpect, that the acceſſion of the regular paroxyſm puts a favourable period to the irregular ſymptoms.

The prognoſtics, in converſions of this ſecond claſs, muſt evidently vary according to the ſeat and degree of the ſupervening diſeaſe, and its favourable action upon the original diſorder.

III. The original diſeaſe, if acute, when it has run its uſual courſe, may leave the habit in a ſtate favourable to the production of another diſeaſe: or if the original be a chronic diſorder, ſuch a ſtate of the habit may take place during its continuance, and the acceſſary diſeaſe may be ſimply ſuperadded, or it may vary the form, or affect the duration of the former.

Continued fevers are converted into different diſeaſes, the production of which admits one general explanation. During the increaſed action of the circulating ſyſtem, if any part of the body be originally weak, or have been rendered infirm and irritable by preceding diſeaſe, congeſtion, and its conſequences, may be expected there. It is therefore eaſy to conceive, why one patient ſhould ſuffer a paralytic affection, another phthiſis, or a third nephritis, in conſequence of tedious caſes of typhus. The glandular ſuppurations, conſequent on fevers, ſeem to depend on the ſame principle; for although they are repreſented as critical, by the older medical writers, we ſometimes ſee ſtriking proofs of the contrary. The exanthemata are frequently converted into diſeaſes, which become both chronic and dangerous. The ſmall-pox often produces ſevere coughs, diarrhœa, and ophthalmia. In ſome rare inſtances, tumours of the joints ſupervene, which ſuppurate and deſtroy the patient. The pneumonic inflammation attending the meaſles, is too often converted into phthiſis pulmonalis. Glandular ſwellings, and general dropſy, frequently ſucceed the ſcarlatina anginoſa. There is a curious caſe in Dr. Percival's Eſſays, Medical and Experimental, (vol. i. p. 148.) of a woman, in whom a converſion of fever took place, firſt into palſy, afterwards into epilepſy, and then into amauroſis. Fevers often terminate in hyſterical diſorders, eſpecially in women. Nephritis alſo is a common converſion of fever: it ſeldom ſupervenes with conſiderable violence, excepting in perſons who have formerly undergone it; but when it has been familiar to the patient, a very large quantity of gravel is commonly paſſed, with extraordinary pain in the ſtate of converſion. The acceſſion of nephritis always extinguiſhes the fever. Other converſions of fever have been noticed, ſome of them peculiar to certain epidemics.

Various inſtances of converſion of diſeaſes, under this head, may be found in the writings of phyſicians. Jaundice is ſaid, by Baglivi, to be converted to tympanites; tympanites, by Dr. Ferriar, to diarrhœa and iſchuria; dyſpeptic complaints of long ſtanding, to general dropſy; aſcites to chronic inflammation of the bowels, and diarrhœa, which generally prove fatal; mania, as obſerved by Dr. Mead, to fatal epilepſy; and alſo to a cutaneous eruption, with recovery; &c. &c.

IV. Converſions may ariſe, when a diſeaſe, regular in its uſual courſe, or long familiar to the habit, is violently terminated by improper methods, or ſuddenly extinguiſhed by accidental circumſtances.

Thus epileptic fits have been produced by the retroceſſion of the itch, in conſequence of ſome external application; the epilepſy having reſiſted all the uſual methods of treatment, was only cured by producing the itch. Inſtances of the production of melancholy and madneſs, by the ſuppreſſion of eruptions, or the healing of old ulcers, and habitual drains, are common in practical writers.

The diſeaſes originating from the ſuppreſſion of the menſtrual and hæmorrhoidal diſcharges are alſo well explained in different books. Dr. Hoffman's treatiſe, *De Morborum tranſmutatione*, relates almoſt entirely to this claſs of diſorders. Tedious dyſpeptic caſes are often converted to cutaneous eruptions, in diſtinct pimples, of a fiery red colour; ſuch eruptions extinguiſh the complaint in the ſtomach. Examples of converſions might be multiplied infinitely: but we muſt here content ourſelves with adverting to the important concluſions, reſpecting the prognoſtics and cure of diſeaſes, which may be drawn from an obſervation of thoſe phenomena. The following moſt obvious deductions have been pointed out and illuſtrated by Dr. Ferriar.

1. Whenever local inflammation ſupervenes to an acute diſeaſe, it ſhortens or extinguiſhes the original diſorder. The danger, or ſalubrity of this converſion, appears to depend greatly on the nature of the part attacked by inflammation. In fever, for inſtance, if it be a conglobate, or conglomerate gland, the prognoſis will be favourable, but if the brain, the pleura, or the peritoneum, be inflamed, the danger is increaſed. In the former caſe, the cure of the fever may be in a great meaſure truſted to the ſupervening diſeaſe; in the latter, the progreſs of the inflammation will demand our chief attention. Thus, however, contra-indications will be avoided, and the ſafety of the patient will be better conſulted, than by the temporizing practice uſually adopted on ſuch occaſions.

This deduction ſerves alſo to explain the action of bliſters, which, by producing local inflammation, imitate the proceſs, and, in proportion to their action, exhibit the effect of this kind of converſion. It explains alſo the ſalubrity of the gouty inflammation, when it ſeizes a part not neceſſary to life.

2. It is ſo far certain, that medicines operate by producing converſions, that we perceive very conſiderable diſeaſes reſulting from the uſe of certain remedies, ſuch as mercury; and we judge of the extinction of the original complaint, in ſome meaſure, by the increaſe and permanency of the

remedial diſeaſe. Thus when we give diuretics, or cathartics, we endeavour to excite a diſeaſe in the inteſtines, or kidneys; for an extreme increaſe of natural action, in any part, is certainly morbid. In like manner, Dr. Darwin has obſerved, that ſome derangements of mind cannot be removed, without exciting an artificial delirium.

3. The convulſion denominated hyſterical, when it ſeizes the muſcular fibre, in caſes of converſion, is always ſalutary, and may be regarded, in many inſtances, as the criſis of chronic diſorders.

4. Internal inflammation, ſupervening to chronic diſeaſes, has a leſs tendency to extinguiſh the original complaint, than a ſimilar converſion of acute diſorders, and is equally dangerous.

5. Cutaneous eruptions often extinguiſh dangerous diſeaſes. Excepting the regular exanthemata, ſuch converſions ſeldom happen in acute diſorders. But madneſs and melancholy, epilepſy, delirium, protracted after fever, dyſpepſia, various pulmonary affections, are all obſerved to be mitigated, or removed, on the appearance of cutaneous diſorders; eſpecially on the return of thoſe, which, after becoming familiar, had been ſuddenly ſuppreſſed.

6. As it appears that many converſions are proceſſes, conſtituted by nature for the cure of diſeaſes, and that ſome of the moſt active remedies operate in a ſimilar manner, we may not only improve the hiſtory of diſeaſes, but the practice of medicine, by paying cloſer attention to the connection and operation of diſorders upon each other. With this view of the ſubject, the moſt complicated caſes will admit an inſtructive developement, and every additional fact may find an uſeful place. See Metastasis.

Conversion *of equations*, in *Algebra*, is when the quantity ſought, or any part thereof, being in fractions, the whole is reduced to one common denomination; and then, omitting the denominators, the equation is continued in the numerators only.

Thus, ſuppoſe $a-b=\frac{aa+cc}{d}+h+b$; multiply all by d, and it will ſtand thus, $da-db=aa+cc+dh+db$.

In arithmetic, we uſe the term *proportion by converſion of ratio*, for a compariſon of the antecedent, and conſequent, in two equal ratios.

Thus, as there is the ſame ratio between two and three, as between eight and twelve; it is concluded there is the ſame ratio between two and one, as between eight and four.

Or, according to Euclid (lib. v. Def. 17.), it is the inference, in the caſe of four proportionals, that the firſt is to its exceſs above the ſecond, as the third is to its exceſs above the fourth.

E.G. If we have - - - - - - 8 : 6 :: 4 : 3.
Then convertendo, or by converſion, 8 : 2 :: 4 : 1.
Or, if we have - - - - - - - - $a : b :: c : d$.
Then convertendo - - - - - - $a : a-b :: c : c-d$.

Conversion, *Centre of.* See Center.

CONVERSOS. See Convert.

CONVERT, a perſon who has undergone Conversion.

Convert is chiefly uſed in reſpect of changes from one religion, or religious ſect, to another.

Converts with relation to the religion turned to, are denominated *apoſtates* with regard to that they have relinquiſhed.

The Jews formerly converted to Chriſtianity in England, were called *converſos*. Henry III. built them a houſe in London, and allowed them a competent ſubſiſtence for their lives; which houſe was called *domus converſorum*. But the number afterwards increaſing, they became a burthen to the crown; upon which they were diſtributed among the monaſteries: and after the expulſion of the Jews under Edward III. the *domus converſorum* was given for keeping of the rolls.

Converts, in a *Monaſtic Senſe*, are lay-friars, or brothers, admitted for the ſervice of the houſe; without orders, and not allowed to ſing in the choir.

Till the eleventh century, the word was uſed for perſons who embraced the monkiſh life at the age of diſcretion; by which they were diſtinguiſhed from thoſe devoted in their childhood by their parents, called *oblati*.

But in the eleventh century, when they began to receive into monaſteries illiterate perſons, incapable of being clerks, and only deſtined for bodily labour; the ſignification of the word was neceſſarily changed. F. Mabillon obſerves, that it was John, firſt abbot of Vallombroſa, who firſt introduced theſe *brother-converts*, diſtinguiſhed by their ſtate from the monks of the choir, who were then either clerks, or capable of becoming ſo.

CONVERTIBILITY *of elements* into one another. See Elements.

Convertibility *of ſpirits* into one another. See Spirits.

CONVERTIBLE Husbandry, in *Agriculture*, is that ſort of farm-management in which the land is cultivated, under the alternate ſyſtems of tillage and graſs.

The lands which are the moſt proper for this kind of huſbandry are thoſe in which the ſoil is of the more dry and friable deſcription, and in which there is a diſpoſition to take on or produce graſs. Wet clayey ſoils are conſidered by Mr. Davis as wholly unfit for this ſort of management. All the loamy ſorts of land which are capable of producing good turnips, and the rich ſandy ſoils, are particularly ſuited to this method of huſbandry. And on many other varieties of land it may be had recourſe to with conſiderable benefit and advantage, where proper care is taken in the cultivation; but it is unqueſtionably a mode of culture which ſtands in need of great attention, in order to conduct it in the moſt proper and beneficial manner, both for the land and the farmer.

It has however been obſerved by Mr. Nairmith, in his "Elements of Agriculture," that "though it were poſſible to make drill culture univerſal, and cultivate the whole country like a garden, it is doubtful if it would be provident. It is to be feared that it would be ſomething like the conduct of a perſon who conſumes part of his capital yearly, along with his annual revenue. Whatever may be ſaid to the contrary, all ſoils certainly ſuffer ſome degree of deterioration by long, unremitted tillage. When diveſted of that cloathing with which nature always defends it if undiſturbed, and when turned up naked to abide the force of the blaſt, the happy medium of conſiſtence is deranged, its beſt particles carried away in torrents; and it is left a feeble ſkeleton, poſſeſſing only the faint ſemblance of departed fertility. This is ſtrongly exemplified, he ſays, in the once fertile iſland of Barbadoes, in the Weſt Indies. It has been ſaid that this iſland, no doubt ſomewhat hyperbolically, ſince it began to be cultivated by the Europeans, has loaded more veſſels with produce than would have been ſufficient to have carried away the whole iſland; and now, it is reported, that the ſoil is ſo exhauſted, that no kind of culture or manure can reſtore its fertility. We have correſpondent accounts from the county of Norfolk, and other diſtricts, where unceaſing tillage has been practiſed: the ſpecies of crop which has been moſt run upon is now leſs productive than formerly. In ſhort, there are numerous inſtances within the perſonal knowledge of many, that wherever the ground has been long dunged and laboured for cropping, without reſt, though the crops may be as bulky, they are generally leſs productive than they were at an earlier period.

“ Convertible huſbandry, or regular alternations of tillage crops and paſtures, ſeem therefore, he ſays, to be the only ſyſtem by which the fertility of the country can be preſerved and improved. The proviſions of a country are not derived from tillage crops alone. A conſiderable proportion is obtained from the dairy and the ſhambles. Contraſts have been made to ſhew the vaſt diſproportion between the quantity of food obtained from any given extent of land in a cultivated crop, and what the ſame extent of paſture yields. But it ſhould be remembered, that the fertility of a cultivated field is often acquired by its having lain in paſture. The quantity of food from cultivated crops is not always in proportion to the extent of the land cultivated. The county of Ayr, in the weſt of Scotland, contains, he ſays, a great deal of good ſoil. It is not much more than forty years ſince he remembers the inhabitants of that county paſſing in crowds with horſes, pack-ſaddles, and empty bags, to the Eaſt, to bring peaſe and barley, of which they made a kind of bread to ſerve them in ſummer. At that time the farmers were under no reſtraint as to the proportion of their farms, which they might have in tillage. Soon after, a gentleman who had the management of a great eſtate in that county, made a regulation in the leaſes, by which the farmers were bound to have never more than a third of their farms in tillage. Other proprietors adopting the ſame regulations, it became general: and the farmers were afterwards reſtricted to plough no more than one fourth. Of late, this county, though not leſs populous than formerly, ſends always a great deal of grain to the neighbouring diſtricts; and inſtead of empty bags and pack-ſaddles, ſends carriages loaded with cheeſe to Leith, to be ſhipped for London. Thus by laying land which has been in tillage, frequently in paſture, the future fertility of the country is enhanced, and its preſent produce is not diminiſhed.

“ But it has been ſtated, he remarks, from high authority, that there is nothing more difficult than to bring old tillage lands to produce good paſture. A perſon who has been in the habit of attending to the culture of the fields, will have ſome difficulty in comprehending this poſition. He will have obſerved, that when the ſeeds of any of the graſſes are permitted to vegetate on land which has been long under tillage culture, they grow with remarkable luxuriancy, if they be not overwhelmed by the growth of weeds in their infancy. If his experience has been of a long ſtanding, he will remember the introduction of clover and rye-graſs into this country, and will recollect that the firſt time theſe ſeeds were ſown on old tillage lands, the crops of graſs were generally more weighty than any that have ſucceeded on the ſame ground. Having found ſuch grounds ſo much diſpoſed to produce graſs, he will be at a loſs to conceive why they ſhould not produce good paſture. As graſs ſeeds vegetate beſt on ground which is of a pretty ſolid conſiſtence, they will ſometimes fail, when the texture is too looſe, unleſs that fault has been remedied by early ploughing, or by ſufficient rolling, or both. But the beſt native *gramina* (graſſes), having numerous fibrous roots, extending horizontally, are not eaſily ejected, after they have gained ſtrength, and become unfailing. In the inſtances which have given riſe to the above poſition, the ground muſt not, he thinks, have been ſtocked with thoſe perennial plants proper to compoſe a good paſture. In a long courſe of tillage, the ſeeds and roots of the native graſſes are worn out and baniſhed: the plants introduced from artificial hay frequently fail in a few years; and the ground is left naked, or ſtocked only with ſuch coarſe weeds as have kept footing in the ground, or had their ſeeds carried there by winds and birds. But to make tillage grounds bear ſtanding paſture, they ſhould be ſtocked with the ſeeds of ſuch indigenous perennial plants as are known to be adapted to that purpoſe.

“ The chief of which are, he ſays, *anthoxanthum odoratum, lolium perenne,* and *alopecurus pratenſis,* for ſpring paſture, to be followed by *cynoſurus criſtatus, poa trivialis,* &c. The leguminous plants for paſturage, he adds, are of the genus *trifolium,* the *pratenſe,* the *repens,* the *lupulinum,* and the *procumbens*; of the genus *vicia,* the *cracca* and *ſepium,* the *lathyrus pratenſis,* &c. If lands which have been long in tillage are ſtocked with the ſeeds of theſe, and care taken not to ſuffer the young plants to be overwhelmed by rank weeds before they get themſelves eſtabliſhed in the ground, all difficulties will be overcome, and ſuch grounds will be found to yield the moſt ſubſtantial and unfailing paſture.

“ As all vegetables are compoſed of the ſame elements, and nouriſhed by the ſame kind of juices, it may appear ſomewhat unphiloſophical, in a ſpeculative view, to maintain that the fertility of the ſoil is preſerved by cultivating one ſpecies of plants upon it one year, or ſeries of years, and plants of a different ſpecies and quality the following.

“ But it is a generally received aphoriſm, he obſerves, that nature delights in variety, and this aphoriſm is ſupported by experience in this as well as in other reſpects. Some kinds of vegetables extend their roots near the ſurface, others penetrate deeper into the ſoil, ſome by overſhadowing the earth with their broad leaves render it ſoft and mellow; others, whoſe naked ſtalks admit the free circulation of the air, conſolidate the ſoil; ſome derive the greateſt part of their nouriſhment from the juices lodged in the earth; others draw a conſiderable proportion from the atmoſphere; ſome, having a longer period of exiſtence, continue long to demand nouriſhment; others arrive more quickly at maturity, and muſt be eaſier ſupported. Beſides, among the various tribes of inſects ſo feeble in themſelves, but ſo formidable and deſtructive by their numbers, each has ſome vegetables which it prefers to others for its food, and reſorts to the places where ſuch food is produced; and as they propagate their kinds where their food is found, they muſt become more numerous, and conſequently more deſtructive, where the cultivation of the ſame plant is often repeated. There are weeds too, he ſays, which bear in this reſpect ſome analogy to thoſe inſects, and as they cannot be at all times fully eradicated, propagate the more, the oftener they meet with the crop moſt agreeable to them. By the effects which the growth of different vegetables produce on the ſoil, the proper medium of conſiſtence is in ſome meaſure preſerved, the vegetable food better huſbanded, and the injuries from noxious inſects and weeds ſomewhat eluded. On all theſe accounts, the maxim of modern agriculturiſts, that crops of a different nature and quality ſhould ſucceed one another, is juſtified.

“ But the arguments in favour of alternations of tillage and paſture, are, he remarks, ſtill more urgent. The derangement of that happy medium between extremes of too great friability and compactneſs, which he has endeavoured to ſhew is eſſential to the general purpoſes of vegetation, is the unavoidable conſequence of long repeated tillage.

“ This is always, he contends, in ſome degree reſtored, when land is left to reſt. If it has been properly treated when in tillage, and well ſtocked with perennial herbage, when left to reſt, it will quickly aſſume a cloſe cover over its ſurface, which, from whatever principle it proceeds, experience has always ſhewn, has a powerful influence in diſpoſing the ſoil to fertility. In this ſtate, the waſhing to which tilſage lands are expoſed in times of rain, is, he ſuppoſes, completely ſuſpended, and the water flows away limpid. While the ground continues covered with a cloſe turf, the root-leaves of the herbage ſpreading over the ſurface, abſorb and digeſt the carbonic acid of the atmoſphere, and perhaps, alſo, earthy particles which probably float continually in the air, as before ſtated. As thoſe leaves are ſmothered and decay, they are perpetually increaſing the ſtock of carbon and vegetable mould. The celebrated Mr. Kirwan, indeed, is, he ſays, of a different opinion. He ſuppoſes, that ground lying in paſture is annually diminiſhing in fertility, though in a leſs degree than that from which a vegetable crop is carried off, becauſe a part is reſtored in the excrements of paſturing animals. But though poor ſoils which are incapable of producing a cloſe turf over their ſurface, gain little by lying at reſt, it is evident, that every ſoil, which either from its natural conformation, or from the improvements made on it by proper culture, has attained a cloſe cover of ſweet herbage, is perpetually gaining. Whenever the temperature is mild, a continual reproduction is taking place; and all the horizontal foliage, which eſcapes the mouths of paſturing animals, falls into decay and accumulates on the ſurface. On breaking up ſuch old paſtures a ſurfaced ſtratum may be obſerved, differing in colour and conformation from that which lies under it, the thickneſs of which is in proportion to the time the ground has lain at reſt. What is here ſtated, is, he thinks, corroborated by the following experiment. Having ſometimes obſerved a kind of turf formed over the hardeſt ſtones in certain ſituations, he collected ſome of it which had grown to more than an inch thick on ſome flat ſtones, lying in a damp place, at the foot of a northerly declivity under ſome trees. It ſeemed to have commenced with the growth of ſome of the ſmaller *muſci* and *algæ*. On this ground the *feſtuca ovina* and *poa glauca* had taken root, and formed a ſtrong turf. After it was dried, he ſubjected a pound of it to combuſtion on an iron ſhovel over a fire till it was reduced to black duſt. The reſidue weighed half an ounce, whereas the greateſt reſidue he ever obtained from a pound of dried peat burnt, was not more than five drams. If ſuch a quantity of mould could thus be accumulated by the graſſes growing on a naked rock, may it not accumulate at leaſt in as great a proportion on the ſoil where the ſucceſſion of growth is incomparably greater?

"It is true, he obſerves, that ſome ſoils by long lying at reſt, condenſe ſo much as to incommode the roots of the graſſes, and on others the moſſes prevail ſo much as to overcome the eſculent herbage, but the fertility of the ſoil is not thereby diminiſhed. Its preſent energy is only ſuſpended, while it is acquiring additional vigour for future exertions. When ſuch land is again employed in tillage, the ſpoils of the turf, together with a great part of what has been conſumed by paſturing animals reſtored in excrements, are turned down and mixed with the ſoil, by which its conformation is improved, and its thickneſs and principle of fertility augmented. Hence the tillage crops are plentiful—the ears large and plump—and the produce of one year equal to two or more on land wearied out by perpetual turning.

"It muſt not be underſtood, by what is here or formerly ſaid, that he means to undervalue the operation of the plough. But, as we are ſtudying in what manner the fertility of the country may be preſerved and improved, and the greateſt quantity of diſpoſable produce obtained at the leaſt poſſible expence, it is neceſſary to examine how all thoſe aids which nature offers may be made to co-operate with the artificial means of agricultural improvement, and not blindly expect from mechanical labour, more than it can poſſibly produce. When barren ſoils are to be brought from a wild ſtate, it is by mechanical labours only that their obſtinacy can be ſubdued, and the different ingredients properly blended. The turf of old graſs ground will frequently require a good deal of mechanical operation to mix it with the earths, and facilitate its putrefaction. But when theſe, and ſuch other aids as mechanical labour is adapted to accompliſh, are obtained, that medium of conſiſtence on which fertility depends will be beſt preſerved by alternate ſucceſſions of labour and reſt. The proportion and order of thoſe ſucceſſions muſt no doubt vary greatly according to circumſtances. While thoſe where the ſoil is deep and of the moſt favourable conſtruction, and where adventitious manure is attainable, may be much occupied in tillage crops, without ſuffering great deterioration; in the more elevated grounds, where the ſoil is generally leſs happily conſtructed, expoſed to ſeverer waſhings and manure leſs abundant, a greater proportion of the farm ought always to be in paſture. But in all ſituations and circumſtances, the ſoil will be benefited by being occaſionally at reſt, provided care has been taken to lay it down unexhauſted, free of weeds, and well ſtocked with proper graſſes. By this ſyſtem of alternations of tillage and graſs crops, the attention of the huſbandman is leſs diſſipated, and his labours more regularly diſtributed. The live ſtock fed on his paſture, furniſh him with manure to enrich his tillage fields, and the more they are enriched, they are the better fitted to yield an abundant return of graſs, when they come in courſe to be laid to reſt. When ground is brought to yield abundance of ſweet graſs it is profitable in paſture, and while it continues ſo is ſtill improving in fertility, and becomes more and more adapted to yield plentiful tillage crops. Thus under good management, the fertility of the country may progreſſively advance, and the diſpoſable quantity of proviſions for the uſe of the conſumer, and the net return to the huſbandman, perhaps, exceed what the operoſe and expenſive ſyſtem of perpetual fallowing, and crops without reſt, could produce.

"Convertible huſbandry is not leſs ſuperior to perpetual graſs. Land which lies perpetually in graſs, is deprived of the advantage of having the vegetable ſubſtance accumulating on the ſurface from time to time mixed into the ſoil. By the working of moles, ants, and other vermin, by the condenſation of the ſoil, by the prevalence of moſſes and uſeleſs weeds, the turf is deformed and the reproduction of ſweet paſture diminiſhed. Water is frequently detained on the ſurface, and chills the growth of eſculent herbage, and thus the growth becomes more feeble and ſlow. In proportion to the decay of eſculent herbage, plants which are noxious or unprofitable prevail; the paſture becomes gradually leſs, and the fertility of the ſoil is almoſt uſeleſs to the owner and to ſociety, while it remains in that ſtate."

The practice of this huſbandry muſt of courſe in many inſtances be highly profitable to the cultivator. See Tillage and Grass.

CONVEX, bending down on every ſide, as the outſide of a globular body.

Convex *freeze*, *leaf*, *lens*, *mirror*, *ſuperficies*. See the ſeveral ſubſtantives.

CONVEXITY, the exterior ſurface of a *convex*, *i. e.* gibbous and globular thing; in oppoſition to *concavity*, or the inner ſurface, when hollow or depreſſed.

The word is of particular import in catoptrics, and dioptrics; where it is applied to *mirrors* and *lenſes*; which ſee. See alſo Refraction.

CONVEYANCE, in *Law*, a deed, or inſtrument, by which lands, &c. are *conveyed*, or transferred, by the proprietor, to ſome other perſon. In the diſcuſſion of this ſubject, it is proper to inquire *who* may thus aliene and to *whom*; and then *how* a man may aliene, or the ſeveral modes of conveyance. With regard to the firſt inquiry, who is capable of conveying and who of purchaſing, the ſubject of conſideration is rather the incapacity, than the capacity, of the ſeveral parties; for all perſons in *poſſeſſion* are *primâ facie* capable both of conveying and purchaſing, unleſs the law hath laid them under any particular diſabilities. But if a man has only in him the *right* of either poſſeſſion or property, he cannot convey it to any other, leſt pretended titles might be granted to great men, by which juſtice might be trodden down, and the weak oppreſſed. (Co. Litt. 214.) Yet reverſions and veſted remainders may be granted, becauſe the poſſeſſion of the particular tenant is the poſſeſſion of him in reverſion or remainder; but *contingencies*, and mere *poſſibilities*, though they may be releaſed, or deviſed by will, or may paſs to the heir or executor, cannot be aſſigned to a ſtranger, unleſs coupled with ſome preſent intereſt. (Sheppard's Touchſtone, 238, 239. 322. 11 Mod. 152. 1 P. Wms. 574. Stra. 132.)

Perſons attainted of treaſon, felony, and præmunire, are incapable of conveying, from the time of the offence committed, provided attainder follows, for ſuch conveyance by them may tend to defeat the king of his forfeiture, or the lord of his eſcheat. But they may *purchaſe* for the benefit of the crown, or the lord of the fee, though they are diſabled to *hold* the lands ſo purchaſed, if after attainder, being ſubject to immediate forfeiture; if before, to eſcheat as well as forfeiture, according to the nature of the crime. (Co. Litt. 42. 2.) Thus alſo corporations, religious or others, may purchaſe lands: yet, unleſs they have a licence to hold in mortmain, they cannot retain ſuch purchaſe; but it ſhall be forfeited to the lord of the fee. Idiots and perſons of non-ſane memory, infants, and perſons under dureſs, are not totally diſabled either to convey or purchaſe, but *ſub modo* only. For their conveyances and purchaſes are voidable, but not actually void. The king indeed, on behalf of an idiot, may avoid his grants or other acts. (Co. Litt. 247.) See Idiot. A feme-covert may *purchaſe* an eſtate without the conſent of her huſband, and the conveyance is good during the coverture, till he avoids it by ſome act declaring his diſſent. And though he does nothing to avoid it, or even if he actually conſents, the feme-covert herſelf may, after the death of her huſband, waive or diſagree to the ſame; nay, even her heirs may waive it after her, if ſhe dies before her huſband, or if in her widowhood ſhe does nothing to expreſs her conſent or agreement. (Co. Litt. 3.) But the conveyance or other contract of a feme-covert (except by ſome matter of record) is abſolutely void, and not merely voidable (Perkins, § 154. 1 Sid. 120.); and therefore cannot be affirmed or made good by any ſubſequent agreement. The caſe of an alien born is alſo peculiar.—For he may purchaſe any thing; but after purchaſe he can hold nothing, except a leaſe for years of a houſe for convenience of merchandize, if he be an alien-friend: all other purchaſes (when found by an inqueſt of office) being immediately forfeited to the king (Co. Litt. 2.). Papiſts, and perſons profeſſing the popiſh religion, and neglecting to take the oath preſcribed by ſtatute 18 Geo. III. c. 60. within the time limited for that purpoſe, are by ſtat. 11 and 12 W. III. c. 4. diſabled from purchaſing any lands, rents, or hereditaments; and all eſtates made to their uſe, or in truſt for them, are void. (1 P. Wms. 354.)

In anſwer to the ſecond inquiry, or *how* a man may aliene or convey, we are led to ſtate the ſeveral modes of conveyance. A tranſlation, or transfer, of property being admitted by law, it became neceſſary that this transfer ſhould be properly evidenced, in order to prevent diſputes as to the fact, or in relation to the perſons concerned, or with regard to the ſubject-matter, or with reſpect to the mode and quality of the transfer. The legal evidences of this tranſlation of property are called the *common aſſurances* of the kingdom. See *Common* Assurances.

Deeds (ſee Deed) which ſerve to convey the property of lands and tenements from man to man, are commonly denominated *conveyances*; and theſe are either conveyances at *common law*, or ſuch as receive their force and efficacy by virtue of the *ſtatute of uſes*. Of conveyances by the common law, ſome may be called *original* or *primary* conveyances; which are thoſe by means of which the benefit or eſtate is created or firſt ariſes; and others are *derivative* or *ſecondary*, by which the benefit or eſtate, originally created, is enlarged, reſtrained, transferred, or extinguiſhed. *Original* conveyances are the following, *viz. Feoffment, Gift, Grant, Leaſe, Exchange*, and *Partition;* which ſee reſpectively. *Derivative* conveyances are *Releaſe, Confirmation, Surrender, Aſſignment*, and *Defeazance;* which ſee under their proper titles. For other conveyances, which have their force and operation by virtue of the *ſtatute of uſes*, which have been derived from it or introduced in conſequence of it; ſee Uses. See alſo Covenant *to ſtand ſeiſed to uſes*, Bargain *and* Sale, Lease *and* Release, and Revocation *of Uſes*.

A conveyance cannot be fraudulent in part, and good as to the reſt: for if it be fraudulent and void in part, it is void in all; and it cannot be divided. 1 Lill. Abr. 311. Fraudulent conveyances to deceive creditors, defraud purchaſers, &c. are void, by ſtatutes 13 Eliz. c. 5. 27 Eliz. c. 4. See Fraud.

CONVICT, in *Common Law*, one who is found guilty of an offence, by the verdict of a jury. This conviction may accrue two ways; either by his confeſſing the offence and pleading guilty; or by his being found ſo by the verdict of his country. Judge Blackſtone ſays, that in the Roman republic, when the priſoner was convicted of any capital offence by his judges, the form of pronouncing that conviction was peculiarly delicate, not that he was guilty, but that he had not been ſufficiently on his guard, "parum caviſſe videtur."

According to Crompton, a perſon is alſo a convict, or ſaid to be convicted, when, after having been outlawed, he appears and confeſſes, or is found guilty by the inqueſt; and he ſays, moreover, that when a ſtatute excludes from clergy perſons found guilty of felony, &c. it extends to thoſe who are convicted by confeſſion. (Cromp. Inſt. 9.)

The law implies that there muſt be a conviction before puniſhment, though it is not ſo mentioned in a ſtatute; and where any ſtatute makes a ſecond offence felony, or ſubject to a heavier puniſhment than the firſt, it is always implied that ſuch ſecond offence ought to be committed after a conviction for the firſt. (1 Hawk. P. C. c. 10. § 9. c. 41. § 3.) Judgment amounts to conviction; though it doth not follow that every one who is convicted is adjudged. A conviction at the king's ſuit may be pleaded to a ſuit by an informer, on a penal ſtatute; becauſe while in force it makes the party liable to the forfeiture, and no one ought to be puniſhed twice for the ſame offence; but conviction may be pleaded to a new ſuit by the king. (1 Hawk. P. C. c. 10.) A perſon convicted or attainted of one felony may be proſecuted for another, to bring acceſſaries to puniſhment, &c. (Fitz. Coron. 379.)

Perſons convicted of felony by verdict, &c. are not to be admitted to bail, unleſs there be ſome ſpecial motive for granting it; as where a man is not the ſame perſon, &c. for bail ought to be before trial, when it ſtands indifferent whether the party be guilty or not. (2 Hawk. P. C. c. 15. § 43, 80.) See Bail. Conviction of felony, and other crimes, diſables a man to be a juror, witneſs, &c. Conviction and attainder, &c. are, in our law-books, frequently confounded. On conviction, (or even upon an acquittal when there was reaſonable ground to proſecute, and, in fact, a *bona fide* proſecution,) for any grand or petit larceny, or other felony, the reaſonable expences of proſecution, and alſo, if the proſecutor be poor, a compenſation for his trouble and loſs of time, are by ſtatutes 25 Geo. II. c. 36., and 18 Geo. III. c. 19. to be allowed him out of the county ſtock, if he petitions the judge for that purpoſe; and by ſtatutes 27 Geo. II. c. 3. explained by the ſame ſtatute 18 Geo. III. c. 19; all perſons, appearing upon recognizance or *ſubpœna* to give evidence, whether any indictment be preferred or not, and as well without conviction as with it, are entitled to be paid their charges, with a farther allowance (if poor) for their trouble and loſs of time. Moreover, on a conviction of larceny in particular, the proſecutor ſhall have reſtitution of his goods, by virtue of the ſtatute 21 Hen. VIII. c. 11. And the conſtruction of this act having been in great meaſure conformable to the law of appeals, it has therefore in practice ſuperſeded the uſe of appeals of larceny. It is now uſual for the court, upon the conviction of a felon, to order (without any writ of reſtitution) immediate reſtitution of ſuch goods as are brought into court to be made to the ſeveral proſecutors, or elſe, without ſuch writ, the party may peaceably retake his goods, wherever he happens to find them, unleſs a new property be fairly acquired in them. Or, if the felon be convicted and pardoned, or be allowed his clergy, the party robbed may bring his action of trover againſt him for his goods, and recover a ſatisfaction in damages. But ſuch action does not lie before proſecution; for then felonies would be made up and healed (1 Hal. P. C. 546.): and alſo recaption is unlawful, if it be done with intention to ſmother or compound the larceny; it then becoming the heinous offence of *theft-bote;* which ſee.

When a perſon is convicted of a miſdemeſnor which principally and more immediately affects ſome individual, as a battery, impriſonment, or the like, it is not uncommon for the court to permit the defendant to *ſpeak with the proſecutor,* before any judgment is pronounced; and if the proſecutor declares himſelf ſatisfied, to inflict but a trivial puniſhment. This is done, to reimburſe the proſecutor his expences, and make him ſome private amends, without the trouble and circuity of a civil action. This, ſays judge Blackſtone, is a dangerous practice, which, though intruſted to the diſcretion of the judges in the ſuperior courts of record, ought never to be allowed in local or inferior juriſdictions, ſuch as the quarter-ſeſſions; where proſecutions for aſſaults are by ſuch means too frequently commenced, rather for private lucre than for the great ends of public juſtice. Above all, he ſays, it ſhould never be ſuffered, where the teſtimony of the proſecutor himſelf is neceſſary to convict the defendant; for there the rules of evidence are entirely ſubverted; the proſecutor becomes in effect a plaintiff, and yet is ſuffered to bear witneſs for himſelf. Nay, even a voluntary forgiveneſs, by the party injured, ought not, in true policy, to intercept the ſtroke of juſtice. "This," ſays an elegant writer (Beccaria, ch. 46.) who pleads with equal ſtrength for the *certainty* as for the *lenity* of puniſhment, "may be an act of good nature and humanity, but it is contrary to the good of the public. For, although a private citizen may diſpenſe with ſatisfaction for his private injury, he cannot remove the neceſſity of public example. The right of puniſhing belongs not to any one individual in particular, but to the ſociety in general, or the ſovereign who repreſents that ſociety; and a man may renounce his own portion of this right, but he cannot give up that of others." Blackſt. Comm. Book iv.

Convict *recuſant,* he who has been legally preſented, indicted, and convicted, for refuſing to come to church to hear the common prayer, according to the ſtatutes 35 Eliz. and 3 Jac. I.

This is commonly underſtood to be a popiſh recuſant; though any others who refuſe coming to church on the ſame account are as properly denominated recuſants.

CONVICTION, in *Law.* See Convict.

Conviction, in *Theology,* expreſſes the firſt degree of repentance; wherein the ſinner becomes ſenſible of his guilt, of the evil nature of ſin, and of the danger of his own ways.

Conviction, *ſummary,* in *Law,* is ſuch as is directed by ſeveral acts of parliament, for inflicting certain penalties created by thoſe acts, without the intervention of a jury: the party accuſed being acquitted or condemned by the ſuffrage of ſuch perſon only, as the ſtatute has appointed to be his judge. Of this kind are all trials of offences contrary to the laws of Excise, and other branches of the Revenue, proceedings before Justices *of the peace,* and the method uſed by ſuperior courts of juſtice for puniſhing contempt by attachment. See Contempt.

CONVIVIUM, *banquet,* in our *Ancient Cuſtoms,* and *Law-Books,* ſignifies the ſame thing among the laity as procuration among the clergy; *viz.* when the tenant was obliged, in virtue of his tenure, to provide meat and drink for his lord once, or oftener, in the year.

Convivium *militare,* a military banquet or repaſt. The repaſt of Roman ſoldiers was a particular object of military diſcipline, which the commanders themſelves paid attention to. The ſoldiers were not ſuffered to eat alone but by troops, in order to preſerve union and good fellowſhip amongſt them.

CONULI, in *Natural Hiſtory,* *Conuli* Kleinii, a claſs of the *Echinus,* in the Molluſca order of Vermes. See Echinus.

CONULUS, a genus of the *Trochus,* in the Teſtacea order of Vermes. See Trochus.

CONVOCATION, a general aſſembly of the repreſentatives of the clergy of a province, ſummoned by the king's writ to conſult of the more weighty affairs of the church, as oft as a parliament is convoked to conſult of thoſe of the ſtate.

The king's writ is directed to the archbiſhop of each province, requiring him to ſummon all biſhops, deans, archdeacons, cathedral and collegiate churches, &c.

Upon which, the archbiſhop directs his mandate to his dean provincial, firſt citing him peremptorily; then willing him, in like manner, to cite all the biſhops, deans, &c. and all the clergy of his province: but directing, withal, that one proctor ſent for each cathedral and collegiate church, and two for the body of the inferior clergy of each dioceſe, may ſuffice: which the dean accordingly does.

The place where the convocation of the province of Canterbury has been uſually held, is St. Paul's church; whence they have been prorogued to St. Peter's in Weſtminſter, in the chapel of Henry VII. or the Jeruſalem Chamber, where there is an upper and lower houſe.

The *upper* houſe, in the province of Canterbury, conſiſts of twenty-two biſhops, whereof the archbiſhop is always preſident, who prorogues and diſſolves the convocation by mandate from the king: and before the reformation abbots, priors, and other mitred prelates ſat with the biſhops. All, at the opening of a convocation, are in their ſcarlet robes and hoods.

The *lower* houſe conſiſts of twenty-two deans, fifty-four archdeacons, twenty-four proctors for the chapters, and forty-four proctors, repreſenting the parochial clergy; in all 144.

Each houſe hath a prolocutor choſen from among themſelves; and that of the lower houſe is preſented to the biſhops. Things are firſt uſually propoſed in the upper houſe; then communicated to the lower. All the members of both houſes have the ſame privilege in freedom from arreſt, as the members of parliament have, ſtat 8 Hen. VI. c. 1. and the proctors of the clergy received wages from their conſtituents.

The convocation exerciſes juriſdiction in making canons with the king's aſſent, (ſtat. 25 Hen. VIII. c. 19.) This ſtatute which reſtrains the convocation from making or executing any canons repugnant to the king's prerogative, or the laws, cuſtoms, and ſtatutes of the realm, was merely declaratory of the old common law (12 Rep. 72.); that part of it only being new, which makes the king's royal aſſent actually neceſſary to the validity of every canon. To the convocation alſo belong the examination and cenſure of heretical and ſchiſmatical books and perſons. But appeal lies from their proceedings to the king in chancery, or to his delegates. In caſe the king himſelf be a party, the appeal lies by ſtat. 24 Hen. VIII. c. 12. to all the biſhops aſſembled in the upper houſe of convocation. See COURT *of delegates*.

The archbiſhop of York, at the ſame time, holds a convocation of the clergy of his province, after the like manner at York; and, by conſtant correſpondence, debates and concludes of the ſame matters as are debated by that of Canterbury; but they are diſtinct and independent of each other; and when they uſed to tax the clergy, they granted different ſubſidies. In the province of York, the convocation conſiſts only of one houſe; and on account of the ſmall number of dioceſes in this province, each archdeaconry elects two proctors. It has been cuſtomary with the convocation, for many years back, regularly to aſſemble, and to adjourn without proceeding to any buſineſs; ſo that the convocation now exiſts more in form than for any effective purpoſe. See CHURCH *of England*.

In the year 1711, the convocation was aſſembled with the new parliament; the lower houſe choſe Atterbury for its prolocutor; and both houſes concurred in cenſuring ſome tenets that favoured Arianiſm, broached and ſupported by Mr. Whiſton, mathematical profeſſor in Cambridge. The archbiſhop doubted whether this aſſembly could proceed againſt a man for hereſy; the judges were conſulted, and the majority gave their opinion that the convocation had a juriſdiction. Five of them profeſſed the contrary ſentiment, which they maintained from the ſtatutes made at the reformation; the queen, not doubting their juriſdiction, expected them to proceed, but freſh ſcruples ariſing, they determined to examine the book, without proceeding againſt the author, and this was cenſured accordingly. An extract of the ſentence was ſent to the queen, but ſhe did not ſignify her pleaſure on this ſubject, and the affair remained in ſuſpence. Before the queen's death, in 1714, the lower houſe of convocation had declared, that a book publiſhed by Dr. Samuel Clarke, under the title of "The Scripture Doctrine of the Trinity," contained aſſertions contrary to the Catholic faith. They ſent up extracts from this performance to the biſhops; and the doctor wrote an anſwer to their objections. He was prevailed upon to write an apology, which he preſented to the upper houſe; but apprehending that it might be publiſhed ſeparately, and miſunderſtood, he afterwards delivered an explanation to the biſhop of London. This was ſatisfactory to the biſhops; but the lower houſe reſolved, that it was no recantation of his heretical aſſertions. (See the article CLARKE.) In the year 1717, the proceedings in the convocation turned chiefly upon two performances of Dr. Hoadly, biſhop of Bangor. One was entitled "A Preſervative againſt the principles and practices of the Non-jurors;" the other was a ſermon preached before the king, under the title of "The nature of the kingdom of Chriſt;" the convocation appointed a committee to examine the biſhop's two performances; and thus commenced the famous controverſy, called "Bangorian;" in conſequence of a letter written on the ſubject of the biſhop's diſcourſe by Dr. Snape, maſter of Eton college. The convocation drew up a repreſentation, in which the preſervative and the ſermon were cenſured, as tending to ſubvert all government and diſcipline in the church of Chriſt; to reduce his kingdom to a ſtate of anarchy and confuſion; to impugn and impeach the royal ſupremacy in cauſes eccleſiaſtical, and the authority of the legiſlature to enforce obedience in matters of religion by civil ſanctions. Before this repreſentation could be brought into the upper houſe, that whole aſſembly was prorogued by a ſpecial order from the king. This meaſure, however, inflamed the controverſy. A great number of pens were drawn againſt the biſhop; but his chief antagoniſts were Dr. Snape, and Dr. Sherlock, whom the king removed from the office of his chaplains. The convocation has not been permitted by government to do any buſineſs of conſequence ſince this time, but merely to confine itſelf to matters of form. See CHURCH *of England*.

The Engliſh clergy, anciently, had their repreſentatives in the lower houſe of parliament; as appears by the record, much prized by lord Coke. Among the freeholders who were preſent in parliamentary meetings, we find many of the inferior, ſecular, clergy; an order of men who were, certainly, of too great eſtimation and account in the ſtate not to have had a ſhare in the legiſlature, either perſonally or by repreſentatives. There are not, indeed, any writs of ſummons now remaining, which require proctors to be ſent for them to the parliaments of this kingdom, before the 23d year of Edward I.; but from the annals of Burton (p. 355, ſub anno 1255.) it appears, that the whole body of the clergy were ſo repreſented in the 39th of Henry III. Nor is this remarked as a novelty by any of the hiſtorians who wrote in that age; though, being all eccleſiaſtics, they would probably have thought it more worthy of obſervation than any event in which the laity alone were concerned. It may be therefore preſumed, that, not only the attendance of the inferior clergy in parliament, which is evidently proved by many paſſages in more ancient hiſtorians, but this kind of repreſentation of them had been cuſtomary long before. (See BOROUGH.) In later times, from a deſire of independence on the ſtate, to which they were incited more and more by the pope, they gradually withdrew themſelves from any attendance in parliament, either perſonally, or by repreſentatives; ſo that, after the reign of Henry VI., they are hardly ever mentioned as preſent there; although in the 21ſt year of Richard II. the commons had ſhewn in a petition to the king, "how that before thoſe times many judgments and ordinances, made in the times of the progenitors of our lord the king in parliament, had been repealed and diſannulled, becauſe the ſtate of the clergy were not preſent in parliament at the making of the ſaid judgments and ordinances." After the reformation of religion, in the reign of Edward VI., an attempt was made in convocation to have the lower houſe united to the houſe of commons, "according to ancient cuſtom, *ſicut ab antiquo fieri conſuevit*." It was alſo propoſed to queen Elizabeth, but rejected. The clergy continued to tax themſelves in a ſeparate body, till the reſtoration of Charles II.; ſoon after which they were taxed in the ſame manner and conjointly with the reſt of the commons; and have ever ſince been repreſented in parliament by the ſame perſons, which has more *embodied* them with the laity, and prevents the ſetting up of a church intereſt diſtinct from that of the people. It is remarkable, that this very important alteration in the ſtate of the kingdom was made *without any law*, by agreement with the clergy. (Littleton's Hiſt. Hen. II. vol. iii.)

In the parliament of Ireland, originally formed on the model of that of England, the clergy continued to be members of the houſe of commons, till they were excluded by an act of parliament, 28 Hen. VIII. A. D. 1536, becauſe they ſupported the authority of the pope, and obſtructed the reformation of the church. Whilſt the clergy continued to grant their own money in their convocations, their grants were not effectual till they were confirmed in parliament. In the 15th century the clergy of England had great influence in all the public councils of the kingdom, and particularly in parliament: they conſtantly reſided in the kingdom, and were preſent in theſe councils; while the nobles and great men were engaged in warlike expeditions into France or Scotland. Beſides all the archbiſhops and biſhops, twenty-five abbots and two priors were ſummoned to every parliament, and ſometimes many more; ſo that the ſpiritual lords were generally double the number of the temporal lords in the houſe of peers. (Pryrne's regiſter of writs, vol. i. & iv.) This enabled the prelates to procure ſanguinary laws againſt heretics, and to ſecure the immenſe poſſeſſions of the church, together with all her abſurd errors and wretched ſuperſtitions, from all attacks. 1 Hen. IV. c. 15. 2 Hen. V. c. 7.

CONVOLVULI, in *Botany*, the tenth natural order of dicotyledonous hypogynous plants, in the ſyſtem of Juſſieu, with the following character. *Calyx* five-cleft, moſt frequently permanent. *Corolla* regular, commonly with a five-cleft border. *Stamens* generally five, inſerted at the baſe of the corolla, and alternating with its ſegments. *Style* one, or definitely divided; when one, with a ſtigma either ſimple or divided; when more than one, with as many ſimple ſtigmas as there are diviſions. *Fruit* capſular, often three-celled, more rarely two or four-celled; cells with one or more ſeeds. *Seeds* marked with an umbilical eye at the baſe, ſomewhat oſſeous, and affixed below to the central partition; valves free, with their edges adjoining to the angles of the partition; radicle of the arched corculum inferior. (Corculum ſhut up by the periſperm?) *Stems* ſhrubby, or more frequently herbaceous; many twining; many lacteſcent. *Leaves* alternate, very rarely almoſt oppoſite, (always ſimple, Vent.). This order is nearly allied to the Borragineæ and Polemonia, in its regular five-cleft pentandrous corolla, and alternate leaves; but differs from the latter, in having the partition adjoining to the edges, not to the middle of the valves; and from the former, in the fruit not being gymnoſpermous. Juſſieu aſſigns to it the following genera: 1. With a ſingle ſtyle. Maripa, Aubl.; mouroucoa, Aubl.; retzia, Thunb.; endrachium, (humbertia, Commers.); convolvulus, Linn.; ipomæa, Linn. 2. With ſeveral ſtyles. Evolvulus, Linn.; nama, Brown and Linn.; hydrolea, Linn.; ſagonea, Aubl.; creſſa, Linn. 3. Allied to the convolvuli. Cuſcuta, Linn.; diapenſia, Linn.; loeſelia, Linn.

Ventenat has changed the name of the order to convolvulaceæ, and has included in it only convolvulus, ipomæa, evolvulus, and creſſa; entirely omitting marupa, mouroucoa, retzia, endrachium, nama, hydrolea, and ſagonea; and removing cuſcuta to his undetermined plants, and diapenſia and loeſelia to the polemonia, his polemonaceæ. La Marck's natural family of liſerons correſponds exactly with the firſt two ſections of Juſſieu.

CONVOLVULUS, (ſo called, *a convolvendo*, becauſe many of the ſpecies are twining). Linn. Gen. 215. Schreb. 287. Willd. 323. Lam. Illuſt. 296. Gært. 780. Juſſ. 133. Vent. ii. 396. Claſs and order, *pentandria monogynia*. Nat. Ord. *Campanaceæ*, Linn. *Convolvuli*, Juſſ. *Convolvulaceæ*, Vent.

Gen. Ch. *Cal.* perianth five-cleft. *Cor.* monopetalous, bell-ſhaped or funnel-ſhaped, plaited; border generally ſpreading, more or leſs five-lobed. *Stam.* filaments five, awl-ſhaped, ſhorter than the corolla, approximating at the baſe. *Piſt.* germ ſuperior, roundiſh; ſtyle filiform; ſtigma ſimple or bifid. *Peric.* capſule ſurrounded by the calyx, roundiſh; one, two, three, or four-celled; one, two, three, four, or many-valved. *Seeds* one or two in each cell.

Eſſ. Ch. Five-cleft. Corolla bell or funnel-ſhaped. Stigmas one or two. Pericarp a capſule, or dry berry. Seeds one or two in each cell.

Obſ. Authors often call the calyx five-leaved, when it is very deeply five-cleft.

* *Stems twining.*

Sp. 1. C. *arvenſis.* Linn. 1. Mart. 1. Deſrouſſeaux, Encyc. 2. Lam. Ill. 2001. Willd. 1. Bauh. Pin. 294. Flor. Dan. tab. 459. Curt. Flor. Lond. 2. 13. Eng. Bot. 312. (C. minor; Bauh. Hiſt. 2. 157. C. purpureus; Lob. Obſ. 340. fig. 2. C. minor arvenſis, flore roſeo; Tourn. Inſt. 83. Smilax levis minor; Ger. Emen. 861. Helxine foliis ſagittatis, ciſſampelos; Mat. 1011. Camer. Epit. 753.) "Leaves arrow-ſhaped; lobes acute; flowers generally ſolitary; bractes minute, awl-ſhaped, remote from the flower." *Root* perennial, creeping, ſtriking deeply into the ground, not eaſily extirpated. *Stems* numerous, angular. *Leaves* alternate, petioled, ſmoothiſh. *Flowers* fleſh-coloured, ſometimes white, ſweet-ſcented, opening only in clear weather; peduncles axillary, generally one-flowered, thickened above. A troubleſome weed in cultivated ground, twining cloſely about the culms of wheat, and other kinds of corn, and thence in many parts of England called bind-weed. Its juice is ſlightly purgative. The bloſſoms give a deep yellow or orange tincture to water, which is heightened by alum and alkalis. A native of Great Britain, and moſt parts of Europe. 2. C. *auriculatus*. Deſr. 3. Lam. 2002. (C. arvenſis β; Linn. C. minimus, anguſto auriculato folio; Bocc. Muſ. tab. 33. Pluk. Alm. 116. tab. 24. fig. 3. C. arvenſis minimus; Rai. Syn. 276.) "Leaves linear, haſtate-acuminate; lobes entire." Diſtinguiſhed from the preceding by its narrow elongated leaves, longer petals, and bractes placed nearer the flower. A native of Great Britain, and other parts of Europe: found by Commerſon in the Iſle of France, where it is ſuppoſed to have been brought with wheat from Perſia. 3. C. *ſepium*. Linn. 2. Mart. 2. Deſr. 1. Lam. 1. Willd. 2. Flor. Dan. tab. 458. Curt. Flor. Lond. 1. tab. 13. Eng. Bot. 313. (C. major, albus; Bauh. Pin. 294. Tourn. Inſt. 82. Smilax lœvis major; Ger. Emen. 861.) "Leaves arrow-ſhaped; lobes truncate; peduncles ſquare, one-flowered; bractes larger than the calyx, and cloſe to it." β americanus; with a fleſh-coloured flower. Bot. Mag. 732. *Root* perennial, about the thickneſs of a gooſe-quill, white, creeping, not eaſily eradicated. *Stems* numerous, from ſix to ten inches high, or more, angular, ſmooth, not much branched. *Leaves* alternate, petioled, dependent. *Flowers* large, generally white, ſometimes fleſh-coloured; nectary a yellow gland, ſurrounding the baſe of the germ. A native of Great

Britain, and moſt parts of Europe, climbing up hedges in moiſt ground. Its inſpiſſated juice, taken in doſes of twenty or thirty grains, is a powerful purgative. 4. C. *Wheeleri.* Mart. 84. Willd. 3. Vahl. Symb. 2. 366. (C. ſagittariæ foliis, Wheeleri; Pluk. Phyt. tab. 85. fig. 3. Ipomæa ſagittata; Poir. It. 2. 160. tab. 3.) "Leaves arrow-ſhaped, roundiſh behind, entire; peduncles cylindrical, one-flowered." Wholly ſmooth. *Leaves* acute; petiole the length of the leaf. *Peduncles* ſhorter than the petiole, thicker, bractate towards the middle, thicker under the flower. Allied to C. ſepium. A native of Spain and Barbary. 5. C. *ſcammonia.* Linn. 3. Mart. 3. Deſr. 81. Lam. 2079. Woodv. Med. Bot. 13. tab. 5. (C. ſyriacus, ſive ſcammonia; Moriſ. Hiſt. 2. 12. tab. 3. fig. 5. Bauh. Pin. 294.) "Leaves triangular-arrow-ſhaped; peduncles cylindrical, nearly double the length of the leaves, about three-flowered." *Root* perennial, long, thick, fleſhy, full of a milky juice. *Stems* cylindrical, ſlender, ſomewhat villous. *Leaves* alternate ſmooth, acute; poſterior lobes diverging, with a tooth on the inner ſide of each. *Flowers* large, purpliſh white or pale yellow; peduncles ſolitary; ſegments of the calyx emarginate; bractes ſmall, awl-ſhaped, ſpreading, remote from the flower. *Capſule* three or four-celled. A native of Syria and Aſia Minor. For its medical uſes, ſee SCAMMONY. 6. C. *involucratus.* Willd. 5. "Leaves cordate-haſtate, pubeſcent; peduncles about three-flowered; calyxes bracteate." *Stem* cylindrical, pubeſcent-villous. *Leaves* oblong, obtuſe, mucronate, quite entire, pubeſcent on both ſides; truncate at the baſe, undivided, rather obtuſe; petioles villous. *Peduncles* about the length of the leaves, pubeſcent. *Bractes* two at the diviſion of the peduncle, pubeſcent, oblong, acute; two others at the baſe of each flower, villous-pubeſcent, elliptical, rather acute, longer than the calyx, and involving it. A native of Guinea. 7. C. *ſagittifolius.* Smith Prod. Fl. Gr. p. 133. Flor. Græc. tab. 193. "Leaves cordate-haſtate, covered with long diſtinct hairs, angular at the baſe; peduncles generally one-flowered; capſules hirſute." A native of the iſlands in the Archipelago, in vineyards and cultivated ground. 8. C. *ſibiricus.* Linn. Mantis. 203. Mart. 4. Deſr. 80. Lam. 2078. Willd. 6. (C. rupeſtris; Pallas It. 3. n. 80. tab. K.) "Leaves cordate-acuminate, even-ſurfaced; peduncles two-flowered; ſtipules retuſe, decurrent." *Root* annual. *Stems* from four to ſix feet long, ſlender, ſlightly winged from the decurrence of the ſtipules, but not two-edged. *Leaves* ending in a point, which extends to half their whole length, ſoft, thin, ſmooth, veined, entire, paler underneath; ſtipules vertical, ſmall, obtuſe. *Flowers* ſmall, ſcarcely twice the length of the calyx, whitiſh or fleſh-coloured, fugacious; bractes often wanting; when preſent, briſtle-ſhaped, ſometimes at the diviſion of the peduncle, ſometimes on the pedicels; calyx ſmooth, deeply divided; ſtigma capitate, two-lobed. A native of Siberia, floweringin July and Aug. Introduced into England in 1779. 9. C. *rupeſtris.* Willd. 7. "Leaves obtuſely heart-ſhaped, oblong, lanceolate, acute; peduncles one-flowered." *Stem* ſmooth, but little twining, ſomewhat ſhrubby. *Leaves* two inches long, ſmooth, ſlightly hairy underneath, and at the edges, when viewed through a lens. *Flowers* violet; peduncles almoſt the length of the leaves; bractes two, awl-ſhaped, about the middle of the peduncle; calyx-leaflets, egg-ſhaped, acute, a little hairy; corolla flat, five-plaited; plaits a little hairy on the outſide. Suppoſed to be a native of Siberia. 10. C. *farinoſus.* Linn. Mant. 203. Mart. 5. Deſr. 79. Lam. 2077. Wild. 8. Jacq. Hort. Vind. 1. 13. tab. 35. Saliſb. Par. Lond. 45. "Leaves heart-ſhaped, acuminate, repand; peduncles three-flowered; ſtem mealy." Linn. "Stem with a ſilky pubeſcence, which appears at a little diſtance like duſt; leaves cordate, arrow-ſhaped, with the baſe of the ſinus prominent, repand-toothed, ſmooth above: panicles from three to ſeven-flowered; border of the corolla ſharply five-cleft; ſtigmas ſmooth." Saliſb. *Root* annual. *Stem* ſix feet high, about the thickneſs of a gooſe-quill. *Leaves* remote, but from the number of branches appearing crowded. *Flowers* pale roſe-coloured; peduncles longer than the leaves, ſlender, cylindrical; pedicels turned upward after flowering; bractes ſmall, tinged with dull purple towards the top; ſegments of the calyx purpliſh, mucronate; tube of the corolla pale green, funnel-ſhaped, pentangular, ſhining; filaments whitiſh, attached to the tube nearly its whole length, ſlightly pubeſcent; anthers pale blue. *Nectary* deep yellow. *Capſule* two-celled, two ſeeds in each cell. Saliſb. Four-celled, one ſeed in each cell. Jacq. A native of fields and hedges in Myſia, Livadia, and Peloponneſus; Sibth. Madeira; Maſſon. 11. C. *lanuginoſus.* Mart. 85. Willd. 9. Vahl. Symb. 3. 23. "Leaves heart-ſhaped, oblong, ſomewhat haſtate, tomentous-ſilky, auricled, toothed; peduncles three-flowered; ſtem hairy." *Stem* herbaceous, beſet with numerous ferruginous hairs. *Leaves* on ſhort peduncles, acute; auricles with two teeth. *Flowers* reſembling thoſe of ſcammony, yellowiſh, having a purpliſh lanceolate line, with a pile of yellow hairs on each ſegment of the border; bractes two at the diviſion of the peduncle, lanceolate; two others on each lateral pedicel near the flower; middle pedicel ſhorter, without bractes; peduncles axillary, ſolitary, hairy; three outer leaflets of the calyx egg-ſhaped, acuminate, rough with hairs; ſtyle bifid. Suppoſed to be a native of the Levant. 12. C. *incanus.* Mart. 86. Willd. 10. Vahl. Symb. 3. 23. "Tomentous-ſilky; leaves lanceolate-arrow-ſhaped, obtuſe, often with two teeth at the baſe; peduncles two-flowered." *Stem* herbaceous, cylindrical. *Leaves* an inch and half long, rounded at the end, mucronate, gradually wider towards the baſe; auricles rounded behind; petioles one fourth of the length of the leaf. *Peduncles* the length of the leaves; pedicels one ſhorter and thicker, with two bractes at the baſe; one longer, with two briſtle-ſhaped bractes in the middle; ſegments of the calyx egg-ſhaped, acute; outer ones more villous; corolla villous on the outſide; ſtyle bifid. *Capſule* ſmooth, globular. A native of America. 13. C. *ſalicifolius.* Deſr. 17. Lam. 2016. "Leaves lanceolate, ſerrated, on ſhort petioles; calyx angular." *Stems* cylindrical, ſlender. *Leaves* three or four inches long, narrowed to a point at both extremities. *Peduncles* ſhorter than the leaves, axillary, ſolitary, one-flowered; bractes two, very ſmall, awl-ſhaped, at a diſtance from the flower; calyxes five-leaved. A native of St. Domingo; ſpecimen in the herbarium of La Marck. 14. C. *emarginatus.* Mart. 87. Willd. 11. Vahl. Symb. 3. 23. (C. uniflorus; Deſr. 18. Lam. 2017. Burm. Ind. 47. tab. 21. fig. 2.) "Leaves lanceolate; lower ones emarginate, mucronate; peduncles one-flowered; outer calyx-leaves ſemiovate, large." *Stem* rooting at the bottom, muricated upwards, with ſmall ſpines, and having minute hairs ſcattered over it at the top. *Leaves* thickiſh, veinleſs, ſmooth; lower ones acute at the baſe; upper ones rounded at the baſe, mucronate. *Peduncles* ſolitary, with two minute bractes above the middle; calyx-leaves ſmooth, the length of the corolla; three outer ones acute, mucronate; two inner ones linear-lanceolate, attenuated; corolla with five lines on the outſide, which are cloſely beſet with fulvous ſhining hairs; ſtigma capitate. Capſule ſmooth, ſhorter than the calyx. A native of the Eaſt Indies. 15. C. *nitidus.* Deſr. 19. Lam. 2018. "Leaves oval, ſhining, ſilky-white underneath; peduncles one-flowered, ſhorter than the petiole." *Root* perennial. The young branches, petioles, leaves, peduncles, and calyxes, cloathed with a ſilky ſhining down. *Stem* cylindrical, woody, almoſt ſmooth. *Leaves* broad-oval, alternate, acute, entire, nerved, about twice the length of the petioles. *Peduncles* axillary, ſolitary, with two awl ſhaped bractes about the middle; calyxes ſhort; two inner leaves ſmaller; corollas at leaſt two inches long, funnel-ſhaped. A native of the Philippine iſlands. Specimen in the herbarium of Juſſieu. 16. C. *chenopodioides*. Deſr. 21. Lam. 2020. "Villous; leaves egg-ſhaped, ſerrate-ſinuated; flowers ſolitary, nearly ſeſſile." *Stems* ſlender, weak, cylindrical. *Leaves* an inch long; petioles about half their length, channelled. *Peduncles* axillary, ſolitary; bractes two, ſmall, filiform, rather long; leaves of the calyx egg-ſhaped, acute, corollas narrow, tabular. In the herbarium of La Marck. 17. C. *medium*. Linn. Sp. Pl. 4. Mart. 6. Deſr. 10. Lam. 2009. Willd. 12. "Leaves linear, haſtate-acuminate; auricles toothed; peduncles one-flowered; calyxes arrow-ſhaped." Plant ſmooth in all its parts. *Root* annual. *Stems* very ſlender. *Peduncles* axillary, ſolitary, often bent in the middle at the origin of the two bractes; upper half angular, thicker; three outer leaves of the calyx large, nearly as long as the peduncles, acute, arrow-ſhaped at the baſe, like thoſe of campanula medium; auricles terminated by two or three ſmall teeth; two inner ones entire, acute, a little ſhorter; corolla not longer than the calyx. A native of Madagaſcar and the Eaſt Indies. 18. C. *filicaulis*. Mart. 88. Willd. 13. Vahl. Sym. 3. 24. "Leaves linear-lanceolate, obtuſe, mucronate, dilated and toothed at the baſe; calyx leaves oblong." *Root* annual. *Stem* herbaceous, filiform, branched. *Leaves* on very ſhort petioles, diſtant, two inches long or more, tender, veined, quite ſmooth. *Peduncles* axillary, filiform, thicker at the top; bractes two, oppoſite, awl-ſhaped, above the middle of the peduncle; calyx-leaves mucronate, ſmooth; ſtigma ſimple, bluntiſh. A native of Guinea. 19. C. *tridentatus*. Linn. Sp. Pl. Ed. 1. Mart. 76. Deſr. 12. Lam. 2011. Willd. 14. Pluk. Alm. 117. tab. 276. fig. 6. & Mant. 117. tab. 167. fig. 5. (Evolvulus tridentatus; Linn. Sp. Pl. Ed. 2. Fendera-claudi; Rheed. Mal. 11. 133. tab. 65.) "Leaves ſpatulate-linear, three-toothed at the tip, dilated and toothed at the baſe; calyx-leaves elliptical, cuſpidate." *Root* annual. *Stems* filiform, ſmooth, ſlightly ſtriated, almoſt ſimple. *Leaves* alternate, about half an inch long, ſmooth; petioles about a line long. *Flowers* purpliſh at the baſe, with a yellowiſh white border; peduncles axillary, ſolitary, one-flowered, longer than the leaves, with two ſmall bractes near their ſummit. A native of the Eaſt Indies. Introduced into England in 1778, by ſir Joſeph Banks. 20. C. *anguſtifolius*. Mart. 89. Deſr. 32. Lam. 2030. Willd. 15. (Ipomæa anguſtifolius; Jacq. ic. 2. tab. 317.) "Leaves linear, haſtate, obtuſe, mucronate, ſmooth; auricles generally entire; peduncle one-flowered." *Root* ſpindle-ſhaped, riſing about an inch above the ſurface of the ground, with the appearance of a ſlender, ſimple, erect, leafleſs ſtem. *Stems* ſeveral, ſcarcely a foot high, a little twining, almoſt ſimple, filiform, weak. *Leaves* an inch long, about a line broad, numerous, on very ſhort petioles. *Flowers* yellow, longer than the calyx; peduncles axillary, ſolitary, ſhorter than the leaves, with two awl-ſhaped bractes, about the middle, upper half thicker; calyx-leaves connivent, lanceolate, mucronate; corolla funnel-ſhaped; border very open; diviſions egg-ſhaped, obtuſe; ſtigma globular, didymous. *Capſule* two-celled. A native of Guinea and the Eaſt Indies. 21. C. *ariſtolochifolius*. Mill. Houlton MSS. "Leaves haſtate-lanceolate; auricles rounded; peduncles many-flowered." *Root* annual. *Stem* ten feet high, ſlender. *Flowers* yellow, in ſmall cluſters, on long peduncles. *Capſules* trigonous, three-celled. *Seeds* two in each cell. Seeds ſent to Mr. Miller from Carthagena in New Spain. 22. C. *Adanſonii*. Deſr. 82. Lam. 2080. "Leaves haſtate, linear,; ſtipules in pairs, ſomewhat filiform; calyx muricated." *Stems* herbaceous, weak, a little villous. *Leaves* alternate, diſtant, petioled, entire, ſmooth, from three to four inches long; ſtipules about an inch long. *Flowers* near two inches long, axillary; peduncles nearly the length of the petioles, ſmooth, with two ſmall bractes about the middle; calyx-leaves egg-ſhaped, rough, with ſharp tubercles. A native of Senegal. 23. C. *japonicus*. Mart. 7. Deſr. 6. Lam. 2005. Willd. 16. Thunb. jap. 85. (Kos and Kudſi vulgo Firaga wo; Kempf. Amæn. 5. 856.) "Leaves haſtate, lanceolate, acute; lateral lobes one-toothed; peduncles one-flowered; ſtem ſimple." *Stems* filiform, ſmooth. *Leaves* alternate, almoſt unilateral, petioled, ſmooth; middle lobe an inch long, lanceolate, entire, acute; ſide ones a little reflexed, ſhorter. *Flowers* axillary, ſolitary; peduncles as long as the leaves, filiform, ſmooth; calyx-leaves egg-ſhaped, acute, entire, ſmooth. A native of Japan. 24. C. *ebracteatus*. Deſr. 7. Lam. 2006. "Leaves cordate-arrow-ſhaped, obtuſe behind; peduncles ſhorter than the petiole, without bractes." Whole plant, except the corolla, cloathed with ſhort white hairs. *Stems* ſcarcely a foot and a half long, ſlender. *Leaves* alternate, acute. *Flowers* white, ſmall; peduncles one or two-flowered; ſegments of the calyx five; two outer ones broader; ſtigmas two, globular, purpliſh. Native country unknown. Cultivated in the botanic garden at Paris. 25. C. *leucanthus*. Deſr. 8. Lam. 2007. (Ipomæa leucantha; Jacq. Coll. 2. 280. ic. 2.) "Leaves heart-ſhaped, acuminate: peduncles ſhorter than the petiole." *Root* annual. *Stems* about four feet high, ſlender, cylindrical, branched, reddiſh, and ſomewhat rough towards the bottom. *Leaves* alternate, entire, or ſlightly ſcolloped, ſmooth. *Flowers* white; peduncles axillary, ſolitary, an inch long, erect, cylindrical, ſmooth, one-flowered: calyx leaves mucronate, a little open at the ſummit, ciliated at the baſe; corolla funnel-ſhaped: anthers purpliſh; ſtigma two-lobed. A native of America in the torrid zone. 26. C. *fruticuloſus*. Deſr. 9. Lam. 2008. "Shrubby; leaves ſomewhat heart-ſhaped at the baſe, linear, lanceolate, petioles ſhort; flowering branches, thick ſet with leaves." *Root* perennial. *Stems* three or four feet high, cylindrical, ſlender. *Leaves* not more than two lines broad, ſloped at the baſe, on very ſhort petioles. *Flowers* with five purple rays; peduncles larger than the petioles, ſcarcely the length of the flowers; bractes two, ſmall, awl-ſhaped, unequal, ſituated nearer to the ſtem than to the calyx; calyx ſmooth; corolla ſhallowly five-lobed. A native of the Canary iſlands, flowering in April and May. 27. C. *dentatus*. Mart. 90. Willd. 17. Vahl. Symb. 3. 25. "Leaves haſtate, ſmooth; auricles toothed; peduncles many-flowered, muricated." *Stem* cylindrical, ſmooth. *Leaves* ſcarcely an inch long, ſomewhat heart-ſhaped at the baſe; middle lobe lanceolate, quite entire; ſide ones roundiſh, unequally four or five-toothed; petioles filiform, often ſomewhat muricated towards the baſe. *General peduncles* ſpreading, thicker, and a little longer than the petioles; partial peduncles in threes; that in the middle one-flowered; ſide ones with two or three pedicelled flowers; both muricated; rigid; calyx-leaves oblong, obtuſe, mucronate, equal. A native of the Eaſt Indies, found by Schumacher. 28. C. *haſtatus*. Mart. 79. Willd. 18. Vahl. Symb. 1. 15. Forſk. deſcr. 203. "Leaves lanceolate, haſtate; peduncles axillary, in pairs, two-flowered." *Stem* hairy. *Leaves* remote, quite entire, ſmooth on the upper ſurface, villous on the lower; auricles rounded, ſometimes with one tooth behind: petiole half the length of the leaf. *Peduncles* ſhorter than the petiole, villous; calyx-leaves hairy, acuminate, patulous at the tip. A native of Egypt and Arabia. 29. C. *Sonneratii*. (C. haſtatus; Deſr. 11. Lam. 2010. Tala-neli; Rheed. Mal. 11. 113. tab. 55.) "Leaves linear, haſtate-acuminate; auricles toothed; calyx-leaves ſimple." Whole plant ſmooth. *Stems* very ſlender, ſlightly angular. *Leaves* about two lines broad, alternate, nearly ſeſſile. *Peduncles* longer than the flower, ſlender, one or two-flowered, often bent at the inſertion of the bractes, thicker upwards; bractes two, ſmall, awl-ſhaped, ſituated a little above the middle of the peduncle. *Flowers* yellowiſh-white, twice the length of the calyx; calyx-leaves egg-ſhaped, acute. A native of the Eaſt Indies, communicated to La Marck by Sonnerat. 30. C. *aſarifolius*. Deſr. 89. Lam. 2087. "Leaves kidney-ſhaped, broad, veined; peduncles one or two-flowered." *Stems* cylindrical, ſmooth, not much branched. *Leaves* alternate, large, entire, ſmooth, firm; petioles about two inches long, channelled. *Peduncles* longer than the petioles; bractes from two to four, ſmall, awl-ſhaped, ſituated almoſt cloſe to the flowers; calyx-leaves ſhort, egg-ſhaped, obtuſe, two outer ones ſmaller; corollas at leaſt two inches long, tubular; tube about half an inch diameter; border but little open, with five pointed diviſions; ſtigma capitate, didymous. A native of Senegal. 31. C. *tiliæfolius*. "Shrubby; leaves heart-ſhaped, rounded; younger ones ſomewhat tomentous; flower and fruit very large." *Stems* cylindrical, almoſt ſmooth. *Leaves* alternate, a little orbicular, entire; petioles about half the length of the leaves, channelled. *Flowers* large; peduncles not more than eight or ten lines long, axillary, ſolitary, one-flowered; calyx-leaves ſhort, obtuſe, almoſt round; corolla at leaſt three inches long, almoſt cylindrical; tube narrow as far as the length of the calyx, afterwards eight or ten lines in diameter; ſtigma capitate, two lobed. *Capſule* about the ſize of a walnut, apparently two-celled. A native of the Iſle of France, and the Cape of Good Hope. Found by Commerſon. 32. C. *panduratus*. Linn. Sp. Pl. 5. Mart. 8. Deſr. 91. Lam. 2089. Willd. 19. (C. megalorrhizos; Dill. Elth. 101. tab. 85. fig. 99.) "Leaves, ſome heart-ſhaped, entire, others panduriform or three-lobed; peduncles longer than the petiole, about two-flowered." *Root* perennial, thick, ſpindle-ſhaped. *Stems* long, ſlender. *Leaves* diſtant, petioled. *Flowers* large, white, with the bottom of fine purple; peduncles axillary, ſolitary, from one to three-flowered; calyx-leaves ſhort, two outer ones ſhorter and narrower. *Capſule* two-celled. *Seeds* hirſute, one in each cell. A native of Carolina and Virginia, flowering from June to September. 33. C. *betonicifolius*. Mart. 72. "Leaves cordate-arrow-ſhaped, acute; peduncles one-flowered." *Stem* five or ſix feet high, ſlender. *Flowers* white, with purple bottoms; peduncles long, ſlender. A native of Africa, cultivated by Miller in 1730. 34. C. *bracteatus*. Mart. 91. Vahl. Sym. 3. 25. "Leaves heart-ſhaped, almoſt entire, and three-lobed, haſtate, attenuated; peduncles one-flowered; outer calyx-leaves bracte-ſhaped." *Stem* thinly beſet with ſhort hairs. *Leaves* two inches long; petioles ſhorter than the leaf, pubeſcent. *Peduncles* the length of the leaf, ſolitary; bractes two, lanceolate, acute, ſituated a little below the calyx; calyx pubeſcent; inner calyx-leaves oblong, bluntiſh, nerved; outer ones much broader, encloſing the others as between two bractes; corolla villous on the outſide, tender, ſilky; border five-cleft; ſtigma capitate, two lobed, found in the Eaſt Indies by Koenig. 35. C. *bicolor*. Mart. 92. Willd. 21. Vahl. Symb. 3. 25. "Leaves heart-ſhaped, villous, ſomewhat angular-lobed at the baſe; peduncles one-flowered; outer leaves of the calyx reſembling bractes." *Stem* villous. *Leaves* acute, mucronate, not attenuated, nearly equal in length and breadth, one, two, or three-lobed at the bottom, villous on both ſides; very ſoftly villous, hoary, and obſcurely veined underneath; the younger ones ſilky. *Flowers* white, with a violet purple baſe; bractes, calyx, and corolla, as in the preceding ſpecies. Found in the Eaſt Indies by Schumacher. 36. C. *Geffroyenſis*. (C. bicolor; Deſr. 96. Lam. 2094.) Hairy; leaves ſomewhat heart-ſhaped, three-lobed, hoary underneath; peduncles many-flowered." On a ſuperficial view having the appearance of a bramble. *Stems* ſlender, cylindrical; beſet, as well as the petioles, peduncles, and calyxes, with blackiſh points, and hiſpid with rather long ſtiffiſh hairs. *Leaves* alternate, longer than their petioles, cloathed with fine recumbent hairs, green on the upper ſurface, hoary underneath; lobes oval, acute, entire. *Flowers* ſmall; peduncles axillary, ſolitary, thicker and longer than the petioles, dichotomous; bractes two, linear, awl-ſhaped, ſituated at each diviſion of the peduncles; calyx-leaves narrow, acute, rather long. Brought from Senegal by M. Geoffroy. 37. C. *trilobus*. Willd. 22. Thunb. prod. 35. "Leaves heart-ſhaped, villous, three-lobed; lobes egg-ſhaped, acute; peduncles one flowered." A native of the Cape of Good Hope. 38. C. *ſubquinquelobus*. (C. trilobus; Deſr. 94. Lam. 2092. Ipomæa triloba; Linn.) "Lower leaves heart-ſhaped, three-lobed; upper ones ſomewhat five-lobed; peduncles three-flowered." *Root* annual. *Stems* two or three feet long, ſlender, ſlightly angular, ſmooth. *Leaves* alternate, generally ſhorter than their petioles; middle lobes of the lower leaves egg-ſhaped, obtuſe, mucronate, ſmooth; lateral lobes of the upper leaves with a deep ſinus, which makes them appear five-lobed. *Flowers* purple or violet; peduncles angular, nearly the length of the petioles; pedicels very ſhort, bractes ſmall, egg ſhaped; calyx-leaves half the length of the corolla, ſmooth, egg-ſhaped, acute, connivent; corollas ſmall, cylindrical; border with five ſharp teeth. A native of South America, cultivated in the botanic garden at Paris. 39. C. *platanifolius*. Mart. 93. Willd. 23. Vahl. Symb. 3. 26. Pluk. phyt. tab. 167. fig. 3. Feuil. peruv. 3. 16. tab. 11. "Leaves heart-ſhaped, three-lobed; lateral lobes toothed-angular; peduncles, ſomewhat three-flowered; calyxes almoſt as long as the peduncles, ſmooth." Whole plant quite ſmooth, except the petioles. *Stem* cylindrical. *Leaves* two inches long or more, glaucous, green underneath, with purpliſh veins; lobes lanceolate; middle one longer, broader, quite entire, acuminate; lateral ones narrower, attenuated, with a ſmaller broader lobe at the bottom on each ſide, rounded behind, and furniſhed with an angular tooth; petioles ſhorter than the leaf, beſet with a few ſcattered hairs. *Peduncles* ſolitary, ſhorter than the leaf, thickened at the top; lower ones three-flowered; middle ones two-flowered, uppermoſt one-flowered; calyx-leaves oblong, ſomewhat membranous, ending in a briſtle; ſtigma capitate. It differs altogether from C. batatas in the ſmoothneſs of the ſtem, and the form of the leaves. A native of America. 40. C. *acuminatus*. Mart. 94. Willd. 24. Vahl. Symb. 3. 26. "Leaves heart-ſhaped and three-lobed, attenuated; peduncles elongated, many-flowered; calyxes ſmooth." *Stem* with a few minute ſcattered hairs, preſſed cloſe, and viſible only with a magnifier. *Leaves* four inches long, three or more broad at the baſe, three-lobed or entire, quite ſmooth, nerved, acute; lateral lobes lanceolate; middle one egg-ſhaped, attenuated; petioles longer than the leaf. *Flower* large, bell-ſhaped, purple with a pale baſe and five paler rays running to the margin; peduncles axillary, the length of the petioles alternate; pedicels about five, an inch and half long; bractes at the baſe of each pedicel two, lanceolate, attenuated, finely nerved, ſmooth; calyx-leaves lanceolate, attenuated, tender, finely nerved, quite ſmooth; two inner ones a little ſhorter, ſtigma capitate. A native of the iſland of Santa Cruz in the Weſt Indies. 41. C. *carolinus*. Linn. Sp. Pl. 6. Mart. 9. Deſr. 90. Lam. 2088. Willd. 25. Dill. elth. 100. tab. 84. fig. 98. "Leaves heart-ſhaped, entire, and three-lobed, villous; calyxes even-ſurfaced; capſules hirſute; peduncles one or two-flowered." *Root* perennial. *Stems* ſlender, reddiſh towards the root, hairy at the joints. *Leaves* alternate, ſcarcely two inches long, ſome entire, others like thoſe of ivy; petioles about the length of the leaves, ſlender, channelled. *Flowers* pale purple, reſembling thoſe of C. arvenſis; peduncles the length of the petioles, thicker, axillary, ſolitary, angular, with a few narrow bractes; calyx-leaves egg-ſhaped, acute, ſcarcely half the length of the corolla, a little ciliated at the edges with whitiſh hairs. *Capſules* round, hairy towards the ſummit, two-celled, four-valved. *Seeds* two in each cell. A native of Carolina. 42. C. *hederaceus*. Linn. Sp. Pl. 7. Mart. 10. Deſr. 92. Lam. 2090. Dill. elth. 99. tab. 83. fig. 96. Gært. tab. 134. fig. 2. "Leaves heart-ſhaped, entire and three-lobed; corollas undivided; fruit erect." Linn. "Peduncles about three-flowered; calyxes tubercled." Lam. *Root* annual. *Stems* ſarmentous, cylindrical, dull red, two or three feet high. *Leaves* alternate, petioled, cloathed with fine ſhort hairs. *Flowers* fine blue, with a pale baſe; peduncles nearly the length of the petioles, axillary, ſolitary, hairy; bractes ſmall; pedicels very ſhort; calyx-leaves rough with numerous long hairs, and ſmall black tubercles; two of them narrower. *Capſules* ſpherical, ſmooth, thin, three-celled, three-valved. *Seeds* two in each cell, black, ſmooth. A native of Aſia, Africa, and America. 43. C. *Dillenii*. Deſr. 22. Lam. 2021. Dill. elth. 97. tab. 81. fig. 93. "Leaves heart-ſhaped, entire, and three-lobed; flowers ſolitary, almoſt ſeſſile." Diſtinct from the preceding, with which it has been confounded. *Root* annual. *Stems* long, ſlender, hairy. *Leaves* alternate, ſlightly villous, paler underneath; lobes angular; petioles ſhorter than the leaves, hairy. *Flowers* fine blue, with a whitiſh baſe; peduncles axillary, ſolitary; calyxes oblong, five-cleft, hairy; corollas large, very open, almoſt entire, ſuppoſed to be a native of Africa. 44. C. *nil*. Linn. Sp. Pl. 8. Mart. 11. Willd. 27. Bot. Mag. 188. C. cæruleus; Ger. em. 864. fig. 1. C. hederaceo anguloſo folio; Bauh. p. 295; Dill. elth. 96. tab. 8. fig. 91, 92. Ipomæa hederacea; Lam.? J. trilobata; Thun. Flor. jap. 86. Linn. Tranſ. 2. 330.) "Leaves heart-ſhaped, three-lobed; corollas ſemiquinquefid; peduncles ſhorter than the petiole." *Root* annual. *Stem* eight or ten feet high. *Leaves* woolly, acuminate, on long petioles. *Flowers* deep blue, with purple rays; peduncles two-flowered. *Fruit* erect. Nil is an abbreviation of Anil, one of the names of indigo. A native of America. 45. C. *purpureus*. Linn. Sp. Pl. 9. Mart. 12. Willd. 28. Bot. Mag. 113. (C. purpureus folio ſubrotundo; Bauh. p. 295. Ipomæa purpurea; Lam.) "Leaves heart-ſhaped, undivided; fruit nodding; pedicels thickened." *β*. cæruleus minor, folio ſubrotundo. Dill. elth. 98. tab. 83. fig. 95. ſmaller, blue-flowered, with a roundiſh leaf. *γ*. C. folio cordato glabro. Dill. elth. 98. tab. 84. fig. 97. with a heart-ſhaped ſmooth leaf. *δ*. elatior; Bot. Mag. 1005. Stems very high; leaves orbicular-heart-ſhaped; flowers white, with five ſpots, elegantly ſhaded with blue and carmine. All the varieties are natives of America. The firſt is a hardy annual, common in the Engliſh gardens, under the name of Convolvulus major. 46. C. *obſcurus*. Linn. Sp. Pl. 10. Mart. 14. Deſr. 15. Lam. 2014. Willd. 29. Dill. elth. 98. tab. 83. fig. 95. "Leaves heart-ſhaped, undivided; ſtem ſomewhat pubeſcent; peduncles thickened, one-flowered; calyxes ſmooth." *Root* annual. *Stems* cylindrical, villous towards the top, three or four feet high. *Leaves* alternate, acute, green, and ſmooth above, paler and a little villous underneath; petioles one or two inches long. *Flowers* white, with a purple baſe and yellowiſh rays; peduncles longer than the petioles, ſlender, ſlightly pubeſcent towards the bottom, with two ſmall bractes. A native of Java, and other parts of the Eaſt Indies. 47. C. *flavus*. Willd. 30. (Evolvulus hederaceus; Burm. Ind. 77. tab. 30. fig. 2.) "Leaves heart-ſhaped, repand, ſomewhat lobed, with ſmall mucronate teeth; peduncles bifid, many-flowered." *Stem* rather ſmooth. *Leaves* acuminate, ſomewhat ſcabrous. *Peduncles* much longer than the leaves; upper ones three-flowered; lower ones bifid; branches three-flowered, with a ſingle flower at the diviſion. A native of the Eaſt Indies. 48. C. *angularis*. Linn. Mant. 203. Mart. 13. Deſr. 98. Lam. 2098. Willd. 31. Burm. Ind. 46. tab. 19. fig. 2. "Leaves heart-ſhaped, pentangular, quite entire, villous; peduncles many-flowered." *Stems* pubeſcent. *Leaves* on ſhort petioles, quite entire, rough with reddiſh ſhining hairs. *Flowers* orange; peduncles the length of the leaves, axillary, ſolitary, moſt commonly three-flowered; calyx hairy; ſegments acute; corollas bell-ſhaped, three times longer than the calyx. A native of the Eaſt Indies. 49. C. *Batatas*. Linn. Sp. Pl. 11. Mart. 15. Willd. 32. (Batatas; Bauh. Pin. 91. Rumph. Amb. 5. 367. tab. 130. C. radice tuberoſa eſculenta; Cateſb. Car. tab. 60. Ipomæa Batatas; Lam.) Spaniſh or ſweet potatoes. "Leaves heart-ſhaped, haſtate, five-nerved; ſtem hiſpid, creeping, bearing tubers." *Root* perennial. *Stem* cylindrical, perennial, hiſpid, proſtrate, creeping; ſending out ſcattered, oblong, acuminate tubers, purple or pale on the outſide. *Leaves* angular, on long petioles. *Flowers* purple, large, about three together, on upright peduncles. A native of the Weſt Indies, whence it is ſaid to have been introduced by the Spaniards into the Philippine iſlands. It is now extenſively cultivated in the tropical climates of both hemiſpheres, for the ſake of its tubers. They are ſweet, ſapid, and eſteemed nouriſhing, and are the common potatoe of our old Engliſh botaniſts. There are ſeveral varieties, and probably more than one diſtinct ſpecies. 50. C. *maximus*. Linn. jun. Sup. 137. Mart. 25. Willd. 33. Vahl. Symb. 3. 268. (C. marginatus; Deſr. 72. Lam. 2071. Tiru-tali; Rheed. Mal. 11. 109. tab. 53.) "Leaves heart-ſhaped, acute, ſmooth; peduncles many-flowered, ſmooth; ſtem ſomewhat hairy." *Root* perennial, fibrous. *Stems* cylindrical, ſlender, reddiſh. *Leaves* alternate, thin, ſoft, even-ſurfaced, bordered with red; petioles rather long, thick, channelled, reddiſh. *Flowers* pale red, with a purple baſe, funnel-ſhaped; peduncles axillary, ſolitary, thicker than the branches from which they ſpring, ſeven or eight-flowered; calyx-leaves ſhort, ſomewhat acute; ſtigma capitate, two-lobed. A native of the Eaſt Indies. 51. C. *biflorus*. Linn. Sp. Pl. Append. p. 1668. Mart. 16. Willd. 34. "Leaves heart-ſhaped, pubeſcent; peduncles in pairs; corollas with trifid lobes. *Root* annual. *Stem* cylindrical, hairy, branched at the baſe, about the ſize of C. arvenſis. *Leaves* oblong; petioles cylindrical, hairy, ſhorter than the leaf. *Flowers* white; peduncles hairy, approximating at the baſe, ſhorter than the petioles; calyx five-leaved; two outer leaves cordate-oblong; two inner ones linear-lanceolate; the fifth ſemi-heart-ſhaped; corolla ſmall, campanulate, quinquefid, plaited; lobes trifid at the tip; middle lobe ſmaller; tube ſhorter than the calyx; ſtigmas two, capitate, purple. A native of China. 52. C. *gemellus*.

Mart. 95. Deſr. 71. Lam. 2070. Vahl. Symb. 3. 27. Burm. ind. 46. tab. 41. fig. 1. "Leaves heart-ſhaped, ſomewhat villous underneath, peduncles two-flowered." *Stem* tender, pubeſcent at the top. *Leaves* an inch long, obſcurely ſeven-nerved, a little acuminate; petioles the length of the leaves. *Flowers* white; peduncles the length of the petioles; pedicels almoſt as long as the peduncles; one ſhorter, without bractes; the other with two bractes in the middle; both turned back when the fruit ripens; calyx-leaves oblong, obtuſe: corolla campanulate, ſix times as large as the calyx, ſmooth: ſtigma capitate. A native of Java and Tranquebar. 53. C. *triflorus*. Mart. 102. Willd. 42. Vahl. Symb. 5. 30. "Leaves cordate-lanceolate, attenuated, obtuſe, ſmooth; peduncles three-flowered." *Stem* herbaceous, ſmooth. *Leaves* two inches long, quite entire, ſimply veined, rounded at the end and mucronate; lobes rounded at the end, ſometimes but rarely obſcurely angular; petiole ſhort. *Peduncles* ſhorter than the leaf; pedicels angular, without bractes, equal, almoſt the length of the peduncle. *Calyx-leaves* obtuſe. *Corolla* three times the length of the calyx; lobes hairy at the tip. *Stigma* capitate. A native of the Eaſt Indies, obſerved by Koenig. 54. C. *latifolius*. Deſr. 85. Lam. 2083. Plum. Cat. 1. and MSS. "Leaves heart-ſhaped, ſmooth; peduncles about three-flowered; corolla ſalver-ſhaped, very large." *Stems* very long. *Leaves* alternate, large, thin, acuminate, bright green; petioles channelled. *Flowers* white: peduncles axillary, ſolitary, thicker than the petioles, a little angular under the pedicels: calyx-leaves ſmall; three outer ones long, acute; two inner ones egg-ſhaped, obtuſe; tube of the corolla long, narrow, greeniſh; border near five inches in diameter, expanded, almoſt flat, ſlightly ſinuated at the edges, marked with a greeniſh-white ſtar. *Fruit* membranous, top-ſhaped, about the ſize of a walnut. *Seeds* three or four. A native of St. Domingo and Martinico. 55. C. *hypocrateriformis*. Deſr. 84. Lam. 2082. "Leaves heart-ſhaped; corolla ſalver-ſhaped; border five-cleft; ſegments emarginate." *Branches* woody, cylindrical. *Leaves* alternate, near together, about an inch long, coriaceous, ſmooth, ſcarcely pointed; petioles rather ſhorter than the leaves, angular. *Peduncles* axillary, ſolitary, or in pairs, one-flowered, nearly as long as the petioles, thickened upwards; bractes ſituated above the middle of the peduncle, linear-lanceolate, reaching almoſt to the top of the calyx; calyx-leaves ſhort, egg-ſhaped, obtuſe; tube of the corolla near two inches long; border at leaſt an inch and half in diameter, very flat. A native of the Eaſt Indies; deſcribed from an imperfect ſpecimen gathered by Sonnerat. 56. C. *ſtriatus*. Mart. 96. Willd. 36. Vah. Symb. 3. 28. "Leaves heart-ſhaped, attenuated, ſmooth; peduncles longer than the leaf, about four-flowered; corollas ſmooth, ſtriated on the outſide." *Stem* herbaceous, cylindrical, ſlender, pubeſcent. *Leaves* two inches long, remote, quite entire, with a rounded mucronate point, ſmooth on both ſides except the rib, ſimply veined; petioles the length of the leaves, pubeſcent. *Peduncles* longer than the leaves, ſolitary, pubeſcent; pedicels in threes; lateral ones jointed, one of them often two-flowered; intermediate one ſhorter, thicker, without bractes. *Bractes* two, ſituated at the joints about the middle of the lateral pedicels, oblong, concave, ſmall, villous, deciduous. *Calyx-leaves* oblong, obtuſe, concave, equal; two outer ones villous, ſomewhat hoary. *Corolla* campanulate, twice the length of the calyx, white, with a purpliſh baſe and five paler lanceolate-ſtriated rays extending to the margin; ſtigma capitate, two-lobed. 57. C. *domingenſis*. Deſr. 59. Lam. 2058. "Leaves heart-ſhaped; racemes numerous, unilateral; calyx acute, ſmooth." *Stems* ſlender, cylindrical, ſmooth, fruteſcent. *Leaves* alternate, acute, ſmooth, except the middle nerve underneath; petioles of a moderate length, channelled. *Flowers* in ſmall peduncled racemes, numerous, ſituated near the extremities of the branches, often pendant; bractes very ſmall, awl-ſhaped, at the foot of the pedicels; calyx-leaves ſmooth, egg-ſhaped, elongated, unequal in ſize; corollas bell-ſhaped, expanding; ſtigmas capitate, two-lobed. A native of St. Domingo. 58. C. *ſinenſis*. Deſr. 69. Lam. 2068. "Hairy; leaves heart-ſhaped, acute; peduncles two or three flowered; calyx-leaves heart-ſhaped." Whole plant, eſpecially near the ſummit, cloathed with ſeparate, fine, whitiſh hairs. *Stems* ſlender, cylindrical. *Leaves* alternate, entire, on longiſh ſomewhat villous petioles. *Peduncles* ſhorter than the petioles, axillary, ſolitary; bractes ſmall, awl-ſhaped; three exterior calyx-leaves broader than the others, heart-ſhaped at the baſe, very rough with hairs; corollas campanulate, a little longer than the calyx. Suppoſed to be a native of China. 59. C. *pentanthus*. Willd. 37. Jacq. ic. rar. 2. 316. Collect. 14. 210. "Leaves heart-ſhaped, acuminate, ſmooth, ſomewhat repand; umbels peduncled, capitate, five-flowered; calyxes ciliated." *Root* perennial. *Stem* ſhrubby. *Flowers* nearly ſeſſile. Native country unknown. 60. C. *guianenſis*. Mart. 97. Deſr. 58. Lam. 2057. Aubl. guian. 1.136. tab. 52. "Leaves ſomewhat heart-ſhaped, mucronate, tomentous; flowers collected into a kind of corymbous head, on very long peduncles." *Root* perennial. *Stems* a little woody at the baſe, cylindrical, villous. *Leaves* alternate, two inches long, quite entire, veined, nerveleſs; petiole only half the length of the leaf, a little channelled, tomentous. *Flowers* pale blue, or whitiſh; peduncles ſeven inches long, axillary, villous; pedicels very ſhort, intermingled with filiform bractes; calyxes villous, deeply divided into five lanceolate ſegments; corollas ſmall; lobes of the border acuminate; ſtigmas two, reflexed. A native of Guiana. 61. C. *capitatus*. Mart. 98. Deſr. 57. Lam. 2056. Willd. 39. Vahl. Symb. 3. 28. "Hiſpid; leaves heart-ſhaped; flowers capitate, involucred: peduncles ſcarcely longer than the petiole." Whole plant hiſpid, with long diſtinct hairs of a dirty white colour, placed on minute tubercles. *Stem* ſlender, cylindrical. *Leaves* from two to three inches long, alternate, acute, entire; petioles nearly the length of the leaf. *Peduncles* axillary, ſolitary, with about five ſeſſile flowers collected into a cloſe head. *Involucre* conſiſting of ſix or ſeven egg-ſhaped acute bractes, of unequal ſize, generally as long as the calyx: calyx-leaves one third of the length of the corolla, ovate-lanceolate, acuminate, ſmooth within; corolla hiſpid on the outſide with long hairs arranged in five lines. *Capſule* globular, ſhorter than the calyx, even-ſurfaced, ſmooth. Found in the Eaſt Indies by Koenig and in Senegal by Geoffroy. 62. C. *crinitus*. Deſr. 112. Lam. 2114. "Leaves heart-ſhaped, almoſt ſmooth; heads of flowers very hirſute, on long peduncles, involucred; capſule even-ſurfaced." *Stem* herbaceous. Specimen in the herbarium of Juſſieu. 63. C. *hiſpidus*. Mart. 99. Willd. 40. Vahl. Symb. 3. 29. "Extremely hirſute; leaves cordate-egg-ſhaped; flowers umbelled; peduncles very ſhort." *Leaves* from two to three inches long, attenuated, quite entire; petiole half the length of the leaf. *Pedicels* the length of the peduncle. *Calyx-leaves* lanceolate, attenuated, ſmooth within, lax. *Corolla* ſmooth. *Stigma* capitate. A native of the Eaſt Indies. 64. C. *parviflorus*. Mart. 100. Willd. 42. Vahl. Symb. 3. 29. (Ipomœa paniculata; Burm. Ind. 50. tab. 21. fig. 3.) "Leaves heart-ſhaped, acuminate, ſmooth; peduncles many-flowered; calyxes acuminate, villous." *Stem* weak, ſlightly villous at the top.

Leaves an inch long; petiole the length of the leaf, filiform, villous. *Flowers* blue; peduncles the length of the petioles; pedicels umbelled; lateral ones ſometimes branched; calyx-leaves egg-ſhaped, acuminate, ſmall; corolla ſmooth, twice the length of the calyx, five-cleft; ſtigma bifid; ſegments revolute. A native of Java. 65. C. *verticillatus*. Linn. 12. Mart. 17. Willd. 43. Brown. Jam. 153. (C. nodiflorus, Lam?) "Leaves oblong, heart-ſhaped, oblong, naked; peduncles umbelled, bifid, many-flowered." *Leaves* roughiſh, ſomewhat repand. *Flowers* blueiſh, ſmall, campanulate, not cut; peduncles ſhorter than the leaf; pedicels often ſomewhat divided. A native of North America. 66. C. *ſolanifolius*. (C. parviflorus; Deſr. 66 Lam. 2065. Quamoclit purpurea ſolanifolia minor; Plum. MSS. 2. tab. 62. Burm. Amer. 83. tab. 94. fig. 2.) "Leaves cordate-oblong, mucronate; peduncles branched, many-flowered, ſhort, appearing verticillate." Diſtinct from the preceding. *Roots* the thickneſs of the human little finger, much branched. *Stems* very ſlender, long, branched. *Leaves* ſinuated, ſlightly tomentous; petioles rather ſhort. *Flowers* purpliſh, ſmall, campanulate, deeply five-cleft, as repreſented in Plumier's figure; peduncles axillary, ſhorter than the leaves; pedicels forming a corymb. *Capſules* four-celled. *Seeds* yellow, angular. A native of St. Domingo, on ſtony hills, communicated to La Marck by Joſeph Martyn. 67. C. *violaceus*. Mart. 101. Willd. 44. Vahl. Symb. 3. 29. "Leaves cordate-egg-ſhaped, acute: peduncles elongated, bifid, many-flowered; two outer calyx-leaves cordate-egg-ſhaped, acute." *Stem*, *petioles*, *peduncles*, and *calyxes* villous. *Leaves* an inch long. *Flowers* violet, with five lanceolate paler rays; peduncles four or five times longer than the leaf; pedicels three or five-flowered, with a pair of linear-lanceolate bractes at the baſe; calyx-leaves tender; two innermoſt ones only half the ſize of the others, ſomewhat membranous, ſmooth, mucronate; corolla campanulate; ſtigmas two, reflexed. It varies with reſpect to the hairineſs of the leaves. A native of the iſland of Santa Cruz. 68. C. *azureus*. Deſr. 56. Lam. 2055. "Leaves ſomewhat heart-ſhaped, acute, naked; flowers collected into a head on a very long petiole." *Stem* woody, finely ſtriated, firm and greyiſh near the bottom, twining and ſomewhat villous towards the top. *Leaves* near an inch and half long, a little longer than the petioles, repand, ſmooth, rather glaucous underneath. *Flowers* fine azure blue, ſmall; peduncles axillary, ſolitary, divided at the ſummit into ſhort ramifications intermingled with ſmall bractes; calyxes deeply divided; ſegments acute. A native of South America. 69. C. *cymoſus*. Deſr. 64. Lam. 2063. (C. lævis minor; Rumph. Amb. 5. 451. tab. 158.) "Leaves heart-ſhaped, oblong, acuminate; peduncles cymous; fruit nodding." *Stems* long, ſlender, cylindrical, almoſt ſmooth. *Leaves* four or five inches long, alternate, petioled, nerved, even-ſurfaced, ſlightly ſinuated. *Peduncles* axillary, about the length of the petioles, branched about the middle into a cyme. *Calyx-leaves* egg-ſhaped, obtuſe. *Corollas* long, not very open. *Stigma* capitate, two lobed. A native of the Eaſt Indies. 70. C. *umbellatus*. Linn. Sp. Pl. 13. Mart. 18. Deſr. 63. Lam. 2062. Willd. 45. (C. luteus polyanthos; Plum. Am. 88. tab. 102. Sloan. Jam. 53.) "Leaves heart-ſhaped; petioles ſtipulaceous at the baſe; peduncles umbelled." *Root* perennial. *Stem* herbaceous, cylindrical, filiform, ſtiff, ſubdivided, pubeſcent. *Leaves* above two inches long, and as broad at the baſe, deeply heart-ſhaped, lanceolate, ſomewhat ſinuated, entire, dark green, hoary underneath; petioles three inches long, with two ſtipules at the baſe a little decurrent on the ſtem. *Flowers* yellow; peduncles three inches long or more; partial peduncles three quarters of an inch long, three-flowered; each flower on a pedicel longer than the partial peduncles; two of the calyx-leaves a little ſhorter than the reſt; ſtigma bifid, globular. *Capſule* two-celled. *Seeds* one or two in each cell, covered with a velvety down. A native of the Weſt Indies. 71. C. *multiflorus*. Mart. 69. "Leaves heart-ſhaped, ſmooth; peduncles many-flowered. *Seeds* villous, ferruginous. *Root* annual. *Stems* eight or ten feet high, ſlender. *Leaves* ſhaped like thoſe of C. ſepium. *Flowers* purple, on rather long peduncles, growing in bunches. *Capſules* trigonous, three-celled, with one ſeed in each cell. A native of Jamaica. Linnæus quotes Plukenet's Alm. tab. 167. 1. for the preceding ſpecies; Miller for the preſent. 72. C. *tuguriorum*. Mart. 73. Willd. 46. Forſt. Prod. 35. "Leaves cordate-arrow-ſhaped, acute; ſtem angular; peduncles tetragonal, one-flowered." A native of New-Zealand. 73. C. *buſalinus*. Mart. 77. Lour. Cochin. 109. "Stem ſhrubby; leaves cordate-arrow-ſhaped, ſmooth; peduncles many-flowered; anthers ſpiral." *Stem* large, ſhrubby, branched, ſmooth. *Leaves* alternate, petioled. *Flowers* yellow, large, campanulate; anthers filiform. *Capſule* two-celled, with one ſeed in each cell. A native of the woods of Cochinchina. 74. C. *cordifolius*. Willd. 47. Thunb. Prod. 35. "Leaves heart-ſhaped, haſtate, toothed; peduncles bifid-umbelled." A native of the Cape of Good Hope. 75. C. *roſeus*. Mart. 71. Houſt. MSS. "Leaves heart-ſhaped, acuminate; peduncles two-flowered." *Root* annual. *Stem* ſeven or eight feet high. *Leaves* on very long petioles. *Flowers* large, of a fine roſe colour, on long peduncles. *Seeds* large, covered with a fine down. A native of Jamaica, cultivated by Miller. 76. C. *bifidus*. Mart. 103. Willd. 48. Vahl. Symb. 3. 30. (C. lævis mas; Rumph. Amb. 5. 431.) "Leaves heart-ſhaped, oblong, acuminate, very ſoft underneath; peduncles bifid, many-flowered." β lævis minor; Rumph. 5. 431. tab. 158. "Leaves heart-ſhaped, lanceolate-oblong, ſmooth." *Stem* villous. *Leaves* from two to three inches long, an inch wide at the baſe, mucronate; petiole one-third of the length of the leaf, hoary. *Peduncles* axillary, ſolitary; pedicels numerous, ſomewhat umbellated, oblong, ferruginous, deciduous, with minute ſcales at the baſe inſtead of bractes. *Calyx-leaves* pubeſcent at the baſe, rounded at the tip, equal. *Corolla* almoſt funnel-ſhaped, three times the length of the calyx, with five ſlender villous lines on the outſide; lobes acute, bearded at the tip. *Stigma* capitate, two lobed. *Capſule* egg-ſhaped, ſtriated, ſmooth. It has the habit of C. umbellatus, but has ſmaller narrower leaves. The variety differs only in the ſmoothneſs, and its narrow leaves. 77. C. *malabaricus*. Linn. Sp. Pl. 14. Mart. 19. Deſr. 68. Lam. 2067. Willd. 49. (Katta-kelengu; Rheed. Mal. 11. 105. tab. 51.) "Leaves heart ſhaped, ſmooth; ſtem perennial, villous." *Root* perennial. *Stem* ſomewhat woody, cylindrical, weak, villous. *Leaves* alternate, acute, quite entire; petioles reddiſh, thicker than the ſtem. *Flowers* yellowiſh white, with a deep purple baſe; peduncles axillary, ſolitary, cylindrical; bractes narrow, ſituated near the calyx; calyx five-leaved; leaves acute, three outer ones larger; corolla campanulate, open, villous on the outſide; ſtigma capitate; two-lobed. A native of the coaſt of Malabar. 78. C. *cæleſtis*. Mart. 74. Lam. 2112. Willd. 50. Forſt. Flor. Auſt. 77. "Leaves heart-ſhaped, very acuminate, pubeſcent; peduncles elongated, umbellate-trifid" A native of the iſland of Tanna in the South Seas. 79. C. *canarienſis*. Linn. Sp. Pl. 15. Mart. 20. Deſr. 65. Lam. 2064. Willd. 51. Comm. Hort. 2. 101. tab. 51. Pluk. Alm. 114. tab. 325. fig. 1. "Leaves heart-ſhaped, acute, ſomewhat tomentous, ſoft; peduncles axillary, about three-flowered, rather long." *Root* perennial. *Stems* woody, twenty feet high or more, cylindrical, a little branched, woolly. *Leaves* alternate, not deciduous, whitiſh underneath, on ſhort tomentous petioles. *Flowers* purple-violet or pale blue, ſometimes white; peduncles axillary, longer than the petioles, tomentous; pedicels three, rarely five or ſix, ſhort, intermingled with filiform bractes; calyxes very villous, with five deep acute ſegments; corollas a little villous on the outſide; border almoſt flat; ſtigmas bifid, filiform. A native of the Canary Iſlands. 80. C. *pannifolius.* Saliſb. Par. Lond. tab. 20. "Stem angular; leaves haſtate-wedge-ſhaped, ſhaggy, with hairs on both ſides; peduncles two or three-flowered; tube of the corolla a line and half long; ſegments ſomewhat mucronate; pericarp tender, hairy." *Leaves* pale green, halberd-ſhaped, very hairy on both ſides, like a piece of woollen cloth. *Flowers* pale purple, with a darker baſe; bractes narrow, attenuated; calyx hairy; margin of the corolla and the wedge-ſhaped folds of its border pubeſcent; filaments white, covered with a glandular pubeſcence towards the bottom; anthers blue; nectary yellow, with a whitiſh margin; ſtyle white, about three lines long; ſtigmas white, longer than the ſtyle, ſpreading out wide, quite linear, obtuſe. *Capſule* two-celled. *Seeds* two in each cell. Raiſed from ſeeds received from Liſbon by Meſſrs. Lee and Kennedy. 81. C. *ferrugineus.* Willd. 52. Vahl. Eclog. 1. 17. "Ferruginous-downy; leaves heart-ſhaped, acute; peduncles axillary, four-flowered." *Root* perennial. A native of South America. 82. C. *muricatus.* Linn. Mant. 44. Mart. 21. Deſr. 73. Lam. 2072. Willd. 53. "Leaves heart-ſhaped; peduncles thickened, and, as well as the calyxes, even-ſurfaced; ſtem muricated." Reſembling C. purpureus, but the ſtem has a very even ſurface, with harmleſs prickles ſcattered over it. *Root* annual. *Flowers* purple; peduncles often two-flowered; corolla more funnel-ſhaped than that of C. purpureus. Diſtinct from ipomæa bona nox, A native of Surat; introduced into England by Dr. Solander; flowering in July and Auguſt. 83. C. *anceps.* Linn. Mant. 43. Mart. 22. Willd. 54. "Leaves heart-ſhaped; ſtem keeled on both ſides." *Stem* ſmooth, winged from leaf to leaf with two decurrent membranes. *Leaves* three inches long, ſmooth, veined, obtuſe, quite entire; petioles nearly the length of the leaf; peduncles axillary, the length of the petioles, thicker, four or five-flowered, villous; pedicels thickened, ſomewhat umbelled, villous; bractes two, at the baſe of the calyx, broad, egg-ſhaped, membranous, mucronate, villous, deciduous; two outer calyx-leaves egg-ſhaped, villous on the outſide, ſmooth within, mucronate; inner ones only half the ſize, oblong; corolla twice as long as the calyx, bell-ſhaped; ſtigma capitate. A native of Ceylon and Java. 84. C. *triqueter.* Mart. 104. Willd. 54. Vahl. Symb. 3. 30. "Leaves heart-ſhaped, acute, ſomewhat villous; peduncles many-flowered; ſtem three-keeled." *Stem* pubeſcent. *Leaves* two inches long and more; petiole villous, ſhorter than the leaf. *Peduncle* the length of the leaves, three or five-flowered; lateral pedicels often two-flowered; middle one one-flowered, ſhorter, gradually thickened; bractes at the baſe of the pedicels, egg-ſhaped, concave, tender, acute, mucronate, coloured, pubeſcent, deciduous; two outer calycine leaves reſembling bractes, egg-ſhaped, acute, mucronate, ſilky; inner ones ſhorter, ſmooth, rounded at the tip; ſtigma capitate. Nearly allied to the preceding, but the leaves are not obtuſe, and the rings on the ſtem much narrower. A native of the iſland of Santa Cruz. 85. C. *Turpethum.* Linn. Sp. Pl. 17. Mart. 23. Deſr. 86. Lam. 2084. Willd. 56. (Turpethum; Bauh. Pin. 149. C. zeylanicus alatus; Herm, Lugdb. 177. tab. 178, 179.) "Leaves heart-ſhaped, angular; ſtem membranous, quadrangular; peduncles many-flowered." *Root* perennial, about an inch thick, little branched, ſtriking deep into the ground, throwing out thick fleſhy tubers, abounding in a milky juice, which ſoon hardens into a reſinous ſubſtance when expoſed to the air. *Stems* woody and reddiſh near the bottom, ſlender, with four decurrent wings, branched. *Leaves* alternate, crenulate, ſoft, clothed with a thin whitiſh down, ſlightly mucronate; petioles ſhorter than the leaves, winged, channelled. *Flowers* white, reſembling thoſe of C. ſepium; peduncles longer than the petioles, axillary, ſolitary, trifid; pedicels one or two-flowered; bractes two, egg-ſhaped, at the baſe of the calyx; two outer calyx-leaves egg-ſhaped, villous; three inner ones ſmooth; anthers ſpiral; ſtigma capitate, two-lobed. *Capſule* membranous, globular-depreſſed, two-celled. *Seeds* one or two in each cell, black, angular on one ſide. A native of Malabar, Ceylon, the Society and Friendly Iſles, and the new Hebrides. For an account of the medicinal qualities of the root, ſee TURBITH. 86. C. *grandiflorus.* Linn. jun. Sup. 136. Mart. 24. Deſr. 14. Lam. 2013. Jacq. Hort. 3. tab. 69. (Munda-valli; Rheed. Mal. 11. 103. tab. 50.) "Leaves cordate-egg-ſhaped, rather obtuſe, quite entire; peduncles generally two-flowered; calyxes coriaceous; ſtem and petioles pubeſcent." Linn. jun. "Leaves heart-ſhaped, acute, on long petioles; peduncles ſhort, one-flowered; corollas very large, funnel-ſhaped." Lam. *Root* perennial. *Stem* woody at the baſe, cylindrical, branched, ſmooth, about twelve feet high. *Leaves* large, with rounded lobes, ſmooth. *Flowers* very white, ſweet-ſcented. A native of the Eaſt and Weſt Indies. 87. C. *ſpecioſus.* Linn. Sup. 137. Mart. 26. Willd. 58. (C. nervoſus; Deſr. 87. Lam. 2085. Burm. Ind. tab. 20. Samudra-ſtjogam; Rheed. Mal. 11. 125. tab. 61.) "Leaves heart-ſhaped, tomentous-ſilky underneath; peduncles longer than the petioles, umbelliferous; calyxes acute." Hort. Kew. *Root* perennial. *Stem* woody at the bottom, pubeſcent, branched; branches clothed with a thick white cottony down. *Leaves* alternate, large, acute, quite entire, nerved underneath; petioles and peduncles tomentous. *Flowers* purpliſh, more than two inches long; pedicels five or ſix, very ſhort; bractes elliptical, longer than the calyx; calyxes ſmall, deeply divided into five egg-ſhaped ſegments. A native of the Eaſt Indies. 88. C. *trinervius.* Mart. 27. Deſr. 16. Lam. 2015. Willd. 59. Thunb. Flor. Jap. 85. "Leaves heart-ſhaped, oblong, ſmooth, three nerved; ſtem cylindrical; peduncles one-flowered." *Stem* filiform, ſimple, ſmooth. *Leaves* about an inch long, oppoſite, acuminate, quite entire, paler underneath; petioles linear, ſmooth, half an inch long. *Flowers* purpliſh; peduncles axillary, ſolitary, or in pairs, very ſhort; ſegments of the calyx almoſt briſtle-ſhaped, ſmooth, half the length of the corolla; ſtigmas capitate, two-lobed. A native of Japan. Deſrouſſeaux obſerves, that the ſingularity of the oppoſite leaves renders the genus dubious. 89. C. *peltatus.* Linn. Sp. Pl. 16. Mart. 28. Deſr. 88. Lam. 2086. Willd. 60. Rumph. Am. 5. tab. 157. "Leaves target-ſhaped; peduncles many-flowered." *Stem*, according to Rumphius, ſometimes as thick as the human thigh, and climbing to the top of the higheſt trees. *Leaves* alternate, large, ſomewhat acute, ſmooth; petioles rather long, zig-zag. *Flowers* white or faint purple, bell-ſhaped, twice the length of the calyx; peduncles axillary, ſolitary; calyx-leaves egg-ſhaped, ſmooth. A native of Amboina. 90. C. *Jalapa.* Linn. Mant. 43. Mart. 29. Deſr. 13. Lam. 2112. Willd. 61. Woodv. Med. Bot. tab. 21. Lam. Ill. tab 104. fig. 2. (Bryonia mechoacana nigricans; Bauh. Pin. 298.) "Leaves egg-ſhaped, ſomewhat heart-ſhaped, obtuſe, obſoletely repand, villous underneath; peduncles one-flowered." Hort. Kew. *Root* perennial, thick, blackiſh on the outſide, whitiſh within, abounding in a milky juice. *Stems* numerous, herbaceous, ten or twelve feet high. *Leaves* ſmooth, different in ſhape, lower ones triangular, almoſt heart-ſhaped; upper ones more oblong and acute; petioles long. *Flowers* reddiſh on the outſide, dark purple within (yellow in the Kew Garden); peduncles axillary, ſolitary. *Seeds* covered with a very white cottony down. A native of South America, about Xalapa, between La Vera Cruz and Mexico. For its medicinal qualities, ſee JALAP. 91. C. *macroſpermus.* Willd. 62. (Mouroucoa violacea; Aubl. guian. 1. 142. tab. 54. Juſſ. 133.) "Leaves elliptical, acute, ſmooth; corollas flat; capſules two or three-celled, with one ſeed in each cell." *Root* perennial. *Flowers* ſalver-ſhaped. *Seeds* almoſt an inch and half thick. A native of Guiana. 92. C. *tenellus.* Willd. 63. Deſr. 78. Lam. 2076. Pluk. Almag. 114. Phyt. tab. 166. fig. 4. "Leaves oblong-elliptical, obtuſe, mucronate, nearly ſeſſile; peduncles longer than the leaf, generally two-flowered." One of the leaſt ſpecies of the genus. *Stem* filiform, a little villous. *Leaves* alternate, ſcarcely an inch long, and about three lines broad, entire. *Peduncles* axillary, ſolitary; bractes two, awl-ſhaped, at the baſe of the pedicels; corollas ſmall, bell-ſhaped. A native of Carolina and Virginia. 93. C. *Barbudenſis.* (C. glaber Mill. Mart. 68.) "Leaves ovate-oblong, ſmooth; peduncles one-flowered; calyxes ten-cleft." *Root* annual. *Stems* eight or ten feet high. *Flowers* purple, large, on long ſlender peduncles. Sent to Miller from the iſland of Barbuda. 94. C. *ſericeus.* Linn. Mant. 43. Deſr. 77. Lam. 2075. (C. mollis; Burm. Ind. 44. tab. 7.) "Leaves lanceolate-elliptical, tomentous-ſilky underneath; peduncles about three-flowered; calyx ſhort, hairy." *Stems* ſhrubby, ſmooth. *Leaves* alternate, petioled. *Peduncles* axillary, ſolitary, about the length of the petioles. Calyx-leaves egg-ſhaped, whitiſh, ſilky. Tube of the corolla narrow to the top of the calyx, afterwards widened and terminating in a purple border, covered on the outſide with white hairs. *Capſules* downy. A native of the iſland of Java. 95. C. *tomentoſus.* Linn. Sp. Pl. 18. Mart. 31. Deſr. 93. Lam. 2091. Willd. 65. Sloan. Jam. 55. hiſt. 1. 134. tab. 98. fig. 2. Pluk. alm. 115. tab. 167. fig. 4. "Leaves three-lobed, tomentous; ſtem lanuginous." *Stem* twenty feet high, cylindrical, whitiſh. *Leaves* alternate, reſembling the older leaves of ivy; petioles three quarters of an inch long. *Flowers* purple; peduncles axillary, ſolitary, many-flowered, a quarter of an inch long; corollas bell-ſhaped. *Capſule* ſpheroidal, acuminate, two-celled. *Seeds* one in each cell, black. A native of Jamaica. 96. C. *quinqueflorus.* Mart. 105. Willd. 66. Vahl. Symb. 3. 31. "Leaves ſagittate-egg-ſhaped, attenuated, ſmooth, crenate, ſomewhat repand; peduncles about five-flowered." *Stem* ſlightly pubeſcent, cylindrical, branched. *Leaves* tender, hoary; petiole ſhorter than the leaf. *Peduncles* the length of the leaves, pubeſcent. Pedicels in threes, umbelled, lateral ones in the greater number bifid, but on the peduncles near the top all ſimple, bractes two, linear, at the baſe of the lateral pedicels; calyx-leaves oblong, obtuſe, mucronate, ſomewhat villous; corolla twice as long as the calyx; lobes bearded at the tip; ſtigma bifid. Suppoſed to be a native of the iſle of Bourbon. 97. C. *crenatus.* Deſr. 74. Lam. 2073. Jacq. ic. rar. 2. tab. 315. (C. Hermanniæ; Willd. 67. L'Herit. ſtirp. 1. 67. tab. 33.) "Tomentous; leaves cordate-oblong, obtuſe, ſomewhat repand; peduncles longer than the petiole; border of the corolla acute." *β*. eroſus. "Leaves leſs elongated, appearing bitten here and there at the edge, cloathed with a reddiſh down; flowers larger." Whole plant whitiſh, ſoft to the touch. *Root* perennial, ſpindle-ſhaped. *Stems* about three feet long, not much branched. *Leaves* alternate, on ſhort petioles. *Flower* white, ſmall; peduncles long, zig-zag, with two ſmall awl-ſhaped bractes near the top, often two-flowered; border of the corolla ſlightly crenulate, with five acute diviſions. Found in Peru by Dombey. The variety *β* found at Monte Video by Commerſon. 98. C. *althæoides.* Linn. Sp. Pl. 19. Mart. 32. Deſ. 97. Lam. 2095. Willd. 69. Flor. Gr. tab. 194. Bauh. Pin. 295. Moris. hiſt. 2. 13. tab. 3. fig. 10. (C. peregrinus, folio betonicæ; Tourn. 85.) "Lower leaves heart-ſhaped, ſinuated; upper ones pinnatifid, ſomewhat palmate; peduncles generally two-flowered." Lam. *β*. C. Bryoniæfolius; Bot. Mag. 943. *Root* perennial. *Stems* a foot and half or two feet high, ſarmentous, weak, cylindrical. *Leaves* alternate. *Flowers* reddiſh, large, very open, almoſt entire; peduncles longer than the leaves, with two filiform bractes above the middle. The whole plant cloathed with numerous hairs, ſo as to give it a ſilky aſpect. A native of the Levant, Africa, and the South of Europe. The variety *β* is a much more robuſt plant; its leaves have no ſilkineſs or ſilvery whiteneſs; its flowers are larger and deeper coloured. Raiſed from ſeeds procured from China, by Iſaac Swainſton, eſq. in 1802. 99. C. *tenuiſſimus.* Smith Prod. Flor. Græc. p. 134. Fl. Græc. tab. 195. (C. althæoides *β*. Linn. *γ*. Deſr. C. althæoides; Bot. Mag. 359? C. argenteus elegantiſſimus foliis tenuiter inciſis; Tourn. Inſt. 85.) "Leaves pedate, ſilky, remarkably ſhining; linear lobes obtuſe; root-leaves cordate-ſerrated; peduncles one-flowered." Found by Dr. Sibthorp in Candia, about Athens and in the iſland of Zante. 100. C. *alceifolius.* Lam. 2096. "Hirſute; all the leaves deeply divided, ſomewhat palmate; peduncles few-flowered, longer than the leaves." A native of the Cape of Good Hope. 101. C. *cairicus.* Linn. Sp. Pl. 21? Mart. 33. Willd. 70. Bot. Mag. 699. (C. foliis lanceolatus vel quinquefolius; Bauh. Pin. 295. Barrel. icon. 319 and 320. C. ægyptius; Veſling Ægyp. 73. tab. 74. Ipomæa palmata; Forſk. Deſc. 43.) "Stem ſhrubby; leaves palmate-cleft, mucronate, ſmooth, quite entire, but often minutely crenate; hinder leaflets two-lobed: ſtipules palmate; calyxes even-ſurfaced; corollas ribbed underneath; diviſions acute." *Root* perennial. *Stem* with many ſlender branches. *Leaves* alternate; ſegments lanceolate; petioles the length of the leaves, with two leaf-like ſtipules at the baſe. *Flowers* violet-purple, large; peduncles the length of the petioles, axillary, from one to three-flowered; pedicels bracteated about the middle, with two ſmall, egg-ſhaped, acute ſcales; calyx five-leafed; leaves ſhort, egg-ſhaped, acute, concave, ſmooth, very ſhining either ſide; tube of the corolla nearly cylindrical, contracted as far as the calyx; border ſpreading; filaments unequal; anthers ſomewhat arrow-ſhaped: ſtigma divided into furrowed lobes. A common ornamental plant in the gardens of Egypt. 102. C. *quinquelobus.* Mart. 107. Willd. 71. Vahl. Symb. 3. 32. "Leaves palmate-quinquelobed, finely ſerrulated, obtuſe, ſmooth; axils tomentous; peduncles one-flowered; ſtem ſmooth." *Stem* cylindrical. *Leaves* nerved, finely veined, mucronate; middle lobe ſcarcely an inch long, lateral ones ſmaller, and narrower; petioles an inch long, filiform; ſtipules two, axillary, petioled, ſimilar in ſtructure to the leaves. *Flowers* purple; peduncles the length of the petioles, filiform, without bractes; calyx-leaves oblong, obtuſe, ſmooth; ſtigma capitate, two-lobed. A native of the iſland of Santa Cruz. 103. C. *copticus.* Linn. Mant. 559. Mart. 34. Willd. 72. (C. ſtipulatus; Deſr. 26. Lam. 2025. C. foliis laciniatis, vel quinquefolius; Bauh. Pin. 295. Barrel. icon. 319.) "Leaves pedate, ſerrated; peduncles enſiform, one or two-flowered; calyxes muricated." *Root* annual. *Stem* angular, ſmooth, and even-ſurfaced. *Leaves* ſmooth, deeply divided almoſt to the baſe; ſegments five, lanceolate, ſerrated or unequally toothed, mucronate by the middle nerve; lateral ones ſenſibly ſhorter; two external ones often bifid. Petioles long, channelled, ſcabrous underneath; ſtipules ſimilar to the leaves, but ſmaller. *Flowers* ſmall, white; peduncles axillary, compreſſed, longer than the petioles, thickened upwards, with two bractes above the middle. A native of the Levant. 104. C. *laciniatus*. Deſr. 27. Lam. 2026. "Leaves finely laciniated, ſomewhat bipinnated; peduncles one or two-flowered; calyx of the fruit nearly naked." About a foot and half high, ſometimes perfectly ſmooth, ſometimes cloathed with fine ſilky hairs. *Stems* ſlender, cylindrical. *Leaves* alternate, petioled. *Flowers* white; peduncles ſlender, longer than the petioles, axillary, ſolitary, thickened upwards; bractes two, about a line and half long, linear, acute, ſituated near the top of the peduncles; calyx-leaves egg-ſhaped, obtuſe, mucronate, a little ſcarious, ſometimes rather villous, eſpecially at the time of flowering; corollas campanulate, twice the length of the calyxes. *Seeds* black, naked. A native of South America, about Monte Video. Specimen in the herbarium of Commerſon. There is a variety in the herbarium of Thouin very villous in all its parts, eſpecially the calyxes, with the lower leaves leſs deeply divided, than the upper. 105. C. *vitifolius*. Linn. Mant. 203. Mart. 35. Deſr. 99. Lam. 2099. Willd. 73. Burm. Ind. 45. tab. 18. fig. 1. Pluk. alm. 135. tab. 25. fig. 3. "Leaves palmate-five-lobed, ſmooth, toothed; ſtem hairy; peduncles many-flowered." *Stems* villous. *Leaves* alternate, petioled, divided almoſt to the middle, hoary underneath. *Peduncles* axillary, ſolitary, hairy, ſeparating into two principal branches; calyxes villous; corollas campanulate, orange; ſtigmas two, globular. A native of the Eaſt Indies. 106. C. *diſſectus*. Linn. Mant. 204. Mart. 36. Deſr. 23. Lam. 2022. Willd. 74. Jacq. ob. 2. 4. tab. 28. Hort. 2. tab. 159. "Leaves palmate, ſeven-cleft, dentate-ſinuated, ſmooth; ſtem hairy; peduncles one-flowered." *Root* annual. *Stem* much branched, cylindrical. *Leaves* deeply palmate, almoſt digitate, ſegments acute; petioles from one to two inches long, hairy. *Flowers* white, open; peduncles ſhorter than the leaves, axillary, ſolitary, hairy at the baſe; calyx oblong, ſmooth and even-ſurfaced; ſtigma capitate, two-lobed. A native of America. 107. C. *mucronatus*. Mart. 75. Willd. 75. Forſt. prod. 79. "Leaves palmate-pedate; lobes ciliated, mucronate; peduncles one-flowered." A native of the Iſle of Tanna in the ſouth ſeas. 108. C. *macrocarpus*. Linn. Sp. 20. Mart. 37. Deſr. 24. Lam. 2023. Willd. 76. (C. polyphyllus, flore & fructu purpureis maximis; Plum. Cat. 1. MSS. 2. tab. 56. Burm. Amer. 8. 50. tab. 91. fig. 1.) "Leaves palmate, pedate, five-cleft; peduncles one-flowered." *Root* annual, thick, fleſhy, milky. *Stems* long, about the thickneſs of a gooſe-quill. *Leaves* deeply palmate, almoſt digitate, two outer ſegments leſs deeply divided, thin, ſmooth, on rather long petioles. *Flowers* purple; peduncles a little longer than the petioles, axillary, thickened upwards, jointed and bent above the middle, longitudinally winged and curled; calyx-leaves concave, roundiſh; corollas campanulate, large, ſlightly ſinuated. *Capſule* membranous, orbicular, angular, about the ſize of a walnut. *Seeds* round, black, villous, about the ſize of a hazel-nut. A native of Martinico, where its root is eſteemed purgative. 109. C. *paniculatus*. Linn. Sp. Pl. 23. Mart. 38. Deſr. 100. Lam. 2100. Willd. 77. (Pal modecca; Rheed. mal. 11. 101. tab. 49.) "Leaves palmate; lobes ſeven, egg-ſhaped, acute, quite entire; peduncled, panicled." *Root* perennial, about a foot and half long, thick, tuberous. *Stems* ſlender, even-ſurfaced. *Leaves* alternate, petioled, rarely three or five-lobed. *Flowers* very open, pale red on the outſide, purple within, deeper coloured at the bottom; peduncles axillary, ſolitary, reddiſh, a little curved; calyx-leaves rounded, appearing bliſtered, dull-red, connivent after the fall of the flower. A native of the coaſt of Malabar. 110. C. *palmatus*. Mart. 66. (C. pentaphyllos, folio glabro dentato, viticulis hirſutis, Plum. Cat. C. pentaphyllus β. ſerpens. Linn. "Leaves palmate; lobes ſeven, ſinuate-pointed; peduncles one-flowered; calyxes very large, ſpreading." Stem twenty feet high, dividing into ſeveral ſmaller ones. *Flowers* large, purple, on long peduncles. *Capſules* large, roundiſh, three-celled. *Seeds* one in each cell. A native of La Vera Cruz in New Spain, whence ſeeds were ſent to Miller by Dr. Houſton. 111. C. *aggregatus*. Mart. 78. Lour. Cochinch. 109. "Leaves palmate, ſeven-lobed, hairy; flowers aggregate." *Stem* perennial, cylindrical, extremely hairy, branched. Lobes of the leaves egg-ſhaped, rather acute, quite entire. *Flowers* white, large, on a long, ſolitary, axillary peduncle; common calyx (involucre?) twelve-leaved, bell-ſhaped; leaves ovate-oblong, unequal, hairy, containing about ten ſeſſile florets; proper calyx-leaves lanceolate, hairy, upright; corolla tubular, five-cleft; ſegments acute, hairy, cloſed; anthers bifid at the baſe; ſtyle longer than the corolla; ſtigma capitate. *Capſule* two-celled, two-ſeeded. Seeds round on one ſide, angular on the other. A native of Cochinchina. 112. C. *tuberculatus*. Deſr. 25. Lam. 2024. "Leaves digitate, ſomewhat pedate, ſeven-cleft, ſmooth; petioles rough with tubercles; peduncles one-flowered." *Stems* ſeveral, two or three feet high, ſlender, cylindrical, ſarmentous. *Leaves* alternate; ſegments egg-ſhaped, entire, lanceolate, ſlightly obtuſe, mucronate; petioles about two inches long, channelled, tubercled on their convex ſide, ſtipules digitate. *Flowers* large, purple; peduncles axillary, thickened upwards; furniſhed near the bottom with two ſmall glandular points, which riſe from a kind of knot; calyxes deeply divided; ſegments egg-ſhaped, obtuſe, ſomewhat ſcarious at the edges; corollas funnel-ſhaped, almoſt campanulate, very open; ſtigma two-lobed. Found in South America, about Monte Video, by Commerſon. Cultivated in the Botanic garden at Paris. 113. C. *macrorhizos*. Linn. Sp. Pl. 22. Mart. 39. Deſr. 106. Lam. 2107. Willd. 78. (C. coccineus heptaphyllus, radice craſſiſſima; Plum. Cat. 1. MSS. 2. tab. 58 Burm. Amer. 79. tab. 90. fig. 1.) "Leaves digitate in ſevens, quite entire; ſtem ſmooth; peduncles many-flowered." *Root* very thick, tuberous, ſweet-taſted, abounding in a milky juice, eſteemed purgative. *Stems* ſarmentous, deep green, about the ſize of a finger, branched, climbing to the top of the higheſt trees. *Leaves* on long purpliſh petioles, bright green; ſegments about three inches long, oval-lanceolate, acute, ſlightly ſinuated, ſmooth; mid-rib purple underneath. *Flowers* large, ſcarlet; peduncles axillary, ſolitary, ſhort, ſlender; corollas bell-ſhaped, tubular at the baſe; border open, ſlightly crenate; ſtigma capitate. A native of St. Domingo. 114 C. *pentaphyllus*. Linn. 24. Mart. 41. Deſr. 101. Lam. 2101. Willd. 82. (C. pentaphyllos hirſutus; Plum. Cat. 1. MSS. 2. tab. 54. C. americanus pent. & heptaphyllus major; Herm. lugbd 183. tab. 185. Tourn. 84. Ipomæa pentaphylla; Jacq. Col. 2. 297. ic. rar. 2. tab. 319.) "Very hairy; leaves digitate, in fives; leaflets egg-ſhaped, acuminate; peduncles many-flowered." Stems, petioles, peduncles, and calyxes rough with numerous long, ſtiff, reddiſh hairs. *Root* annual, long, ſlender, fibrous. *Stem* generally ſingle, ſometimes thirty-eight feet high, cylindrical, branched, about the ſize of the human little finger, cinereous brown, woody and ſmooth at the baſe, reddiſh above, green near the top. *Leaves* alternate, petioled; ſegments quite entire, cloathed on both ſides with fine decumbent hairs. *Flowers* yellowiſh white; peduncles about four inches long, axillary, ſolitary, cylindrical, dichotomous, often furniſhed with ſmall bractes under the diviſions; pedicels very ſhort; calyx-leaves acute, two outward ones longer, more hirſute, and of a purpliſh colour; corolla campanulate, twice the length of the calyx, ſlightly five-lobed; ſtigma capitate, two-lobed. *Capſule* two-celled. *Seeds* two in each cell. A native of South America, cultivated in the botanic garden at Paris. Miller received ſeeds from Carthagena in New Spain, which he cultivated under the name of C. pentaphyllus, and which differs from the above in being perennial, and having only two purple flowers on each peduncle. 115. C. *quinquefolius*. Linn. 25? Mart. 40. Deſr. 102. Lam. 2102. Willd. 79. Swartz. 63. Pluk. Alm. 116. tab. 167. fig. 6. "Leaves digitate, ſmooth, toothed; peduncles even-ſurfaced." Linn. "Leaves digitate, ſmooth, toothed; ſtem hiſpid; peduncles many-flowered." Lam. *Stems* very long, ſlender, cylindrical, hiſpid, branched. *Leaves* alternate, petioled, ſmooth, bright green; ſegments lanceolate; middle one largeſt, near two inches long, about half an inch broad. *Flowers* white; peduncles longer than the leaves, ſlender, axillary, ſolitary, ſomewhat villous, dichotomous, from three to ſix-flowered, with ſmall awl-ſhaped bractes at the diviſions; calyx ſmooth, ſegments oblong, the three inner ones larger; corollas campanulate, five-toothed. *Capſule* four-celled. Deſr. Two celled, two-ſeeded. Swartz. A native of the Weſt Indies. The C. quinquefolius of Miller ſeems a different plant. It was raiſed by him from ſeeds ſent from New Spain, and is thus deſcribed. *Stems* thirty feet high or more, woody, with a purple bark. *Leaves* deeply divided into five ſharp-pointed lobes. *Flowers* large, purple; peduncles long, thick, with a bent joint in the middle. *Capſules* round, as large as a middling apple, three-celled. *Seeds* two in each cell. 116. C. *ciſſoides*. Lam. Ill. 2103. "Hirſute; leaves digitate, in fives, toothed; peduncles about three-flowered, ſhorter than the leaf; calyx hiſpid. A native of Cayenne. 117. C. *venoſus*. Mart. 108. Deſr. 104. Lam. 2105. Willd. 80. Vahl. 3. 32. "Smooth: leaves digitate, in fives; leaflets petioled, ovate-acuminate; common peticles with tendrils at the baſe." Lam. "Quite ſmooth; leaves digitate, in fives, quite entire; peduncles many-flowered." Vahl. *Stems* ſlender, cylindrical. *Leaves* petioled; leaflets acute at the baſe (rather than petioled), veined; middle one larger than the others, about two inches long; (common petioles with a ſhorter tendril at the baſe. Deſr. Peduncles with an ovate-heart-ſhaped, acuminate, ſolitary leaf at the baſe. Vahl. Is it not properly a ſtipula, which, as the peduncles are axillary, may be thought by one obſerver to accompany the petiole: by another, the peduncle?) *Flowers* in a corymb; peduncles ſolitary, dichotomous near the top, with ſmall awl ſhaped bractes; calyxes ſhort; ſegments egg-ſhaped, two larger; corollas funnel-ſhaped, tube nearly of the ſame diameter throughout, not gradually enlarged to the top; border but little widened; ſtigmas capitate, ſlightly two-lobed. Sent by Commerſon from the Iſles of France and Bourbon. On a ſtrict compariſon it appears certain, that Deſrouſſeaux and Vahl have deſcribed the ſame plant, and have given it the ſame name, without any knowledge of each others ſpecimens. 118. C. *glaber*. Deſr. 103. Lam. 2104. Willd. 81. Aubl. guian. 138. tab. 53. "Leaves digitate, in fives; leaflets ovate-lanceolate, quite entire, ſmooth; peduncles many-flowered." *Stems* numerous, long, cylindrical, flexible. *Leaves* alternate. *Flowers* white; peduncles axillary, ſolitary; pedicels long; calyx deeply divided; ſegments long, firm, ſmooth, acute; tube of the corolla rather long; border open, with five rounded lobes; ſtigmas two, long, acute. A native of Cayenne. The whole plant is milky. 119. C. *erioſpermus*. Deſr. 105. Lam. 2106. "Shrubby; leaves digitate; leaflets about eight, linear, very narrow; ſeeds very hirſute." Whole plant, except the ſeeds, ſmooth. *Stems* ſarmentous, woody, cylindrical. *Leaves* about an inch long, including the petioles. *Flowers* purple, axillary, in ſmall dichotomous racemes, ſhorter than the leaves; calyx-leaves obtuſe, not a quarter of the length of the flowers; corollas cylindrical. *Capſules* egg-ſhaped, even-ſurfaced, twice the length of the calyx, four-valved, two-celled. *Seeds* two in each cell; covered on their convex ſide with numerous, long, decumbent, whitiſh, ſilky hairs, directed towards the baſe. A native of St. Domingo. 120. C. *tenuifolius*. Willd. 109. Vahl. Symb. 3. 33. "Leaves digitate, in fives; leaflets linear; peduncles four or five-flowered." Whole plant ſmooth. *Stem* angular. *Leaves* petioled; leaflets very narrow, entire. *Peduncles* axillary, ſhort; upper ones ſometimes one-flowered. *Calyx* ſmooth, with oblong leaflets; ſtigma acute.

*** Stems not twining.*

121. C. *ſiculus*. Linn. Sp. Pl. 26. Mart. 44. Deſr. 4. Lam. 2003. Willd. 84. Flor. Græc. tab. 194. (C. ſiculus minor, flore parvo auriculato; Bocc. Sic. 89. tab. 48. Tourn. Inſt. 83.) "Leaves cordate-egg-ſhaped; bractes lanceolate; peduncles longer than the petiole." *Root* annual. *Stems* one or two feet high, cylindrical, nearly ſimple, ſometimes a little twining, but generally not at all. *Leaves* entire, acute. *Flowers* ſmall, blueiſh; peduncles axillary, curved downwards near the top. A native of Sicily. 122. C. *patens*. Deſr. 33. Lam. 2031. "Filiform, ſomewhat erect; leaves linear, mucronate; peduncles ſpreading horizontally, longer than the leaf." Whole plant ſlightly villous. *Stems* about a foot and half high, very ſlender, little or not at all twining, cylindrical, ſomewhat branched. *Leaves* abont an inch long, ſcarcely two lines broad, alternate, almoſt ſeſſile, ſometimes one or two-toothed. *Flowers* on long, axillary, ſimple peduncles, with two egg-ſhaped lanceolate bractes a little below the calyx; calyx-leaves egg-ſhaped, acute, half the length of the corolla. A native of Carolina. 123. C. *pentapetaloides*. Mart. 45. Willd. 85. Vahl. 2. 36. "Leaves lanceolate, obtuſe, naked, linear; branches declining; flowers ſolitary, five-cleft half way down." Reſembling C. tricolor, but ſmaller. *Leaves* ſomewhat petioled. *Root* annual. *Flowers* axillary, on ſhort peduncles: bractes generally two obſcure ſcales. *Flowers* blueiſh, with a yellow bottom; ſegments acute. A native of Majorca, and the iſlands of the Archipelago. 124. C. *ciliatus*. Roth. Catal. Bot. 2. 22. Ann. Bot. 2. 12. "Leaves oblong, wedge-ſhaped, emarginate, ciliated; ſtem proſtrate; capſules very hairy." 125. C. *evolvuloides*. Smith Prod. Flor. Græc. 134. Desfont. Atlant. 1. 176. tab. 49. Flor. Græc. tab. 198. "Leaves ſpatule-ſhaped, obtuſe, hairy; upper ones embracing the ſtem; ſtem declining; flowers ſolitary, ſeſſile." *Root* annual. A native of Cyprus. 126. C. *lineatus*. Linn. Sp. Pl. 29. Mart. 46. Deſr. 53. Lam. 2052. Willd. 86. Flor. Græc. tab. 199. (C. argenteus anguſtifolius, umbellatus, partim erectus partim ſupinus; Tourn. Cor. 1. C. oleæfolius β; Deſr. C. marina repens; Bar. Rar. 3. tab. 1132.) "Leaves lanceolate, ſilky, linear, petioled; peduncles two-flowered; calyxes ſilky, ſomewhat foliaceous." Linn. "Tomentous-ſilky; leaves oblong, obtuſe, attenuated at the baſe, linear; peduncles two-flowered, ſhorter than the leaf." Lam. *Root* perennial, creep-

ing. *Stems* ſeveral, riſing among a conſiderable number of root-leaves, from three to ſix inches high, weak, zig-zag, ſlightly angular, villous, a little branched. *Leaves* alternate, ſeſſile, but ſo much narrowed at their lower extremity as to appear petioled, a little channelled at the baſe to embrace the ſtem, nerved; lower ones longer than the others, nearer together, reaching almoſt to the top of the ſtem. *Flowers* reddiſh; peduncles axillary, on the upper part of the ſtem, ſolitary, dichotomous near the top, and furniſhed at the diviſion with two bractes, reſembling the leaves in ſhape and ſilkineſs, and extending a little beyond the calyx; beſides theſe there are ſometimes two other ſmall linear bractes, ſhorter than the calyx; calyxes ſmall; leaflets egg-ſhaped, acute, ſilky; corollas middle-ſized, half-open, villous on the outſide. A native of the ſouth of France, and the Levant. 127. C. *ſpicæfolius.* Deſr. 41. Lam. 2039. Barr. Ic. 311. (C. non convolvulus; Mant. 29. tab. 140.) "Leaves linear-lanceolate, narrowed at the baſe, nearly ſimple; peduncles one-flowered, ſhorter than the leaf." *Stems* decumbent at the baſe, then aſcending, a little zig-zag. *Leaves* alternate, about three lines long, reſembling thoſe of lavender; lower ones the ſame length as the others. *Flower* rather large; peduncles axillary, ſcarcely half the length of the leaves; bractes two, linear-lanceolate, ſituated near the calyx, and a little ſurpaſſing it; calyx about one-third of the length of the corolla, with five acute ſegments; ſtigmas long, filiform. A native of mountains in Spain. Willdenow thinks this and the preceding the ſame plant; and they are perhaps nothing more than varieties; but as La Marck and Deſrouſſeaux profeſs to have ſeen both of them growing in the botanic garden at Paris, in deference to their authority we have kept them diſtinct. 128. C. *ſaxatilis.* Mart. 110. Willd. 87. Vahl. Symb. 3. 33. Bar. Ic. 470. Bocc. Muſ. 2. 79. tab. 70. (C. lanuginoſus; Deſr. 47. Lam. 2046. C. argenteus umbellatus ſupinus; Tourn. Inſt. 84. Lychnis ſylveſtris campanulæ flore; Bauh. Pin. 206.) "Very hirſute; leaves linear; flowers in terminal heads; calyxes acuminate." *Root* perennial. *Stems* ſcarcely a foot long, cylindrical, a little branched. *Leaves* about an inch long, thinly ſet, alternate, ſeſſile, ſatiny on the young ſhoots. *Flowers* white, with a ſlight tint of purple, ſeſſile, eight or ten collected into a head at the extremity of the branches, which are commonly without leaves below to the extent of two inches, ſurrounded with a ſort of involucre conſiſting of five or ſix rather broad leaves; each flower ſurrounded with ſome ſmall linear bractes; calyxes divided to the baſe into minute ſegments, half the length of the corolla. 129. C. *Cneorum.* Linn. Sp. Pl. 30. Mart. 47. Willd. 83. Flor. Græc. tab. 200. Bot. Mag. 459. (C. argenteus; Deſr. 48. Lam. 2047. C. argenteus umbellatus erectus; Tourn. Inſt. 84. Moriſ. Hiſt. 2. 11. tab. 3. fig. 1. Cneorum album, folio argenteo molli; Bauh. Pin. 463. Dorycnium; Cluſ. Hiſ. 2. 254.) "Leaves lanceolate, tomentous; flowers umbelled; calyxes hirſute; ſtem ſomewhat erect." Linn. "Shrubby, ſilky; leaves oblong, obtuſe; flowers in terminal, capitate umbels; calyx ſhort, ſomewhat retuſe." Lam. *Root* perennial. *Stems* about three feet high, cylindrical, firm, upright. *Leaves* numerous, ſcattered, about an inch and half long, four or five lines broad, ſeſſile, narrowed at the baſe, ſoft, clothed with a fine decumbent, ſilky, brilliant down. *Flowers* white, tinged with a pale red, on ſhort peduncles; bractes reſembling the leaves, but ſmaller; calyxes about a third of the length of the corolla, ſhort, obtuſe, deeply divided, villous; corolla ſilky on the outſide; border rather open. A native of Candia and the iſlands of the Levant. 130. C. *oleæfolius.* Deſr. 49. Lam. 2048. "Shrubby, ſilky; leaves linear-lanceolate; flowers in terminal capitate umbels; calyxes lanceolate." A native of the Levant; nearly allied to the preceding, and ſcarcely more than a variety. 131. C. *linearis.* Willd. 89. Bot. Mag. 289. "Stems erect, ſhrubby; leaves linear, acute, clothed with ſilky hairs; flowers terminal, umbellate-panicled; calyxes hairy." Confounded by the Engliſh nurſerymen with the next ſpecies. Moſt allied to C. cneorum, but differs in having leaves much narrower, more pointed, and leſs ſilky. 132. C. *cantabricus.* Linn. Sp. Pl. 31. Mart. 48. Deſr. 46. Lam. 2045. Willd. 90. Jacq. Flor. Auſt. 3. tab. 296. (C. linariæ folio; Bauh. Pin. 295. C. linariæ folio aſſurgens; Tourn. Inſt. 53. & humilior, 54.) "Leaves linear, acute; ſtem branched, ſomewhat dichotomous; calyxes hairy." Linn. "Hairy; leaves linear-lanceolate, acute; ſtem branched, rather erect; flowers cluſtered." Lam. *β.* C. terreſtris; Linn. Sp. 27. Whole plant clothed with fine whitiſh hairs, ſoft to the touch. *Root* perennial. *Stems* about a foot high, cylindrical. *Leaves* two or three lines broad, alternate, ſeſſile. *Flowers* roſe-coloured or white, almoſt ſeſſile, growing two or three together at the end of the ſtem and branches; bractes linear, acute, reſembling the leaves but ſmaller; calyxes with five acute ſegments; corollas middle-ſized, open, almoſt flat; ſtigmas two, filiform. A native of the ſouth of Europe. 133. C. *ſuffruticoſus.* Smith Prod. Flor. Græc. p. 135. Desfont. Atl. tab. 48. "Leaves linear-lanceolate; ſtem aſcending, villous; peduncles axillary, one-flowered, three times the length of the leaf." *Root* perennial. A native of Barbary and Greece. 134. C. *Ammanii.* Deſr. 40. Lam. 2038. (C. ramoſus, erectus, argenteus minimus; Amm. Ruth. 5. n. 6.) "Silky; leaves linear; peduncles one flowered; bractes long; calyx acute." Whole plant armed with a ſhort ſilky ſilvery down. *Root* perennial. *Stems* from four to ſix inches high, ſlender, cylindrical, branched, rather erect. *Leaves* alternate, ſeſſile; root-ones not leſs than half an inch long, narrowed at the baſe, obtuſe; thoſe on the ſtem and branches longer, acute. *Flowers* campanulate, pale white, ſtarred with purple lines; peduncles filiform, axillary, ſolitary, nearly the length of the leaves, furniſhed a little above the middle with two bractes ſeven or eight lines long, diſtinguiſhed from the leaves only by being oppoſite; calyx ſhort, with egg-ſhaped acute ſegments. A native of Siberia. 135. C. *piloſellæfolius.* Deſr. 45. Lam. 2044. Willd. 92. (C. orientalis, humifuſus, piloſellæ foliis; Tourn. Cor. 1.) "Leaves lanceolate, ſeſſile, entire; peduncles elongated, many-flowered, looſely branched." *Root* perennial. *Stems* cylindrical, ſlender, ſlightly hairy, decumbent. *Leaves* alternate, three or four lines broad; beſet, eſpecially at the edges, with long ſeparate hairs. *Flowers* ſmall, campanulate; peduncles from four to ſix-flowered; bractes oppoſite, ſmall, lanceolate like the leaves, ſituated at the baſe of the pedicels; calyx-leaves egg-ſhaped, acute, villous, half the length of the corolla. A native of the Levant. 136. C. *dorycnium.* Linn. Sp. Pl. 28. Mart. 49. Deſr. 38. Lam. 2036. Willd. 93. Flor. Græc. tab. 201. (C. ramoſus incanus, foliis piloſellæ; Tourn. Inſt. 84.) "Leaves almoſt linear, ſilky; ſtem ſhrubby, panicled; calyxes almoſt naked, obtuſe." *Root* perennial. *Stems* a foot and half high, cylindrical, almoſt ſmooth, a little zig-zag, much branched, with few leaves, eſpecially towards the top. *Leaves* alternate, ſeſſile, narrow. *Flowers* generally ſolitary, ſeſſile in the forks of the branches or at their ſummit, commonly accompanied with one or two ſmall leaves; calyxes very ſmall; corollas campanulate, open, villous on the outſide, three or four times the length of the calyxes. A native of the Levant. 137. C. *proliferus.* Willd. 34. Vahl. Eclog. 1. 18. "Leaves linear, ſilky underneath; heads of flowers terminal, and in the diviſions of the branches; bractes egg-ſhaped, very hirſute on the outſide. A native of South America. 138. C. *lanatus*. Mart. 80. Willd. 95. Vahl. Symb. 1. 16. Flor. Græc. tab. 202. (C. orientalis humilis argenteus latifolius erectus & villoſus; Tourn. Cor. 1. C. cneorum; Forſk. Ægyp. 63. n. 124. C. ſericeus; Burm. Ind. 49. tab. 19. fig. 3?) "Leaves lanceolate-linear, tomentous; old branches ſpinous; flowers capitate, involucred." *Stem* ſhrubby, erect, branched at the bottom; old branches leafleſs, barren; flowering branches from the baſe of the old ones, quite ſimple, ſeven inches long or more, erect, cylindrical, ſpineleſs, rigid, zig-zag towards the end, and covered with a ſoft ſhaggineſs. *Leaves* alternate; lower ones lanceolate, attenuated at the baſe, ſometimes ſeveral from the ſame point at the foot of the branches, unequal; upper ones lanceolate-linear, ſeſſile, acute; floral ones a little broader than the reſt; all thickiſh, veinleſs, tomentous, but not ſilky. *Flowers* campanulate, hairy on the outſide, the colour of C. cneorum; peduncles from almoſt all the axils, ſolitary, half the length of the leaf, from ſix to eight-flowered; pedicels none; involucre ſix-leaved, the length of the calyx; three outer leaflets egg-ſhaped, acute; three inner ones lanceolate; all of them, as well as the peduncles and calyxes, extremely hirſute, with long, very ſoft, ſhining hairs on the outſide, only ſomewhat hairy within. *Bractes* two beneath each flower; calyx-ſegments linear; ſtyle bifid; ſtigmas acute. A native of the Lower Egypt and of Mount Sinai. 139. C. *Hyſtrix*. Mart. 81. Willd. 96. Vahl. Symb. 1. 16. (C. ſpinoſus; Forſk. Arab. 106. n. 121.) "Shrubby; leaves oblong; flowers ſeſſile, almoſt always ſolitary; branches ſpineſcent." *Stem* rigid, much branched, diffuſe, a foot high; branchlets ſomewhat ſilky. *Leaves* ſeſſile, ſcattered, ſilky, entire, ſmall. *Flowers* ſmall, axillary, hirſute; bractes two, at the baſe of the calyx, oblong, rather acute, a little broader at the end and reflexed; two outer calyx-leaves oblong, rigid, larger than the others; ſtigmas two, capillary. A native of Arabia. 140. C. *ſpinoſus*. Linn. jun. Supp. 137. Deſr. 36. Lam. 2035. Willd. 97. (C. fruticoſus; Pall. It. 2. 734. tab. m.) "Shrubby, erect; leaves lanceolate, ſilky; flowering branchlets ſpinous." *Root* perennial. *Stem* ſhort, much branched. *Leaves* alternate, ſeſſile. *Flowers* vertical, ſeſſile; calyx-leaves egg-ſhaped, acuminate, concave, tomentous; three outer ones larger; corollas plaited, five-toothed, tomentous on the outſide of the tube, with a reddiſh border. A native of Ruſſia. 141. C. *ſcoparius*. Linn. jun. Sup. 135. Mart. 50. Deſr. 51. Lam. 2050. Willd. 98. "Leaves linear, ſomewhat hairy; peduncles about three-flowered; calyxes ſilky, egg-ſhaped, acute; ſtem ſhrubby; branches rod-like." The habit of a broom. *Root* perennial. *Stems* cylindrical, quite ſmooth; branches erect, ſimple. *Leaves* alternate, diſtant, ſhort, thin, upright. *Flowers* white, villous on the outſide; peduncles alternate, ſolitary, bracteate. A native of Africa and the Canary Iſlands. This ſpecies and C. floridus produce the true roſe-wood of the ſhops. Ventenat ſuſpects that theſe two may form a ſeparate genus, having a one-celled capſule, which opens at the baſe and contains a ſingle ſeed. 142. C. *ſecundus*. Deſr. 41. Lam. 2051. "Tomentous-ferruginous; leaves ſeſſile, lanceolate; heads of flowers thick-ſet, unilateral, nearly ſeſſile." *Stems* the ſize of a gooſe-quill, cylindrical, ſomewhat zig-zag, but little branched. *Leaves* about an inch long, alternate, cottony on both ſides, unilateral on the branches. *Flowers* five or ſix in a denſe head, on very ſhort peduncles, without pedicels, intermingled with bractes which reſemble the young leaves; corollas a little villous on the outſide. A native of Syria, obſerved by La Billardiere. 143. C. *Oenotheroides*. Linn. jun. Supp. 137. Mart. 51. Deſr. 34. Lam. 2032. Willd. 99. "Shrubby, erect; leaves linear, ſomewhat hoary; peduncles axillary, ſolitary, erect, one-flowered, bracteate; calyxes lanceolate, ſmooth." *Stems* erect, cylindrical, reddiſh, and ſomewhat glaucous. *Leaves* about three inches long, narrow, lax, flat. *Flowers* tawny; peduncles ſhort, angular; bractes two, recurved, awl-ſhaped; calyx-leaves quite ſmooth, rather ſpreading, hoary, membranous at the edges; corolla large, funnel-ſhaped. A native of the Cape of Good Hope, obſerved by Sparrman. 144. C. *floridus*. Linn. jun. Sup. 136. Mart. 52. Deſr. 50. Lam. 2049. Willd. 100. Jacq. ic. 1. tab. 34. "Leaves oblong-lanceolate, attenuated at the baſe, ſomewhat hairy; flowering branches and peduncles panicled." *Root* perennial. *Stems* about four feet high, woody, procumbent, ſmooth; branches ſlender, erect, ſtiff, hoary. *Leaves* three or four inches long, ſcattered, entire, on ſhort petioles. *Flowers* pale red or white, numerous, rather ſmall; peduncles axillary from the upper leaves, repeatedly branched, ſo as to form a large thyrſoid panicle; calyx-leaves egg-ſhaped, concave, acute. *Capſules* one-celled, one-ſeeded, opening from the bottom in ten valves. A native of the Canary Iſlands. 145. C. *cuneatus*. Willd. 101. "Stem ſhrubby, erect; leaves wedge-ſhaped, obtuſe, mucronate, ſmooth: corymbs axillary, ſhorter than the leaves." *Root* perennial. *Stem* cylindrical, ſmooth. *Leaves* two inches long, quite entire, beſet underneath with a few cloſe-preſſed hairs; petioles ſhort, villous on the inſide. *Flowers* purple; calyx-leaves obtuſe, hairy; corolla an inch long, tube ſwelling. A native of the Eaſt Indies. 146. C. *corymboſus*. Linn. Sp. Pl. 33. Mart. 53. Deſr. 62. Lam. 2061. Willd. 102. (C. niveus, polyanthus; Plum. Cat. 1. MSS. 2. tab. 50. Burm. Amer. tab. 89. fig. 2.) "Leaves heart-ſhaped: peduncles umbellated; ſtem creeping." *Stems* numerous, woody, the thickneſs of a gooſe-quill, with long branches. *Leaves* two or three inches long, alternate, petioled, fine green. *Flowers* a beautiful white, with ſtill whiter rays; peduncles ſlender, nearly the length of the leaves, with one or two bractes, forming a corymb. *Capſules* membranous, top-ſhaped, one-celled. *Seeds* two or three. Deſrouſſeaux deſcribes the ſtems as twining, on the authority, as we ſuppoſe, of Plumier's MSS. A native of the Weſt Indies. 147. C. *ſpithamæus*. Linn. Sp. 32. Mart. 54. Willd. 103. Gron. Virg. 141. (C. foliis cordatis pubeſcentibus incanis; Walt. Car. 93.) "Leaves heart-ſhaped, pubeſcent; ſtem erect; peduncles one-flowered." *Flowers* large, white. A native of Virginia. 148. C. *perſicus*. Linn. Sp. Pl. 34. Mart. 55. Deſr. 39. Lam. 2037. Willd. 104. Gmel. It. 3. 36. tab. 97. "Leaves egg-ſhaped, tomentous; peduncles one-flowered." Whole plant tomentous like the common mullein. *Root* perennial. *Stems* the ſize of a gooſe-quill, cylindrical. *Leaves* quite entire, obtuſe, on very ſhort petioles. *Flowers* white; peduncles axillary, ſolitary, the length of the leaves, with two egg-ſhaped bractes near the top; calyx-leaves egg-ſhaped; the three inner ones ſmaller; corolla campanulate, four times the length of the calyx; germ woolly; ſtigmas two, linear, thickiſh. A native of Perſia on the ſhores of the Caſpian Sea. 149. C. *tricolor*. Linn. Sp. Pl. 35. Mart. 56. Deſr. 35. Lam. 2033. Willd. 105. Bot. Mag. 27. (C. peregrinus cæruleus, folio oblongo; Bauh. Pin. 295. C. luſitanicus, flore cæruleo; Tourn. 83.) "Leaves lanceolate, egg-ſhaped, ſeſſile; lower ones ſomewhat ſpatulate; peduncles one-flowered; ſtem declining." *Root* annual. *Stems* about a foot long, cylindrical, weak. *Leaves* ſometimes ſmooth, often hairy, eſpecially when young. *Flowers* yellowiſh at the bottom, white in the middle and fine ſky-blue on the upper part of the border; peduncles juſt above the leaves on the ſame ſide about two inches long. A native of Spain, Portugal, Sicily, and the coaſt of Barbary. It is generally called C. minus by the Engliſh gardeners. 150. C. *acetoſellæfolius*. Willd. 106. Vahl. eclog. 1. 18. Plum. Amer. 9. tab. 105. "Leaves oblong-lanceolate, ſomewhat haſtate; peduncles elongated, one-flowered; ſtem creeping." *Root* perennial. A native of South America. 151. C. *repens*. Linn. Sp. Pl. 36. Mart. 57. Deſr. 30. Lam. 2029. Willd. 107. (Ipomæa aquatica; Forſk. Arab. 44. Ballel; Rheed. Mal. 11. 107. tab. 52.) "Leaves arrow-ſhaped, obtuſe behind; peduncles one or two-flowered." *Root* perennial. *Stem* creeping, jointed, rooting, angular, compreſſed, ſubdivided. *Leaves* crowded, terminal, emarginate, ſmooth, ſomewhat ſucculent, on longiſh petioles. *Flowers* whitiſh, rather large; peduncles from the axils of the terminal petioles, erect. A native of the Eaſt and Weſt Indies. 152. C. *reptans*. Linn. Sp. Pl. 37. Mart. 58. Deſr. 31. Willd. 108. (Olus vagum; Rumph. amb. 5. 419. tab. 155, fig. 1.) "Leaves haſtate-lanceolate; auricles rounded; ſtem creeping; peduncles one or two-flowered." *Root* perennial. *Stem* filiform, ſmooth and even. *Leaves* ſmooth, acuminate. *Flowers* pale purple; peduncles ſhorter than the petioles; calyx rounded. *Capſule* ſmooth, two-celled, with two ſeeds in each cell. A native of the Eaſt Indies, China, and Cochinchina, where it is uſed as a potherb. 153. C. *edulis*. Mart. 59. Deſr. 54. Lam. 2053. Willd. 109. Thunb. jap. 84. "Leaves heart-ſhaped, entire and three-lobed, ſmooth; ſtem creeping, angular." *Root* perennial, often as big as the human fiſt, tubercled, fleſhy like C. batatas, eſculent, ſoft, and ſapid. Said to be brought to Japan by the Portugueſe. 154. C. *hirtus*. Linn. Sp. Pl. 38. Mart. 60. Deſr. 83. Lam. 2081. "Leaves heart-ſhaped, ſomewhat haſtate, villous; ſtem and petioles hairy; peduncles many-flowered." *Root* annual; *Stem* a little twining. *Leaves* but little hairy. *Flowers* alternate, pedicelled, ſmooth, on peduncles longer than the leaves; involucres to each pedicel, very ſmall, lanceolate. A native of the Eaſt Indies. 155. C. *Soldanella*. Linn. Sp. Pl. 39. Mart. 61. Eng. Bot. 314. (C. maritimus noſtras rotundifolius; Tourn. 83. Soldanella maritima minor; Bauh. Pin. 295.) "Leaves kidney-ſhaped; peduncles one-flowered, with winged angles." Dr. Smith. *Root* perennial, long, creeping. *Stems* five or ſix inches long, procumbent, few-flowered. *Leaves* alternate, petioled, entire or a little angular, ſmooth and even, ſomewhat fleſhy. *Flowers* fleſh-coloured, yellowiſh at the plaits; peduncles axillary, ſolitary, rather erect, thickened near the top, quadrangular; bractes large, egg-ſhaped, cloſe to the flower; calyx-leaves large, egg-ſhaped. *Capſule* three-celled. *Seeds* black, one in each cell. A native of the ſea coaſts of Great Britain, and other parts of Europe. It abounds in a milky juice, which has a bitter, acrid, ſaline taſte, and is eſteemed a good purgative. 156. C. *Imperati*. Mart. 83. Willd. 112. Vahl Symb. 1. 17. (C. Stoloniferus; Deſr. 43. Lam. 2041. Cyril. Pl. rar. faſc. 1. 14. tab. 5. Soldanella vel braſſica maritima major; Bauh. Pin. 295. C. maritimus major italicus; Tourn. Inſt. 83.) "Leaves panduriform, or entire, emarginate, heart-ſhaped; peduncles one-flowered; corolla bell-ſhaped; ſtem creeping." Vahl. "Procumbent; leaves egg-ſhaped, retuſe, emarginate; lower ones undivided; upper ones ſinuate-lobed at the ſide." Lam. Nearly allied to the preceding. *Root* perennial. *Stem* cylindrical, quite ſmooth, a little branched, extending far on the ſand, rooting at the knots. *Leaves* alternate, ſmooth, ſhining, on long petioles. *Flowers* yellowiſh white; peduncles axillary, ſolitary, or in pairs, nearly the length of the petioles, with two ſmall bractes; calyx-leaves egg-ſhaped, obtuſe; ſtigma capitate. A native of the ſea-ſhore in Italy. 157. C. *arenarius*. Mart. 83. Lam. 2042. Willd. 63. Vahl. Symb. 1. 18. "Leaves oblong, emarginate, lobed at the baſe, or entire; peduncles one-flowered; corollas tubular." Whole plant ſmooth. *Stems* decumbent, filiform, zig-zag, purpliſh. *Leaves* cluſtered, veinleſs; petiole longer than the leaf. *Peduncles* in pairs or ſolitary, axillary, the length of the petioles; calyx-leaves equal, oblong, ſomewhat membranous; tube of the corolla enlarged gradually towards the top. A native of the Azores. 158. C. *maritimus*. Deſr. 44. Lam. 2043. Pluk. phyt. tab. 24. fig. 5. "Leaves emarginate, two-lobed, wedge-ſhaped at the baſe; peduncles many-flowered; ſtem decumbent, throwing out roots." Whole plant ſmooth. *Stems* cylindrical. *Leaves* alternate, mucronate by the elongation of the principal nerve, entire, thick, fleſhy; petioles channelled. *Flowers* purple, large, bell-ſhaped; peduncles from three to ſix-flowered, generally longer than the petioles, cylindrical, divided above the middle, and furniſhed at the diviſions with ſmall awl-ſhaped bractes; calyx-leaves egg-ſhaped, ſlightly mucronate. *Capſules* roundiſh. *Seeds* four A native of the Iſle of France, and of the Eaſt Indies. 159. C. *Pes capræ*. Linn. Sp. Pl. 40. Mart. 62. Willd. 113. (C. maritimus β.; Deſr. Lam. Ipomæa biloba; Forſk. C. maritimus zeylanicus; Herm. lugdb. 174. tab. 175. C. marinus; Rumph. Amb. 5. 433. tab. 159. C. maritimus ſive Soldanella è Maderaſpatan; Pluk. phyt. tab. 24. fig. 4. Schovanna-adambœ; Rheed. Mal. 11. 17. tab. 57.) "Leaves deeply emarginate, creſcent-ſhaped, truncate at the baſe; peduncles often one-flowered." *Root* annual. *Stem* ſomewhat ſhrubby, procumbent, creeping, a little villous, red. *Leaves* thick, tomentous. *Flowers* purpliſh. A native of the Eaſt Indies, China, Cochinchina, and the eaſtern coaſt of Africa. 160. C. *braſilienſis*. Linn. Sp. Pl. 41. Mart. 63. Willd. 114. (C. maritimus γ. Deſr. Lam. C. maritimus; Brown. Jam. C. marinus; Plum. Amer. 89. tab. 104. Marcgr. bras. 51. Piſ. braſ. 258.) "Leaves ſlightly emarginate, roundiſh, egg-ſhaped, often three-flowered." *Stems* perennial, and trailing to a great diſtance. *Leaves* larger than thoſe of the laſt two ſpecies; petioles marked near the leaf with two red ſpots. *Flowers* large, purple; peduncles long. *Capſules* large, three-celled. *Seeds* one in each cell. Whole plant milky and a ſtrong purgative. A native of the coaſt of Brazil, and of the Straits of Magellan. 161. C. *multifidus*. Willd. 115. Thunb. prod. 35. "Leaves palmate; lobes ſeven, linear, entire; peduncles one-flowered; ſtem decumbent." A native of the Cape of Good Hope. 162. C. *ſublobatus*. Linn. jun. Sup. 135. Deſr. 55. Lam. 2054. Willd. 116. "Stem procumbent; upper leaves repand-toothed at the tip; flowers capitate." *Root* annual. *Leaves* a little villous; lower ones heart-ſhaped; upper ones repand and almoſt lobed. *Flowers* aggregate, three together, ſeſſile, parallel, with a ſix-leaved involucrum. *Flowers* large. A native of the Eaſt Indies. 163. C. *capenſis*. Willd. 117. Thunb. prod. 35. "Leaves haſtate; lobes ſemibifid; peduncles about two-flowered; ſtem decumbent, villous." A native of the Cape of Good Hope. 164. C. *ſagittatus*. Willd. 118. Thunb. prod. 35. "Leaves haſtate and arrow-ſhaped; peduncles one-flowered; ſtems proſtrate." A native of the Cape of Good-Hope. 165. C. *littoralis*. Linn. Sp. Pl. 42. Mart. 65. Deſr. 28. Lam. 2027. Willd. 119. (C. albus, folio laciniato, maritimus, Plum. Cat. 1. Burm. Amer. 79. tab. 90. fig. 2. Tourn. 84.) "Leaves oblong, lobate-palmate; peduncles one-flowered; ſtem creeping." *Stems* very long, much branched, nearly the thickneſs of a gooſe-quill, white, tender, creeping and taking root. *Leaves* a little larger than the palm of the hand, palmate in the likeneſs of a duck's foot, fleſhy, tender, bright green, nerved, on longiſh petioles. *Flowers* large, white; peduncles axillary, ſolitary, rarely two-flowered, ſhorter than the leaves; corolla campanulate; border ſpreading, ſlightly cut. *Capſule* villous, ſilky white. A native of the Weſt Indies. 166. C. *martinicenſis.* Mart 42. Deſr. 29. Lam. 2028 Jacq. Amer. 26. tab. 17. pict. 19. tab. 24. "Leaves elliptical, ſmooth; peduncles one-flowered, longer than the leaf; ſtem creeping." *Stems* cylindrical, ſmooth *Leaves* alternate, obtuſe, mucronate by the projection of the middle nerve, entire, petioled. *Flowers* white; peduncles axillary, ſolitary, with two ſmall bractes near the top; three outer calyx-leaves large, egg-ſhaped, acute, lax; two inner ones ſmaller, lanceolate, acuminate. A native of Martinico.

Obſ. It is not eaſy, perhaps not poſſible, to draw a deciſive line of ſeparation between convolvulus and ipomæa. Tournefort attributed a bell ſhaped corolla to the former; and a funnel-ſhaped one to the latter, under the name of Quamoclit taken up from Cluſius, and of which he knew only one ſpecies; but theſe characters were ſoon abandoned. Linnæus, Schreber, Willdenow, and La Marck, have aſſigned a two-celled capſule and a bifid ſtigma to convolvulus, and a three-celled capſule to ipomæa, but this diſtinction has alſo been found inconvenient in practice. Gærtner places under convolvulus all the ſpecies which have a proper capſule, whatever be the number of its cells; and confines the genus ipomæa to ſuch as have a valveleſs berry, with four, or by abortion, two ſingle-ſeeded cells; a diſtinction which excludes all the ſpecies of the latter, except bona nox and zeylanica. Unable to come to a ſatisfactory determination amidſt this diſcordance of opinion, and unwilling to increaſe a genus already embarraſſingly large, we have made no alteration in the general diſtribution adopted by Linnæus and his followers: and have attempted to conſtruct the genuine and eſſential characters of convolvulus ſo as to include all the preſent received ſpecies.

Convolvulus, in *Rural Economy.* See Bind-weed and Weed.

CONVOLUTION, a winding or turning motion, proper to the trunks of ſome plants; as the *convolvuli,* or bind-weeds, and the claſpers of vines, and briony.

Dr. Grew thinks, that all thoſe plants whoſe roots are twiſted, have ſuch a *convolution:* and he aſſigns two great efficient cauſes of this winding motion, the ſun and the moon. It is very eaſy to try whether there be any ſuch convolution or not in the trunks of plants; which may be done, as he hints, by tying a little bit of paper to any of the branches which are exactly north, ſouth, &c. and then ſeeing whether it will change its poſition or not, in reſpect of the point of the compaſs.

CONVOY, from the French *convoyer, to conduct, eſcort;* in *Maritime Language,* ſignifies one or more veſſels of war, entruſted with the conduct of a fleet of merchants; ſerving as a watch, and a ſhelter from the inſults of the enemies of the ſtate to which they belong, or of pirates.

Convoy, in *Mechanics,* denotes a brake, gripe, or regulator for moderating the velocity of tram or rail-way waggons on ſteep parts of their deſcents: in ſome inſtances waggons heavily laden with coals, lime-ſtone, &c. deſcend for conſiderable diſtances on ſteep rail-ways, without horſes, and regulated only by a man who rides behind them aſtride upon the convoy; as from Whibſey-ſlack to the Bradford-canal in the Weſt-riding of Yorkſhire, and other places. Horſes are uſed to drag the empty waggons up the hill again. See our articles Canal and Rail-way.

On ſome rail-ways, where the trade is a deſcending one, and the declivity in ſome places 12 to 16 inches in a chain, the horſes, in holding back to moderate the velocity of the trams, are very liable to be thrown down and much injured, and even killed by the momentum of the trams; for obviating this evil, Mr. Charles Le Caan contrived a convoy, check, or ſtop, a model and deſcription of which he preſented to the Society of Arts in 1805, (ſee Tranſactions, Soc. Arts, xxiii. 316.) in which the convoy, in form of circular wedges, to act before the front wheels of the trams, is ſuſpended by chains from the ſhafts by which the horſe draws the tram, ſo as to cauſe no impediment to the motion of the wheels, as long as the horſe is on his legs, and the ſhafts nearly in an horizontal poſition; but in caſe of the horſe falling, and the ſhafts by that means declining downwards, the convoy inſtantly drops and ſtops the further progreſs of the wheels on the tram-plates; other kinds of convoys and ſlippers are deſcribed in our article Canal.

In 1805, Mr. F. D. Walker applied a ſimilar principle to that of Mr. Le Caan's convoy, to the ſhafts of a four-wheeled carriage called a ſociable; which convoy, on being let down by means of a pedal acted on by the coachman's foot, checked the motion of the four wheels in deſcending ſteep hills, and greatly ſecured the carriage and paſſengers from injury by runaway horſes: for two years this contrivance has been uſed with perfect ſucceſs by Mr. Walker, in frequently deſcending very ſteep hills, without locking the wheels.

Convoy, in *Military Language,* denotes ſome ſuccour or ſupply of men, money, ammunition, proviſions, ſtores, &c. conveyed in time of war by land or water, to a town or an army. A body of men, that marches to protect any thing, and prevent it from falling into the hands of an enemy, is alſo called a *convoy*. An officer, who has the command of a convoy, ſhould take all poſſible precautions for its ſecurity, and ſhould endeavour, before it marches, or ſets out, to procure good intelligence concerning the enemy's out-parties. And as the commanding officer of the place, from which the convoy is to ſet out, and thoſe of ſuch other places, by which it is to paſs, are the moſt proper perſons for him to apply to for aſſiſtance, he ſhould take ſuch meaſures as will enable him to keep up a conſtant intercourſe with them. The conducting of a convoy is one of the moſt important and moſt difficult of all military operations. The ſtrength of the detachment employed to eſcort a convoy ſhould have a reference to the importance of the convoy itſelf. For there are caſes when the eſcort ſhould be commanded by an able and experienced general.

When it may be neceſſary to paſs the night in the open fields, the cuſtom is to empark, that is, to form a cloſe with the waggons, for the troops to ſleep in, and this is a good precaution againſt any unexpected attempt of the enemy to ſurpriſe them. But if they ſhould find themſelves on the point of being attacked during the march, urgent neceſſity alone ſhould conſtrain them to adopt this method; and eſpecially the conſideration of their being very inferior to the enemy, ſince they would thus tie up their own hands and render it impoſſible for themſelves not to ſurrender, in caſe it ſhould happen that they were not ſeaſonably relieved. When the convoy is conſiderable; when it is to paſs between places in the hands of the enemy; and when it runs any riſk of being attacked; it ought to have a large eſcort, which is to be diſpoſed in ſuch a manner as to cover the convoy, inſtead of being covered by it. And as ſoon as the commanding officer hears of the enemy's being at hand, he is to leave a few detachments to accompany the waggons, and ſave them from ſuch of the enemy's parties as might attempt to turn them into a wrong road, or break their chain; and aſſembling the reſt of his troops, infantry as well as cavalry, ſeize the moſt favourable poſt within his power, to ſtop the enemy, or fight him, if he cannot avoid it. In the mean time, the convoy is to make the beſt of its way, and to get as far from the danger as poſſible. Should the troops, at any time, think it proper to cover themſelves with the waggons of a convoy, they ſhould be made to march in two columns, at a ſmall diſtance aſunder; and if the files ſhould prove too long in two columns, they muſt be formed into three or four. In this diſpoſition, which, however, the ground will not always allow of, as ſoon as the enemy is obſerved to be preparing for a ſerious attack, the horſes are to be immediately unharneſſed, and removed, not only that the waggons may be brought more cloſely together, ſo as to form a rampart, but to ſave the horſes, of which, otherwiſe, ſo many might be loſt, as to render it neceſſary, even after repulſing the enemy, to abandon part of the convoy. This muſt alſo be the caſe, if the troops ſhould be ſtopped, and obliged to fight in their march, as it would be impoſſible that ſeveral horſes ſhould not be maimed or killed. It appears, therefore, that, in order to ſave a convoy, the troops ſhould not think of covering themſelves with it. If at any time a retreat ſhould be neceſſary with a great number of baggage waggons, the retreating troops ſhould not think ſo much of the protection they might afford, as the embarraſſments they muſt create. The 10,000 Greeks rid themſelves of theirs; and, confining themſelves to ſome beaſts of burden, took the reſolution of fighting, uncovered. Moreover, regard ſhould be had to the country which the troops are to traverſe, and the kind of enemy with which they have to contend. If the country is an extenſive plain, and the enemy very ſtrong in cavalry, like the Turks, the waggons may prove of great ſervice; beſides thoſe for the baggage, which in caſes of neceſſity may be uſed for that purpoſe, the army ſhould provide itſelf with ſome of thoſe belonging to the inhabitants, to carry the chevaux-de-friſe, and the ſick and wounded.

Convoy, *Order of*, in *Naval Tactics*, denotes that which a fleet holds in making a ſtraight courſe; the ſhips being all in the wake of one another, ſteering on the ſame [illegible] of the compaſs, and forming a right line. This order, according to M. Bourdé de Villehuet, is the moſt ſimple, and the only one a fleet ought to be in at all times, for the following reaſons:—it is eaſily preſerved; it cannot be diſcompoſed in 20 out of the 32 ſhifts of wind, and is eaſily reformed in the 12 other changes; and it is eaſy to paſs from that order to thoſe that are proper for the ſecurity of a fleet, in all poſſible caſes, either to preſerve one's ſelf, to attack, or to defend. If the fleet be numerous, the ſhips are to be arranged parallel to one another, that of the admiral occupying the middle, and ſteering all three the ſame courſe.

To form the order of convoy in one line. When the fleet is in no particular order of ſailing, the leading ſhip is to veer ſufficiently for the others to get in her wake, and ſteer the ſame courſe ſhe holds. The commanding officer generally takes this poſt, when the ſquadron is not numerous. That the order may be the ſooner formed, every ſhip of the fleet or ſquadron ſhould chaſe at the ſame time that which is to be a-head of her in the line, taking care to manœuvre in ſuch a manner as to avoid running foul of thoſe which croſs her fore-foot in endeavouring to join their leaders in the line. Therefore, ſuch ſhips as are to leeward of others ſhould take care not to perſiſt obſtinately in weathering them; but they muſt back, or go a-ſtern if neceſſary, by keeping away a little more. Such as ſhould already be in the column, and are to be more a-ſtern, muſt bring to till they are in their poſts, or ſtand on under a very eaſy ſail, that each ſhip may contribute to the celerity of forming the order.

To form the order of convoy in three columns. The leaders of each of the three diviſions are to place themſelves in a line right a-breaſt of one another; and at a proper diſtance between themſelves, according to the length of the columns, which will accelerate the diſpoſition. Then every ſhip of each particular ſquadron, chaſing that which is to be next a-head of her, will come and take their ſtation a-ſtern of one another at the rear of the leading ſhip of the diviſion, and ſteer directly after her. This order, which in practice is eaſily maintained, has the advantage of keeping the fleet cloſe and connected, without cauſing any delay in its progreſs. The beſt ſailors can regulate their velocity by that of thoſe which are inferior to them in ſailing; and theſe, on the other hand, may, with a little attention, carry as much ſail as the weather will admit, by which means all imaginable courſes may, without breaking, be ſteered.

To change from the order of convoy, in one line, to the order of battle, continuing on the ſame tack. The headmoſt ſhip is to haul cloſe by the wind on the ſame tack, and the reſt of the fleet are to make the ſame movement in ſucceſſion, ſteering the proper diſtances from each other.

To change from the order of convoy, in one line, to that of battle on the other tack. The headmoſt ſhip is to veer and to come to the wind on the other tack; then all the veſſels of the fleet are to perform the ſame manœuvre in ſucceſſion. Otherwiſe, after having formed the order of battle on the ſame tack, as before, the van-ſhip is to tack; and all the ſhips of the fleet are to follow in ſucceſſion, to form the order of battle on the other tack. Or, if you are ſteering a courſe in the order of convoy, 4 points large, the order of battle on the other tack may be formed at once, by all the ſhips veering or ſtaying together.

To change from the order of convoy, in three columns, to the order of battle on the ſame tack. If the fleet has the wind on the beam, or between cloſe-hauled and eight points large, (See *Plate* I. *Naval Tactics*, *fig.* 1) the ſhips of the lee-column are all to bring to at the ſame time. The other two columns ſtand on. When the leader of the weather-column brings the lee leader to bear on the cloſe-hauled line, he tacks, and is followed in ſucceſſion. The centre-column does the ſame. But as the weather-column has a greater diſtance to run, it muſt make all poſſible ſail, while the centre-column need not make ſo much; becauſe the centre-column is not to begin to haul its wind till the centre-ſhip of the weather-column has got on the cloſe-hauled line. The lee-column is to follow in the ſame manner, when the centre-ſhip of the centre-column is cloſe by the wind.

If the wind be more than eight points, or right aft, (*fig.* 2.); the column which is to form the van-guard in the order of battle is inſtantly to haul its wind in ſucceſſion, with all ſails ſet; while the two others, continuing their courſe, will put themſelves ſucceſſively by the wind, on the cloſe-hauled line upon which the order of battle is to be formed, and conſequently in the wake of the weather-column.

If the columns be cloſe on a wind, it then becomes a caſe within the uſual fifth order of ſailing. See *Order of* SAILING.

To change from the order of convoy, in three columns, to the order of battle on the other tack. The fleet may be put firſt in order of battle, on the ſame tack; then, making the ſhips tack in ſucceſſion, they will be in order of battle on the other tack. But the time of evolution may be diminiſhed, (*fig.* 3.) by making the two weather-columns bring to, when ſailing between cloſe-hauled and eight points large, while the ſhips of the lee-column veer in ſucceſſion, and keep their wind on the other tack. The centre-ſhip of the lee-column having veered, the centre-column is to fill, the leader of which bears away, running exactly with the wind right-aft, and is followed in ſucceſſion by the ſhips of his diviſion, till they are in the wake of the lee-column, then on the other tack; when the leader of the centre-column hauls by the wind, the ſhips of his diviſion hauling in ſucceſſion. When the centre-ſhip of the centre-column has bore away, the weather ſquadron manœuvres in the ſame manner, and thereby completes the order of battle.

To change from the order of convoy to that of retreat. Whether the fleet be the order of convoy in one line or in three columns, they are firſt to form in the order of battle on the ſame tack; and thence they are to paſs to the order of retreat. See *Order of* SAILING.

To change from the order of battle to the order of convoy, in one line, on the ſame tack. The van-ſhip is to bear away as far as the intended courſe, and the reſt are to execute the ſame manœuvre in ſucceſſion; ſo that when the rear-ſhip ſhall have made the ſame movement, the evolution will be completed, and the order of convoy formed on the ſame tack.

To change from the order of battle to the order of convoy, in one line, on the other tack. The van-ſhip is to tack and run one point large, till ſhe can bear away, under the ſtern of the rear-ſhip, as far as the courſe which the fleet is to hold. All the ſhips are to perform the ſame manœuvre at the ſame points, to change the order and get upon the other tack. The van-ſhip, inſtead of tacking, may veer and run a little time before the wind, before getting on the other tack; then ſhe will heave to the wind on the fleet's courſe, without fear of breaking through the rear. This movement is ſhorter and preferable: ſince the order of convoy is never held to keep by the wind.

To change from the order of battle to the order of convoy, in three columns, on the ſame tack. The three leaders of the columns are to bear away together, and ſteer on the intended courſe; then the ſhips of each ſquadron are to execute the ſame manœuvre in ſucceſſion, following the ſame direction; ſo that the three rear-ſhips, veering at the ſame time in the wake of their reſpective columns, will compleat the evolution. The columns will find themſelves too diſtant from each other; but, as there is nothing which diſturbs them, and they have the wind right-aft or very large, it will be eaſy for them to cloſe as much as may be neceſſary.

To change from the line of battle to the order of convoy, in three columns, on the other tack. The three leading ſhips of the columns are to heave in ſtays at the ſame time, and bear away on the perpendicular of the wind on the other tack; then the ſhips of each ſquadron are to perform the ſame manœuvre in ſucceſſion; and when the rear-ſhips ſhall have turned about and be in a line with their reſpective columns, and the leaders of the weather-diviſions ſhall, by crowding all the ſails, have come a-breaſt of the van-ſhip of the lee ſquadron, the evolution will be compleated. If the fleet is to ſteer more large than the perpendicular to the wind, it will be eaſily formed, by making the leaders and their columns bear away in ſucceſſion, then putting afterwards the columns at the neceſſary diſtance from each other.

To change from the order of retreat to the order of convoy, in one line. One of the wings is to haul together cloſe by the wind, on the ſame tack as the line of bearing on which they are formed, in order to bear away in ſucceſſion at the point of the angle, in the wake of the other wing; the ſhips of which are to run with the wind four points large, on their line of bearing; and, when the laſt ſhip of the weather-wing is in the wake of her line, the order of convoy is formed. If it be neceſſary to ſail more large, or if you would not keep away ſo much, the ſame ſhips may keep their wind more, and follow the van-ſhip in ſucceſſion.

To change from the order of retreat to the order of convoy, in three columns. Firſt form the order of battle, and paſs from that to the order of convoy, in three columns.

To reſtore the order of convoy in one line, when the wind comes a-head more than cloſe-hauled. The order of convoy, it is plain, cannot be diſturbed by all the ſhifts of wind as long as it is more abaft than the ſtarboard and larboard lines of bearing; becauſe the ſhips, ſteering large in the wake of each other, can eaſily maintain their poſts, having only their ſails to trim, whether the fleet be in one line or in ſeveral columns. But if the wind draws more a-head than one of the lines above-mentioned, it is evident that the ſhips being obliged to veer, or pay off, all at the ſame time, on the ſame tack, the order will be diſturbed. In order to reſtore it on the ſame tack, when the fleet is in one line in the order of convoy; if we ſuppoſe the fleet ſteering large on the ſtarboard tack, and the wind comes ſuddenly right a-head, which would throw all the ſails flat a-back on their maſts, the van-ſhip is to caſt inſtantly to port, and bring to on the ſtarboard tack, while all the other ſhips of the fleet are to box off, together and at the ſame time, to ſtarboard, and make all ſail, in order to come with celerity cloſe by the wind on the larboard tack, and get into the wake of the van-ſhip, then to tack and take their ſtations ſucceſſively, under an eaſy ſail, and bringing to likewiſe till the rear-ſhip, which has a good way to run, be in her poſt. If you ſhould wiſh to get on the other tack, then the van-ſhip is to caſt to ſtarboard, to bring to on the larboard tack by the wind; then the reſt of the fleet would caſt the other way, to tack afterwards ſucceſſively in the wake of the ſhip which lies to, and take their ſtation there, as has been ſaid before, with this difference, that, after the reſtoring of the order, you would find yourſelf on the larboard tack. If the ſudden ſhift of wind be not quite a-head, or if it be ſix points, or between ſix and twelve, the van-ſhip is, nevertheleſs, to bring to on one tack, while the reſt of the fleet, caſting on the ſtarboard, make all ſail to gain her wake, to tack there, and thus regain their ſtations. The order of convoy may be reſtored by a ſhorter and more ſimple method, which, however, will cauſe the fleet to drop to leeward more than the former does. In the ſame caſe as the laſt, when the wind comes right a-head, the whole fleet is to pay off on the ſame tack, if the ſhips are all on one line, and the rear-ſhip muſt bring to, while the reſt of the ſhips running five points large (if the wind has ſhifted ſix points beyond the direction of cloſe-hauled), will come and bring to ſucceſſively a-head of the van-ſhip, on that line of bearing which they are to hold, obſerving that ſuch ſhips are to carry a greater and proportionable preſs of ſail, as, being nearer the van-ſhip, they have conſequently more way to run before they can regain their poſts. To know how many points or degrees the weather-ſhips have to run large to get into their ſtations, add eight points or 90 degrees to the half of the points or degrees the wind has ſhifted beyond one of the two lines of bearing; and, in regaining your poſts, you will have the number of points by which you differ from the firſt courſe you ſteered.

To reſtore the order of convoy, in three columns, when diſturbed by a ſudden ſhift of wind right a-head. In this caſe, the whole fleet muſt caſt the ſame way all together, leaving the three van-ſhips of the columns lying to, cloſe to the wind on the tack on which you purpoſe to continue cloſe-hauled, while the ſhips of the three columns running large all together on a courſe (to leeward of the firſt), which muſt always be determined by half the number of points or degrees the wind has ſhifted beyond the direction of cloſe-hauled, added to eight points or 90 degrees, will bear away with care for their ſtations in the cloſe-hauled line of bearing, which they are to hold to the windward ſide of their rear-ſhip, where they will arrive ſucceſſively, by carrying more ſail according as they may be nearer to the van, becauſe in that caſe they have a greater diſtance to run.

We ſhall cloſe this article with ſome remarks on *the convoy of merchant ſhips, under the protection of men of war.* For the due care of a large fleet, the convoy ſhould have a number of frigates, diſtributed a-head, a-ſtern, and on the wings of the fleet, which is always to be kept in the order of convoy, on three, four, five, or ſix columns, according to the number of which it is compoſed; ſome other frigates are alſo to be ſent on the look-out, to deſcry what paſſes at a diſtance, and to give timely warning of the approach of the enemy. If theſe ſhould diſcover an enemy of ſuperior force, they ſhould make it anſwer by ſignal; and it may be adviſable that they ſhould ſteer a different courſe from that of the fleet, in order to deceive the hoſtile ſhips in ſight. The men of war are to hold themſelves in the order of convoy a little a-head, and to windward of the weather-column of the fleet; becauſe they will then be able readily to attend wherever their preſence may be neceſſary; the frigates will, with alacrity and exactneſs, repeat their ſignals from one to another, that their purport may be expeditiouſly known to the commanding officer, who muſt not neglect to have all ſuſpected and neutral ſhips chaſed, and even ſtopped by the frigates, which are always to be ſupported by one or two line-of-battle ſhips, according to the exigency of circumſtances. The progreſs of the whole fleet will be regulated by that of the worſt going ſhips; which, however, are to be abandoned, when found to cauſe too great loſs of time; for to riſk a ſmall and partial loſs, is better than to expoſe the whole fleet by delay. Between the columns, there ſhould be ſloops of war and other ſwift ſailing light veſſels, to maintain order, and keep the ſhips in their ſtations. Their particular buſineſs will be to make the tardy ſhips to ſail with greater expedition, to oblige thoſe ſhips that are out of their poſt to reſume it, and in the evening to give an account to the frigates, having charge of going the round, of thoſe which have not manœuvred well; and theſe will make their report to the commodore.

During the night, the ſame order will be obſerved, except with reſpect to the look-out frigates, which are to be called in within a certain diſtance of the fleet, and which are to be allowed lights as well as the reſt of the men of war. They are to take ſpecial care to oblige all ſtraggling ſhips to return to the convoy, and to fire, without heſitation, on all ſtrange veſſels coming from the main ſea, in order to give the alarm. Every night they are to be ſupported on the wings by ſome line-of-battle ſhips. Elements and Practice of Rigging and Seamanſhip, vol. ii. pt. 2.

CONUS, in *Conchology*, a genus in the Linnæan ſyſtem, diſtinguiſhed by that writer as having the ſhell univalve, convoluted, and turbinated; aperture effuſe, longitudinal, linear, without teeth, and entire at the baſe; pillar ſmooth. Animal a limax.

Species.

* Section *truncati*, ſpire nearly truncated.

Marmoreus. Shell conic, brown with ovate white ſpots; whorls of the ſpire canaliculated. Linn.

Inhabits the Aſiatic and American ſeas, and comprehends ſeveral diſtinct varieties. The ſhell is finely ſtriated, and varies from fulvous to blackiſh; the ſpots are often of triangular ſhape, and running into bands; whorls emarginate, and armed with ſpinous tubercles.

Imperialis. Shell whitiſh with longitudinal livid bands, and narrow belts compoſed of brown and white. Linn. *Kroonhoorn*, Rumpf. *Corona imperialis*, Argenv.

A ſcarce ſpecies. The ſhell is generally marked with two yellowiſh bands. Suppoſed to be from the Eaſt Indies.

Litteratus. Shell conic, white with brown dots. Linn. *Voluta muſicalis*, Rumpf.

Inhabits the Aſiatic ocean, and varies from white to rediſh, or yellowiſh; the ſpots or dots are uſually of a ſomewhat quadrangular form diſpoſed in rows, between which are a few pale yellow bands or cheſnut coloured lines; the ſpire is ſtriped with brown.

Generalis. Shell conic, poliſhed, ſpire flat and muricated; whorls canaliculated. Gmel.

A native of India. The colour of this ſhell varies from brown to yellow or orange, and is encircled with two, three, or four bands, marked with elongated ſpots; ſpire whitiſh, varied with undulated ſtripes, and pointed in the middle.

Virgo. Shell conic, with the baſe bluiſh. Linn.

Several varieties of this African ſpecies are deſcribed by Knorr, Liſter, and Chemnitz, from which it appears this ſhell varies from white to yellow, or yellowiſh, and is ſometimes teſſellated with white and red, or white with a ſtraw-coloured band; ſpire blue, or white marked with an ochraceous band.

Capitaneus. Shell conic, glabrous, with the baſe brown; ſpire a little convex. Linn.

Few diſtinct varieties of this ſpecies are deſcribed by Gualtieri, Bonanni, Favanne, and other writers. It is a native of Africa, and is commonly either of an olive, brown, or cheſnut, or varied with thoſe colours, and marked with one or two white bands, undulated ſpots, and numerous rows of dots; ſpire in general ſtriped. This is an Aſiatic ſhell.

Tribunus. Shell white, with three yellowiſh bands, ſpotted with cheſnut; ſpire a little convex; and the baſe tranverſely ſtriated. Gmel.

Deſcribed on the authority of Martini, who has given a figure of it in his work on Conchology; its native country is unknown. The ſhell is marked with a few waved cheſnut lines.

Miles. Shell conic, rough, with the baſe brown; ſpire convex. Gmel. *Pſeudo-arebithalaſſus*, Argenv.

This ſhell is a native of India, and is of a white or yellowiſh colour, with longitudinal undulated lines, the baſe tranſverſely ſtriated, near the ſpire a brown band, the ſpire itſelf ſpotted with brown.

Cingulum. Shell conic, yellowiſh, with a ſingle elevated belt in the middle; ſpire acute. Gmel.

Inhabits the Friendly Iſles.

** Section *Pyriformes*, &c. Pyriform with a rounded baſe, the cylinder half as long again as the ſpire.

Princeps. Shell yellow, with purpliſh-brown longitudinal ramoſe lines. Linn.

Length of this ſhell about two inches and a half; the ſpire is obtuſe and finely ſtriated tranſverſely; the body marked with two white bands which have a few brown ſpots, the reſt of the ſhell ſpotted with cheſnut. Inhabits the Indies.

Ammiralis. Shell with rough punctures at the baſe. Linn.

The varieties of this ſpecies, according to the character aſſigned it by Linnæus, are numerous beyond example in any other ſhell, amounting to nearly forty diſtinct kinds, independently of a much greater number not hitherto well defined. Among the principal varieties the following are moſt intereſting.

Larvatus, faſciis nullis, &c. Without bands, figured by Martini.

Americanus, with irregular bands, and admitting of ſeveral varieties, as thoſe having the ſhell brown, and clouded or ſpotted with white. Shell reticulated and clouded with cheſnut; white, ſpotted, dotted, and clouded with brown; white, having the bands marked with orange lines. Another ſtrong variety *anglicus*, figured in the work of Gualtieri, is of a red colour marked with numerous punctured white belts, and has the ſpire ſpotted with brown. The variety *coronatus*, deſcribed by Argenville, is diſtinguiſhed by a belt of reddiſh dots, and tranſverſe elevated lines, and is ſometimes marked with a yellow band in the middle, and numerous punctured belts; or ſometimes brown with a white band, and an oblique row of whitiſh ſpots. *Regius* has two bands, which are generally of an orange colour with darker lines, the interſtices white; ſhell with orange dots and undulated ſpots. Martini figures a variety of this kind, the ſhell of which is white with waved brown ſpots, and the bands varied white and brown; another has the bands yellowiſh with trifarious brown lines, and the ſhell white ſtriated with brown; and a third variety has the ſhell clouded white and brown, and the bands of a brown colour. In *ordinarius* the ſhell is teſtaceous ſpotted with white, the bands white, and ſomewhat reticulated with an articulated belt in the middle. *Guineenſis* has the ſhell of a ſtraw colour, the middle band marked with angulated lines in a very beautiful manner. The ſhell of the variety *ſurinamenſis* is of a bay colour with numerous dotted belts, the bands ſpotted and the lower one dotted with brown and white. This kind includes ſeveral inferior varieties. The variety *ſummus* has the ſhell of a ferruginous colour with ſcattered white ſpots, and is marked with yellow bands, very finely reticulated; it varies in the number of the regular bands. *Occidentalis* is another ſtrong variety; the ſhell teſtaceous ſpotted with white, and an articulated belt; bands yellow and reticulated. The laſt and principal variety of the conus princeps is the *cedo nulli*, a ſhell found in the South Seas in amazing variety, ſome kinds of which are however extremely beautiful and rare, and in high eſteem with amateurs. The *geographic* cedo-nulli is a fine and valuable kind, the prevailing colour of which is white, marbled with orange in a map-like manner. Another kind, called the "king of the ſouth," (*Roi du Sud*, Argenv.) is of a fine deep golden orange with a white belt, and ſeveral diſtinct circles compoſed of clear white ſpots, three of which circles are diſpoſed between the belt and the ſpire. Before the revolution in France there were three ſpecimens of this kind known in the cabinets of Paris; one in that of Madame la Preſidente de Banderille, another in that of the king, and the third, ſuperior in perfection to either, in the poſſeſſion of M. le Comte de la Tour d'Auvergne, which laſt was obtained from the Iſle of France, and was known by the title of *Le Cedo-nulli aux iſles*. But the *banded cedo-nulli* bears the higheſt value. This ſhell, called by the French *cedo-nulli a bandes*, or by ſome more emphatically *la reine du midi*, is better known in England by the name of Lyonet's cedo-nulli; it was formerly treaſured in the cabinet of that diſtinguiſhed amateur, and eſtimated at a conſiderable price, the ſum of one hundred pounds ſterling being actually refuſed by its poſſeſſor, who was nevertheleſs diſpoſed to part with it at a fair valuation. Lyonet was an ingenious naturaliſt reſident at the Hague, and, according to popular report, obtained this ſhell from the cabinet of M. de la Faille, auditor of finances to the ſtates general of Holland, at the death of that eminent collector.

A particular account of this curious ſhell is given by Argenville, who pronounces it unique; this author deſcribes it from a drawing made under the immediate inſpection of Lyonet, the original of which we have ſeen, and are ſatisfied in the accuracy of his deſcription. The ſhell from this drawing appears to be very elegant; its ſize is about that of the other varieties of the cedo-nulli, which vary from an inch and an half to an inch and three quarters in length, and meaſure rather more than three quarters of an inch in the wideſt part. The colour is yellow, divided by four diſtinct bands of marbled white, the one of which acroſs the middle of the ſhell, and another next the baſe of the ſpire, are the broadeſt and moſt beautifully variegated: the ſpire itſelf is faſciated longitudinally. At the firſt glance the yellow appears two principal bands of pretty conſiderable breadth, one above and the other below the band of marbled white which encircles the middle of the ſhell. The two laſt-mentioned yellow bands are beſet with four equi-diſtant tranſverſe ſtriæ of little prominent dots, which give the ſhell in this part a ſlightly ſcabrous appearance.

It is only in conformity with popular report, that the ſhell of Lyonet, as before intimated, is preſumed to be the celebrated cedo-nulli of La Faille's cabinet, the truth of which has been conteſted by reſpectable authority. Favanne thinks it is not the ſame, and Gerſaint poſitively declares it is not. The individual ſhell of ſo much repute in the collection of La Faille, according to the latter writers, was ſold at the ſame time, with the other articles, at the Hague, about the year 1728, and was bought by a dealer for the king of Portugal's cabinet, at a price exceeding a thouſand French livres. Hence it is imagined that Lyonet procured his famous ſhell from ſome other ſource. If we are not miſtaken in our information, there were originally two ſhells of this ſame kind in the cabinet of La Faille, who preſented Lyonet with one of them, and which, if true, at once reſolves the myſtery. The fate of Lyonet's ſhell is not exactly known; it is believed, at preſent, to enrich one of the Pariſian muſeums.

We ſhall laſtly mention a variety of the cedo-nulli, formerly in the rich cabinet of Madame de Bandeville, called *le cedo-nulli marbré*, from the beautiful variegated or marble-like appearance of its colours, which were blueiſh and violet on a ground of white. The ſhell was alſo embelliſhed with three yellowiſh zones, and beſet with a number of little roundiſh granulations of a white colour encircled with red.

VICARIUS. Shell teſtaceous, ſpotted with white, with four yellow immaculate bands, the ſecond divided angularly. Gmel. *Archithalaſſus ſecundus*, Argenv.

Said to inhabit the ſouthern ocean.

SENATOR. Shell conic, ſmooth, glabrous with obtuſe ſculptured whorls. Martini.

Native place unknown; the ſhell is yellow ſpotted with white, and marked with very numerous tranſverſe ſtriæ, compoſed of white and brown dots.

NOBILIS. Shell ſub-cylindrical, ſmooth and glabrous. Linn. *Tigris lutea*, Argenv.

This ſpecies is finely poliſhed, of a yellow or brown colour, occaſionally ſhaded with olivaceous, ſpotted with white, and marked with very minutely punctured tranſverſe ſtriæ.

GENUANUS. Shell with linear belts articulated with white and brown. Linn. *Geneſeſche toot*, Rumpf. *Jamar*, Adanſ.

Found on the ſhores of Guinea. The ſhell is red, with bands alternately teſſelated with brown and red. The "*A la papilionis*" of Argenville, called alſo by Engliſh collectors the butterfly cone, is conſidered as a variety of this ſpecies.

GLAUCUS. Shell emarginate at the baſe, and ſtriated; ſpire unarmed, with the whorls contiguous. Linn. Botervegie van Boer. Rumpf.

A native of India and Africa. The ſhell is varied with brown, cheſnut, and red ſpots, ſometimes placed in rows, and the ſpire, which is tranſverſely ſtriated, varies in being more or leſs convex, and marked with ſpots, which are ſometimes ſquare.

MONACHUS. Shell gibbous, clouded with blueiſh brown, acute, and ſtriated at the baſe. Linn. *Capucinus ſ. anicula*, Rumpf.

Suppoſed to be a native of India. Shell ſometimes marked with dots diſpoſed in rows.

MINIMUS. Shell greyiſh, ſurrounded with oblong dots. Linn.

Delineated in the works of Martini and Knorr; the native country unknown.

RUSTICUS. Shell ovate, rugged, and muricated at the baſe; the ſpire conico-convex. Linn.

There are two varieties of this ſpecies, one of which, *voluta cinerea* of Rumpfius, is without any band, the other has a band, clouded with whitiſh, and is varied with blackiſh lines and dots. This ſhell inhabits Africa.

MERCATOR. Shell ovate and white, with reticulate yellow bands. Linn. *Tilin*, Adans.

Inhabits the ſhores of Africa. Shell of moderate ſize, ſometimes yellowiſh, with brown or tawny bands.

BETULINUS. Shell ſlightly emarginate at the baſe, and wrinkled; the ſpire flattiſh and mucronated. Linn.

This is a native of India; the ſhell is rather large, and admits of ſeveral varieties, being either yellow or ochraceous, with teſſelated ſpotted bands, and intermediate lines of yellow or brown; white, with three rows of violet characters; or white faſciated, ſpotted and dotted with brown. The *Conus Meduſæ* of Martini is eſteemed a variety of this ſpecies.

FIGULINUS. Shell ſlightly emarginated at the baſe, and wrinkled; ſpire acuminated, with flattiſh whorls. Linn. *Voluta fuoſa*, Rumpf.

Length about three inches; brown, ferruginous, or yellow, and rarely olive, with darker lines; within generally whitiſh. A variety deſcribed by Knorr is of a more elongated form, the colour orange, with darker lines, and two yellowiſh bands; the ſpire reddiſh, ſpotted with black. Inhabits India.

EBRÆUS. Shell ovate and white, with black bands, compoſed of tranſverſe ſpots. Linn. *Muſica ruſticorum*, Rumpf. *Hebraica*, Argenv. *Coupet*, Adans.

Native of the ſame country as the laſt. Shell rather ſmall, and ſometimes reddiſh, with parallelogramatic ſpots, which are often cheſnut. There are ſeveral varieties of this ſpecies. It is known by the name of the Hebrew character cone, among Engliſh collectors.

STERCUS MUSCARUM. Shell emarginate at the baſe, and ſtriated; whorls of the ſpire canaliculated. Linn. *Voluta arcuata*, Rumpf.

Inhabits Aſia. This ſhell is of a long and narrow form, and white colour, with ſcattered black or red ſpots, which are ſometimes united into bands; whorls of the ſpire obtuſe, and in ſome of its varieties tuberculated.

VARIUS. Shell elongated and muricated, with the ſpire coronated and acute. Linn.

A native of the Indian ocean. The ſhell is white, clouded with brown or yellow, and granulated ſtriæ diſpoſed over the whole ſurface.

ACHATINUS. Shell elongated, very finely ſtriated tranſverſely, and variouſly clouded and ſpotted with white; ſpire ſhort, ſpotted with brown, and red at the tip. Gmel.

Several varieties of this ſhell are deſcribed by Seba and Chemnitz; the ſpecies is a native of the American ocean.

RADIATUS. Shell radiated and faſciated with white. Gmel.

Native country unknown; the ſhell is brown, pale yellow, or cinereous, and is figured by Martini.

LEONINUS. Shell with pale yellow or cheſnut ſpots; commonly marked tranſverſely with white or yellow bands, compoſed of grains or ſpots. Linn.

Found in the Indian ocean; and is a ſpecies comprehending an amazing number of varieties, as may be ſeen by the works of Knorr, Martini, Seba, Chemnitz, and others; about fourteen diſtinct varieties are aſcertained.

JASPIDEUS. Shell light olive, with multifarious white dots, and an oblique band. Martini.

This is a ſhell of an oblong form, and ſmall ſize. The native place is uncertain.

NEBULOSUS. Shell brown clouded with blue, and white ſpots. Gmel. Bonanni, &c. A doubtful ſpecies; the country unknown.

Coffeæ. Shell ſhort, brown, with two white bands; that neareſt the ſpire ſpotted with brown. Martini.

Shell of moderate ſize; country undetermined.

Amadis. Shell pale brown, with a broad band, and articulated belts above and beneath; ſpire acute, crowned with tubercles, and very finely ſtriated tranſverſely. Argenv. Zoomorph. Country unknown; ſhell varies in being more or leſs ventricoſe.

Fulmineus. Spire acute, and with the pillar-lip ſpotted with cheſnut; ſhell ſtriped longitudinally with cheſnut; baſe acute, and ſtriated obliquely. Martini.

Arachnoideus. Shell reticulated with cheſnut, with two or three darker bands; ſpire coronated and acute. Argenv. Zoomorph.

Deſcribed as an extremely rare ſhell, and probably not of this tribe. Its native place is unknown.

Costatus. Shell brown, with a white band, undulated with reddiſh, with thick and broad ſtriæ; ſpire nodulous, with a granulated band. Gualt. Country unknown.

Leucostictus. Shell white, clouded, ſtriped, and ſpotted with brown, and marked with numerous rows of white and brown dots; ſpire crowned with tubercles. Gmel.

Inhabits the Indian ocean; and has the ſpire of the ſhell ſometimes acute.

Citrinus. Shell citron colour, with black lines interrupted beneath; ſpire crowned with tubercles, and with the baſe white. Gmel. Inhabits the Caraccas.

Insularis. Shell white, with cheſnut clouds, ſpots, and dots; and ſpire acute. Gmel. Country unknown.

Coronatus. Shell with alternate articulate belts, and teſſellated ſpots; ſpire crowned with tubercles. Gmel.

A ſmall and extremely variable ſpecies, and which is oftentimes marked with a white band. Its country is unknown.

Punctatus. Shell with two yellowiſh-brown bands, and numerous lines of dots; ſpire varied with yellow dots and lines. Knorr.

Zeylanicus. Shell ſnowy, with roſy and brown clouds, and numerous articulated belts, varied with white and cheſnut: ſpire pointed. Martini. The baſe of this ſpecies is grooved obliquely.

Solidus. Shell conic, thick, tranſverſely ſtriated, clouded with white and brown, with a broad white band, and pyramidal ſpire; the whorls canaliculated. Chemn.

*** Section *elongati*, &c. Elongated and rounded at the baſe; the cylinder twice the length of the ſpire.

Clavus. Shell with convex ſmooth ſtriæ; the baſe blueiſh. Gmel.

An extremely rare ſpecies, found in the Indian Ocean. The ſhell is long, yellow, with white ſpots, and two deeper bands ſpotted with white; the ſpire ſpotted, and gradually tapering to an obtuſe point.

Nussatella. Shell ſomewhat cylindrical, red, not crowned with tubercles, rough, with tuberculated ſtriæ. Gmel. *Terebellum granulatum*, Rumpf.

This is a ſcarce ſpecies, and inhabits the iſland Nuſſatello in Aſia. The ſhell is pale, clouded, and ſpotted with red, or rarely entirely white; with yellowiſh-brown, granulated, tranſverſe ſtriæ; and the ſpire ending in an obtuſe point.

Terebellum. Shell white, ſhaded with blue, ſubcylindrical, with annulated ſtriæ, and yellow bands. Gmel. Inhabits the Indian ſeas.

Fusus. Shell fuſiform, white tranſverſely ſtriated. Gmel. Martini, &c.

Coccineus. Shell red, with tranſverſe lines dotted with black, with a white band and ſpire, ſpotted with red. Gmel., Knorr, &c.

Caetus. Shell ſomewhat cylindrical, with annulated ribs, red, with darker clouds, and bars of white; ſpire ſpotted. Gmel.

Figured by Liſter and Knorr, and is ſuppoſed to be a variety only of C. *granulatus*. Its country is unknown.

Granulatus. Shell rough, unarmed; ſtriæ ſmooth and grooved. Linn. *Voluta granulata*, Rumpf.

Inhabits the African ocean. Shell red, with large ſulcations, faſciated with white and purple linear dots.

Ochroleucus. Shell ſub-cylindrical, yellow; the baſe obliquely ſtriated with a contiguous white band; ſpire pointed, and marked with ſtriped ſpots. Gmel.

The native country is unknown. A variety of it is found of a cheſnut colour, varied with decuſſating ſtriæ, dotted with red.

Laevis. Shell rufous, with fulvous ſpots, and tranſverſe ſtriæ; ſpire ſpotted with yellow; baſe obliquely ſtriated. Gmel., Valent. &c.

Affinis. Shell blueiſh-white, with four fulvous linear bands, and intermediate dull purple dots or marks. Martini.

Violaceus. Shell white, clouded and banded with violet; rays pale brown. Martini.

Polyzonias. Shell white within; externally yellowiſh-brown, and rough, with very fine granulated lines; white band at the ſpire, denticulated beneath; another at the baſe paler, and numerous filiform bands. Born.

Bifasciatus. Shell white, with angular cheſnut lines, and two orange bands; ſpire prominent; baſe ſurrounded with orange lines, and intermediate teſſellated ſpots. Born.

Niveus. Shell conic and ſnowy; ſpire prominent and coronated; aperture large. Born.

Arausiacus. Shell not crowned, ſmooth, with whitiſh bands; whorls grooved at the tips. Gmel. *Oranjen admiraal*, Rumpf.

A beautiful and rare ſpecies found in India. The colour is in general whitiſh, with two or three orange bands, and white lines, teſſellated with brown ſpots; ſpire with oblong ſpots of red, white, and brown.

Magus. Shell ſub-cylindrical, with longitudinal bands dotted with white. Linn. *Voluta maculoſa*, Rumpf.

A native of India. Shell white, with dotted lines, and oblong, cheſnut, yellow, and brown ſpots; ſpire acute and ſpotted.

Striatus. Shell ovate-oblong, gibbous, clouded, with very fine parallel brown ſtriæ. Linn. *Voluta tigerina*, Rumpf. *Melar*, Adans.

Common upon the coaſt of Africa. Shell four inches long, ſnowy, with ſometimes reddiſh or yellowiſh ſtriæ; the baſe emarginate and tranſverſely ſtriated.

Textile. Shell reticulated, with yellow veins, and ſpotted with yellow and brown. Linn. *Pannus aureus*, Argenv. *Leman*, Adans.

A native of Aſia. Chemnitz deſcribes a variety of this ſpecies, of a white colour, with three orange bands; and another of a bloom colour, with two darker bands.

Aulicus. Shell white, with brown reticular veins, and interrupted longitudinal bands. Linn. *Nigella*, Argenv.

Nearly allied to the former, and ſuppoſed by ſome to be a variety: it likewiſe inhabits Aſia, and admits of many varieties, ſeveral of which are figured by Martini.

Thomæ. Shell ſmooth, white, with bay characters, and rows of dots, and three white belts and ſpots; tip reddiſh; ſpire conic, with grooved whorls. Gmel.

A native of the Indian ſeas.

**** Section. Shell ventricoſe in the middle, and narrow at each end.

Sinensis. Yellow, ocellated with white, and tranſverſely ſtriated at the baſe. Gmel., Regenſ., &c.

***** Section. Shell ventricoſe, and tinkling when thrown down on its back.

Spectrum. Shell blueiſh, with yellow clouds, and yellowiſh-white dots and ſtriæ. Linn. *Voluta ſpectrorum*, Rumpf.

Inhabits the Aſiatic ſeas. Four diſtinct varieties are figured by Chemnitz.

Cullatus. Shell yellow, clouded with white. Linn. *Potan*, Adans.

Native country unknown. Shell thin, often ſpotted, clouded, or barred, and more or leſs ventricoſe; aperture large and blueiſh; ſpire ſometimes flat, ſometimes acute.

Tulipa. Shell oblong, gibbous, ſmooth; aperture gaping. Gmel. *Tulipa*, Argenv.

Inhabits India, Africa, and South America. Shell not coronated with tubercles; white, with a few clouds of blueiſh, brown, yellow, or red, and interrupted lines; aperture blueiſh; baſe obſoletely ſtriated obliquely; ſpire acute, ſmooth, ſpotted, and finely ſtriated tranſverſely.

Geographicus. Shell oblong, gibbous, and coronated; aperture gaping. Gmel. *Nubecula*, Rumpf. *Textile ſericum*, Argenv. *Nubecula*, *tulipa gallorum*, Klein. *Salar*, Adans.

A rare ſpecies found in the Indian and African ſeas. The ſhell is of a ſomewhat cylindrical form, wrinkled at the baſe, and rather narrower, pellucid, white; ſpotted and clouded with brown; aperture white; ſpire ſometimes roſy.

Nubecula. Shell white, clouded and ſpotted with orange, and ſcattered white dots; ſpire prominent and acute. Linn.

Spurius. Shell white, with alternate rows of irregular cheſnut or blackiſh ſpots, and interrupted punctured bands. Gmel., Gualt.

Vexillum. Shell brown, ſhaded with white, and marked with an interrupted white band. Rumpf., &c.

Ventricosus. Shell brown, barred with white, beneath narrower, ſhaded with blueiſh, and ſmooth; ſpire conic and exſerted. Kaemm. Country unknown.

CONUSANCE, in *Law*, See Cognizance.

CONUSOR. See Cognisor.

CONVULSIONS, in *Pathology*, from *convello*, *I rend* or *tear*, conſiſt in violent, involuntary, and preternatural contraction and motion of the muſcular fibres, in any part of the body.

By modern phyſicians, convulſions have been divided into two claſſes, under the terms of tonic and clonic, or *ſpaſtici* and *agitatorii*, according as the contractions are rigid, not alternating with relaxation, or throw the muſcles into a ſtate of conſtant motion, being immediately ſucceeded by relaxation, and again returning, alternately. Theſe two ſpecies of morbid contraction of the muſcles are generally diſtinguiſhed at preſent by the terms, *ſpaſm*, which denotes the fixed contraction, and *convulſion*, which implies the preternatural motion. The term σπασμὸς, *ſpaſm*, was applied, however, by the Greek phyſicians, to the convulſive motions; and the rigid contraction was denominated τέτανος, *tetanus*. "Frigus modo nervorum diſtentionem, modo rigorem inſert; illud σπασμὸς, hoc τέτανος Græcè nominatur." Celſus de Med. lib. ii. cap. 1. The word *nervus* ſignified a tendon, as well as an elongation of the brain and ſpinal marrow, which is now excluſively called a nerve: hence the Roman name for convulſions, which ſignifies diſtention of the tendons. And accordingly, thoſe ſlighter convulſive motions of the muſcles of the arms, which occur in fever, and occaſion a playing of the tendons under the finger of a perſon, feeling the pulſe, are now called a ſtarting of the tendons, *ſubſultus tendinum*. But theſe different forms of ſpaſm and convulſion are frequently mixed, or paſs into each other; and ſimilar cauſes, affecting the brain and nervous ſyſtem, produce both the one and the other.

It were vain to attempt to give an explanation of the nature or proximate cauſe of convulſive motions; ſince we are ignorant of the nature of the nervous power, or of that medium by which the muſcles are connected with the common ſenſorium, and the volition of the mind is communicated to the muſcles. We muſt be content with the obſervation of facts: the minute operations of nature are inſcrutable. The mechanical phyſicians had, indeed, no difficulty in accounting for the morbid, as well as the healthy operations of the nervous ſyſtem: their imagination furniſhed them with a cauſe for every effect. Thus they *ſuppoſed*, like the natural philoſophers, the exiſtence of a ſubtile, ætherial fluid, the motions and vibrations of which produced all the effects which they obſerved. By farther ſuppoſition, different phyſiologiſts explained the mode in which this gratuitous fluid operated. Borelli fancied that there might be oblong veſicles in the fibres of the nerves and muſcles, which were rendered ſpherical by the force of the nervous fluid, and therefore ſhorter. Others imagined that the influx of the nervous fluid ſeparated the parallel fibres of the muſcles from each other, and thus ſhortened the length of the whole. But it were uſeleſs to enumerate the various futile hypotheſes, which originated in an erroneous philoſophy. All that we know on this ſubject is, that ſome of the muſcles of the body contract, in a ſtate of health, by the will of the mind, as thoſe of the trunk and extremities:—others, apparently without the intervention of an act of volition, although ſubject in a great meaſure to the will, in conſequence of a local ſenſation; as the diaphragm, and the other muſcles of reſpiration; the eyelids, in nictitation, &c.:—and others, again, are excited to contraction, altogether independently of the will, by an irritation ſo obſcure, as to excite no perception in the mind; as the heart, which continues its unperceived motions, in conſequence of the irritation or ſtimulus of the diſtending blood, which is returned into its cavities by the veins. The contractions, produced by one or other of theſe cauſes, are regular in force and velocity, according to the degree of excitement; are always ſoon ſucceeded by a ſtate of relaxation; and are not repeated, except when the will or the irritations again operate. In the morbid or convulſive ſtate, the contractions of the muſcles, ordinarily depending on the will, are excited without the concurrence of the will, or in a way contrary to what the will intends; and in the other inſtances, they are excited diſproportionately to the action of the uſual and natural irritations. Hence it may be concluded, without any gratuitous hypotheſis, that when theſe convulſive motions are excited, independent of, or in oppoſition to, the will, ſome change in the condition of the ſeat of volition, the brain, and its elongations, the nerves, has occurred; and, if the convulſions are partial, that ſome great local irritation has been applied.

Now, although it be confeſſed that the actual condition of the brain, which occaſions convulſions of the moving fibres, be unknown, as well as its condition and mode of operation in health; yet certain conditions of the body, in general, have been obſerved to be connected with the occurrence of convulſions, which lead to a knowledge of the ſtate of the brain in the groſs, and ſerve as valuable guides in our practice in theſe diſeaſes.

Convulſions have been chiefly obſerved to occur, when the body was in a ſtate of repletion, inanition, or great irritation. It may ſeem inexplicable, that the two oppoſite conditions of repletion and inanition ſhould give riſe to ſimilar morbid appearances; but the knowledge of the fact, which is eſtabliſhed beyond a doubt, is ſufficient for our practical purpoſes. We ſhall illuſtrate the operation of each of theſe ſtates in producing convulſive diſeaſes.

1. *Repletion* of the ſyſtem at large, or of the brain in particular, is a ſtate in which convulſions frequently occur. Numerous inſtances are on record, in which epilepſy has occurred, where a general plethoric ſtate of the conſtitution was preſent. Epileptic convulſions have ſometimes ſucceeded apoplexy, which is known to originate in overturgeſcence of the brain. Every occaſional fulneſs, or unuſual impulſe of the blood into the veſſels of the brain, ſuch as from a fit of anger, the heat of the ſun, or of a warm chamber, violent exerciſe, a ſurfeit, or a fit of drunkenneſs, are frequently the immediate exciting cauſes of convulſions. (Cullen. Firſt Lines, § 1296.) Hence alſo, in inflammatory fevers, as in the eruptive fever of the ſmall-pox, where the blood is carried to the brain more abundantly, and with greater impetus than in health, convulſions are frequently produced; eſpecially where the circulation is hurried by a hot regimen. The ſuppreſſion of accuſtomed diſcharges, or the omiſſion of habitual evacuations, have alſo been the occaſion of convulſive affections, in conſequence of the general plethora which enſues. But the moſt marked and ſtriking inſtance of convulſions, induced by repletion, occurs in the puerperal ſtate. They generally come on in the early ſtage of labour, and are attended with fulneſs and diſtention of the features, and other obvious marks of determination of blood to the head; they ſpeedily ceaſe when the delivery is accompliſhed, if they do not prove fatal before that takes place; and copious blood-letting is the only effectual remedy. In all thoſe inſtances, indeed, which have juſt been mentioned, the good effects of evacuating medicines, of a ſpare diet, and cool regimen, in removing the diſeaſes; and the bad conſequences which have enſued, under the employment of an oppoſite treatment, point out repletion as the cauſe of the miſchief. This is, alſo, ſtill more clearly aſcertained from the diſſection of thoſe, who have died in conſequence of convulſions, occurring under ſuch circumſtances; marks of a congeſtion in the brain having been generally obſerved. See EPILEPSY.

2. *Inanition* is a frequent cauſe of convulſions. It has been obſerved from the earlieſt ages, that convulſions invariably precede death, when it is occaſioned by loſs of blood; and the fact is daily exemplified in ſlaughter-houſes, when animals are killed by opening the large blood veſſels. Hippocrates ſtates, in his Aphoriſms, Sect. v. Aph. 3, that convulſions, or hiccough (which is, in fact, a convulſion of the diaphragm), ſucceeding a great hæmorrhage, are dangerous, and he repeats the obſervation in Sect. vii. Aph. 9. From this cauſe convulſions ſometimes occur in the puerperal ſtate, where great hæmorrhage from the uterus has occurred. But in ſuch inſtances, the countenance, ſo far from being fluſhed, with a fulneſs of the features, is pallid, and the features are ſharp and ſunk; there are cold ſweats, and other ſymptoms of exhauſtion, which mark the diſtinction between this ſort of convulſive diſorder, and the proper puerperal convulſions, mentioned under the former head. In theſe convulſions from inanition, the contrary remedies, cordials, and powerful ſtimulants, largely and frequently adminiſtered, afford the only means of ſaving life. "Si fluxui muliebri," ſays Hippocrates, "animi deliquium et convulſio ſupervenit, malum." Sect. v. Aph. 65. Other great evacuations alſo excite convulſions; ſuch as great diſcharges from the bowels by purging. In the early periods of the hiſtory of medicine, when the limited catalogue of the materia medica debarred the phyſician from the choice of expedients, according to the circumſtances of the caſe, it would appear that this unfortunate conſequence of a violent purgative was by no means uncommon, ſince we find it often alluded to by Hippocrates. "Convulſion from Hellebore is fatal." Sect. v. Aph. 1, and again, he obſerves, in Sect. vii. Aph. 25; "Convulſions from a purge are fatal." Happily the numerous articles of mild operation, which we now poſſeſs, render ſuch an occurrence unknown to the phyſicians of modern times. Convulſions have been, likewiſe, obſerved to occur, in conſequence of exhauſtion of the animal powers, by other means; ſuch as by exceſſive fatigue; by want of food; by long continued and ſevere mental exertion; &c.

The cure of convulſions, occaſioned by inanition, from any of the cauſes juſt ſtated, will obviouſly conſiſt, in the uſe of ſuch remedies as will put a ſtop to the evacuations; in the adminiſtration of cordials and ſtimulants, to counteract the preſent failure of the vital powers; and in the frequent ſupply of moderate quantities of a cordial and nutritious aliment, to reſtore the maſs of circulating fluids, and the ſtrength of the body. Reſt, food, and relaxation, will be the remedies required in the laſt-mentioned inſtances.

But 3, *Irritation*, corporeal and mental, is the moſt fruitful ſource of convulſions. The degree of corporeal irritation, which is ſufficient to occaſion convulſions, varies greatly; not only according to the peculiarities of age, and conſtitution, but according to the part to which it is applied, and ſometimes according to circumſtances, which are not obvious. Sometimes the irritation amounts to ſevere agonizing pain; more commonly to a moderate degree of uneaſineſs; and frequently it is ſuch as to excite no perception: ſometimes it is a titillation, or attended with ſenſations on the whole pleaſurable. It may excite convulſions of the muſcles in general, when applied to the brain itſelf; or to other parts of the body, as to the bowels, ſtomach, kidneys, and other viſcera; to the gums, the ſkin, and the organs of ſenſe.

Convulſions are among the moſt common ſymptoms of irritation of the brain itſelf, either from external or internal cauſes. Thus they are frequently excited by blows, or wounds, on the head; by fractures of the cranium when a portion of the bone is depreſſed, or fragments of it are driven in upon the membranes of the brain; by effuſions of blood, lymph, ſerum, or pus, in the ventricles or on the ſurface; by bony excreſcences from the internal ſurfaces of the ſkull; or by tumours, thickening, or abſceſſes, in the membranes or ſubſtance of the brain. Mechanical injuries of the nerves, which are elongations of the brain, have alſo given riſe to general convulſions.

Irritations of parts diſtant from the ſeat of ſenſation and voluntary motion, produce the ſame effects. Thus wounds of the ſkin, and of the muſcles and tendons in the extremities, occaſion the moſt painful and fatal of all convulſive affections, the *tetanus:* and it is remarkable, that it is not a large diſcharging wound, which in general excites this diſeaſe; but a ſuperficial injury, or a wound juſt healing, when the irritation would ſeem to be leſs powerful. In this diſeaſe, all the antagoniſt muſcles of the body are ſeized at once with a convulſive action, ſo that the trunk and limbs become perfectly rigid, and the jaw is locked. Sometimes the muſcles of the back overpower their antagoniſts, the body is then bent backwards like a bow, and the patient reſts on the head and the heels; this ſtate is termed *opiſthotonos*. Sometimes, on the contrary, the action of the abdominal muſcles is moſt powerful, and the body is then bent forwards in a ſimilar manner; this condition is called *emproſthotonos*. (See theſe articles.)

Several inſtances of convulſions are related by authors, in which ſtones, of ſharp and irregular figures, were found after death in the urinary bladder, or ſticking in the pelvis of the kidney, or in the courſe of the ureters. In others, convulſions, which had occurred in conſequence of ſuch irritations, ceaſed upon the diſcharge of calculi with the urine.

Irritations in the alimentary canal are very frequently the cauſe of general convulſions, more eſpecially in young children. In children, indeed, it has been ſaid that convulſions are not to be conſidered ſo much a diſeaſe themſelves, as the indication of diſeaſe in the bowels, or other parts. (Med. Obſ. and Inq. vol. iii. p. 292.) The preſence of worms, of undigeſted aliment, of morbid ſecretions, or even a retention of the natural fæces, by conſtipation, are common cauſes of convulſions at an early age. The retention of the meconium is ſaid to occaſion the locked jaw of new-born infants, in warm climates, the *triſmus naſcentium* of authors. Some children, in fact, are ſo irritable during the few firſt years of their life, as to be thrown into convulſions by very ſlight cauſes of irritation; a diſpoſition which is only removed, as the conſtitution becomes ſtrengthened by age. The irritation of the riſing teeth, when the gums do not readily yield to their preſſure, has been frequently obſerved to excite convulſions in children, which were removed on the appearance of the teeth above the gum, or by the diviſion of the gum by means of a lancet. For it is remarkable, that the greater temporary irritation of a cutting inſtrument is borne, without any convulſion being excited, while the conſtant uneaſineſs of the irritating tooth had frequently been productive of the convulſions. In the ſame way, when convulſions are occaſioned by the irritation of worms, or of undigeſted food, in the inteſtines, the additional irritation of a cathartic medicine ſhall not increaſe the convulſive affection, which ceaſes, when its operation is completed. In the treatment of the convulſions of children, where the irritating cauſe is obvious, but cannot be inſtantly removed, the convulſive motions may be frequently ſuſpended in the mean time, by immerſion in the warm bath, by warm fomentations, or by the uſe of a ſmall doſe of an opiate, proportioned to the age and ſtrength of the child, and the violence of the diſeaſe. But ſuch meaſures are only palliative; the radical cure will depend upon the removal of the cauſe of irritation.

In conſtitutions of peculiar irritability, certain irritations of the organs of ſenſe have given riſe to convulſions. Thus in regard to the ſenſe of touch, a caſe is related by Van Swieten in which titillation of the ſoles of the feet of a young girl, excited convulſions: he alſo mentions inſtances of the ſame effects being produced by a ſudden expoſure to great light, or great noiſe; a boy was thrown into convulſions by the unexpected ſound of trumpets. Certain powerful odours have occaſioned convulſive motions when applied to the organ of ſmelling. It ſeems to have been a cuſtom formerly, ſays the author juſt mentioned, for thoſe who purchaſed ſlaves, to try them with the ſmell of the jet-ſtone, in order to diſcover whether they were ſubject to the epilepſy. Aretæus has remarked that by this odour the epileptic paroxyſm was excited; and Apulius, who was accuſed of magic, in pleading his own cauſe, made the following obſervation. "But if I wanted to throw down an epileptic perſon in a fit, what need could there be for a charm to do it? ſeeing the jet-ſtone, when it is burnt, as I read in phyſical authors, diſcovers this diſeaſe effectually; and by the ſmell of it they commonly try the health of the ſlaves in the markets." Van Swieten. Com. § 1075.

Many poiſons, eſpecially the vegetable poiſons, by their action on the nervous ſyſtem, when taken into the ſtomach, produce the moſt terrible convulſions. The cicuta aquatica, or water-hemlock, is ſaid by Wepfer to have been eaten by ſeveral children, who miſtook the roots for parſnips; they were all ſeized with ſevere convulſions, which proved fatal to two of them; the reſt having been made to vomit, and eject the poiſon from the ſtomach, ſpeedily recovered. Thus vegetable narcotics, even opium itſelf in an over-doſe, have produced ſimilar effects.

Mental irritations, or violent emotions of the mind, frequently give riſe to general convulſions, eſpecially in females, and thoſe of hyſterical habits. The influence of the mind on the body is too obvious to require much illuſtration. The actions of the heart, the circulation of the blood, and the functions of the viſcera, are variouſly modified by emotions of the mind, and no organ is more fully affected by them in its functions than the brain itſelf. Different emotions ſeem to affect the ſyſtem in different and even oppoſite ways; ſome rouſing it to actions of unuſual vigour, quickening the circulation, and ſtrengthening the powers of volition; others, again, paralyſing its ſtrength, and giving languor to all its motions. Hence the paſſions have been divided into two claſſes, exciting, and depreſſing paſſions. Now theſe oppoſite paſſions, which ſeem to produce the ſame effects as *repletion* on the one hand, and *inanition* on the other, alike excite convulſions of the body. This may be exemplified in the leading paſſions, anger, and fear, both of which are occaſionally the cauſes of convulſions. In a man under the influence of the *excitement* of anger, the heart beats with greater force and celerity; the pulſe is fuller, ſtronger, and ſwifter; every part ſwells and grows broader; a greater heat overſpreads the whole body; almoſt every muſcle is extended; the eyes are prominent from their ſockets, and look fierce and ſparkling, being charged with blood. Theſe ſymptoms imply a correſponding fulneſs and force in the veſſels of the brain, which, when carried to a certain extent, induce convulſions. On the contrary, a man under the *depreſſion* of fear, grows pale and cold, and ſhrinks in every part of the body; his pulſe is quick, but ſmall and unequal; the heart palpitates; the lungs are oppreſſed, and ſobs and ſighings follow; his ſtrength fails him; his whole body trembles, and he is ſcarcely able to articulate. Theſe phenomena ſhew a depreſſion, a collapſe of the powers of life, reſembling that which occurs from inanition, and, like that, producing ſometimes a general convulſion. See Swieten Com. in § 104. Many examples might be quoted of the convulſive attacks occaſioned by theſe paſſions, and eſpecially by fear. We ſhall mention one inſtance from the latter cauſe, for the ſake of illuſtrating the effects of another principle, the aſſociation of ideas, in re-exciting convulſions, thus originally produced. A boy was ſo much frightened by a large dog jumping upon him, that he preſently fell down attacked with epileptic convulſions: afterwards, the paroxyſm was brought on by the ſight of any large dog, or even by hearing him bark. This effect of aſſociation is frequently obſerved in a minor degree; thus, any ſubſtance uſed as a vehicle for an emetic medicine, will, in ſome perſons, when taken alone, excite ſickneſs for ſome time afterwards. Van Swieten affirms that he has ſeen a perſon, who, after having frequently taken a nauſeous purging draught, upon ſeeing the cup out of which he took it, not only ſhuddered, and became ſqueamiſh, but likewiſe had ſeveral ſtools; thus the ſole idea of a nauſeous remedy being renewed, ſupplied the place of a purge, and diſturbed the whole body. Comment. in § 1075.

There is another prolific ſource of convulſive affections, which muſt not be overlooked in deſcribing the mental cauſes of theſe formidable diſorders; namely, the principle of *imitation*. This principle ſometimes operates alone; ſometimes its operation is combined with an impreſſion of fear: and ſometimes with various other ſtrong impreſſions made on the imagination. This involuntary imitation is the ſource of almoſt all that is learnt in infancy; and its importance in the formation of character, has been well illuſtrated by Dr. Aikin. See Athenæum, No. xiii. Jan. 1808. In after-life we all experience its operation, in the irreſiſtible propenſities to yawn, to laugh, to weep, with others. Hence much of the effect of theatrical repreſentations, eſpecially crowded audiences: hence alſo the facility with which a *panic* ſpreads among an army of ſoldiers; and hence the power, on the one hand, and the cowardice, on the other, of a *mob*. This tendency to receive impreſſions and emotions involuntarily from others, and more eſpecially, when they are accompanied with corporeal motions, and the tendency to repeat thoſe motions involuntarily ourſelves, are principles rooted in the human conſtitution; and upon them much of the hiſtory of inſurrections, and alſo of the propagation of religious enthuſiaſm, depends, as well as the minor circumſtances of convulſive diſeaſes.

Every phyſician has witneſſed the effect of the ſight of an hyſterical convulſion, on other women prediſpoſed to that diſeaſe. It is not uncommon to find ſeveral women thus convulſed, one after the other, from this cauſe. We have even known the ſcream of one woman, ſeized with an hyſterical paroxyſm, excite convulſions in another, who heard it in a different room. The well-known caſes which occurred in the orphan-hoſpital at Haerlem, under the care of Dr. Boerhaave, ſhew the extenſive operation of this principle, and alſo that theſe imitative attacks may be effectually prevented, by exciting a ſtrong counter-impreſſion in the mind. That celebrated phyſician, finding that epileptic convulſions, which had occurred in one boy, attacked, one after another, all the boys who witneſſed the paroxyſms, by threats of inflicting ſevere bodily pain on the firſt who ſhould be attacked with theſe fits, ſucceeded in preventing the recurrence of the epilepſy.

This principle is ſtill farther exemplified in the epidemical convulſions which have occurred at different times in different countries. In ſeveral diſtricts of Scotland ſuch epidemics have frequently appeared. The Rev. W. Archibald, parochial clergyman of Unſt, the moſt northerly of the Shetlands, gives the following account of epidemic convulſions which occurred in his pariſh. “There is a ſhocking diſtemper, which has of late years prevailed pretty much, eſpecially among young women, and was hardly known thirty or forty years ago. About that period only one perſon was ſubject to it. The inhabitants give it the name of convulſion fits; and indeed, in appearance, it ſomething reſembles an epilepſy. In its firſt riſe, it began with a palpitation of the heart, of which they complained for a conſiderable time; it at length produced ſwooning fits, in which people ſeized with it would lie motionleſs upwards of an hour. At length, as the diſtemper gathered ſtrength, when any violent paſſion ſeized, or on a ſudden ſurpriſe, they would all at once fall down, toſs their arms about, writhe their bodies into many odd ſhapes, crying out all the while moſt diſmally, throwing their heads about from ſide to ſide, with their eyes fixed and ſtaring. At firſt this diſtemper obtained in a private way with one female, but being ſeized in a public way at church, the diſeaſe was communicated to others, but whether by the influence of fear or ſympathy is not eaſy to determine. However this was, our public aſſemblies, eſpecially at church, became greatly diſturbed with their outcries. This diſtemper always prevails moſt violently during the ſummer-time, in which ſeaſon, for many years, we are hardly one ſabbath free.” The Rev. Mr. Morriſon, giving an account of a ſimilar epidemic in his pariſh of Delting, ſays, “It moſt commonly attacks them when the church is crowded, and often interrupts the ſervice in this and many other churches in the country. On a ſacramental occaſion, fifty or ſixty are ſometimes carried out of the church, and laid in the church-yard, where they ſtruggle and roar with all their ſtrength for five or ten minutes, and then riſe up without recollecting a ſingle circumſtance that happened to them.” Statiſtical Acc. of Scotland, vol. i. p. 385. See Edin. Med. and Surg. Journ. N° xii. In another pariſh, Northmaven, a cure is ſaid to have been effected, as in the hoſpital at Haerlem, by a ſtrong counter-impreſſion upon the mind. “The cure is attributed to a rough fellow of a kirk-officer, who toſſed a woman in that ſtate, with whom he had been frequently troubled, into a ditch of water. She was never known to have the diſeaſe afterwards, and others dreaded the like treatment.” Stat. Acc. vol. xii. p. 363.

A ſimilar prevalence of convulſive affections, which occurred on the eſtates of the earl of Uxbridge and Holland Griffith, eſq. in the iſle of Angleſea, was checked by the judicious precautions recommended by Dr. Haygarth, from a knowledge of the principle which we are illuſtrating. He adviſed that all girls and young women ſhould be prevented from any communication with perſons affected with thoſe convulſions, and that thoſe who were ill ſhould be kept ſeparated as much as poſſible. See Treat. on the Imagination as a Cauſe and as a Cure of the Diſorders of the Body. Bath, 1800.

This principle of imitation, eſpecially when the imagination is ſtrongly excited by images of terror or ſuperſtition, has been reſorted to by deſigning men for the purpoſes of impoſing on the public credulity, with a view to their own profit. Upon this was founded the ſucceſs of Meſmer, De Mainauduc, and other empirics, in the diſgraceful practices of animal magnetiſm, as it was called; the nature and impoſition of which were fully detected and expoſed by the commiſſions appointed by the French king for the purpoſe of the inveſtigation. The celebrated Dr. Franklin was one of theſe commiſſioners, and his report has fully developed the myſtery of the magnetizers. By the aid of circumſtances, of ſituation, gloom, &c. and by their own enthuſiaſm, they gradually worked on the minds of their company, who were already pre-diſpoſed to receive any impreſſion, for they did not operate on ſingle individuals, until they brought them, mind and body, to a ſtate of extreme irritability; then, aſſuming extravagant geſtures and violent motions, the ſpectators were led to an involuntary imitation, and as ſoon as one of the party ſhewed any ſymptoms of violent or convulſive exertion, the reſt were ſpeedily affected in the ſame way. This was called the criſis, and the operation was conſidered as complete. Dr. Franklin ſhewed, that, without the aid of local circumſtances, of numbers, &c. the powers of the magnetizer amounted to nothing.

It were unneceſſary to purſue this illuſtration farther, or it might be ſhewn that the propagation of religious enthuſiaſm and fanaticiſm is effected by the ſame means; is frequently connected with convulſive motions, or frantic geſtures, amounting nearly to convulſions; whence we find jumpers, whirlers, and originally quakers, as the diſtinguiſhing appellations of ſects; and that it depends much upon the contagion of the principle of imitation among crowded aſſemblies, for its ſucceſs.

But to return to the ſubject of convulſions, more ſtrictly within the ſphere of pathology. We have mentioned the indications and means of cure, in moſt caſes, as they occurred. In convulſions, which come under the two firſt heads, as ariſing from repletion and inanition, it muſt be obvious, that an evacuating ſyſtem muſt be adopted in the firſt, and the contrary, or a ſyſtem of ſupport and nutrition, in the ſecond. The individual expedients to be adopted, on either of theſe occaſions, will readily ſuggeſt themſelves, according to the peculiar circumſtances of the caſe. In convulſions, which ariſe from irritation, the diſcovery and removal of the irritating cauſe, where it is of a nature to be removed, is not leſs obviouſly requiſite for the cure. But in the mean time, before any of theſe intentions can be fulfilled, the violence of the convulſive motions may continue, ſo as to injure the body, or deſtroy life. It is deſirable, therefore, that ſome palliative meaſures ſhould be adopted; and theſe are chiefly the uſe of medicines of the antiſpaſmodic claſs, ſuch as opium, muſk, æther, and other powerful ſtimulants; the uſe of the warm bath; or of the oppoſite expedient, the cold bath. Of theſe remedies, with the exception of the laſt, little is required to be ſaid; the efficacy of the former being well underſtood. But as the cold bath is a powerful expedient, and can be often reſorted to more ſpeedily than the others, it may be neceſſary to mention the nature of its powers. Dr. Currie, from an experience of eight years, aſſerts that the cold bath is very efficacious in removing the convulſions of children, whether the diſorder originates in worms or other cauſes; that it ſeldom fails in ſtopping the paroxyſms, at leaſt for ſome time, thereby giving an opportunity of employing the means fitted to remove the particular irritation. Several caſes of tetanus have alſo been cured by the cold bath of late years. In the convulſions of hyſteria, the cold bath, or indeed a plentiful affuſion of cold water, is an almoſt infallible remedy. Dr. Currie obſerves, that the efficacy of the cold bath in convulſive diſorders is the greateſt, when it is employed during the preſence of the convulſion; and alſo that it is of greater efficacy in general convulſive affections, than in thoſe which are only partial. In chorea ſancti Viti, for inſtance, it has been frequently tried without any ſucceſs. See Currie, Reports on Water, &c. Append. p. 13. *et ſeq.*

Where the ſource of irritation is not diſcoverable, beſides theſe palliative means, other medicines are commonly employed to give ſtrength and vigour, and to leſſen the irritability of the moving fibre, ſo as to render it leſs ſuſceptible of being excited to extraordinary action. The various articles of tonic and corroborant medicine have been adminiſtered with this view, but moſt frequently, the metallic ſalts and oxydes; as the ſulphates of zinc, and iron, and copper; the oxyde of zinc; and even the cauſtic nitrate of ſilver has been employed in ſmall doſes.

CONVULSIVE DISEASES, thoſe diſeaſes in which convulſions are the leading ſymptoms. See CONVULSIONS. Theſe diſeaſes have received different appellations, and alſo require different methods of treatment, according to the varieties of their form. Some conſiſt of general convulſions of the whole muſcular ſyſtem, as *tetanus*, *epilepſy*, ſome forms of *hyſteria*, &c.; others are diſtinguiſhed by the convulſions being confined to particular parts; as *triſmus*, when the muſcles of the jaw are affected with ſpaſm; *chorea*, or St. Vitus' dance. Hiccough, and even cough, may be conſidered as partial convulſions. See theſe articles reſpectively.

CONVULSIVE *Aſthma*. See ASTHMA.

CONWAY, in *Geography*, a river in North Wales, called by Ptolemy and Antoninus *Conovius*. *Kynwy*, in the ancient Britiſh language, ſignifies the *great river*, from which are derived the words *Conwy* and *Conway*. This ſtream, conſidered one of the fineſt in Europe, riſes in the mountains of Penmachno, out of Llyn Conwy, and is navigable for ſmall veſſels to Llanrwſt bridge; erected by Inigo Jones with a centre arch 60 feet wide (ſee CANAL); but receiving many tributary ſtreams in the courſe of 12 miles, it becomes ſufficiently deep to bear ſhips of conſiderable bulk, and is nearly a mile in breadth at high water, but not more than 150 feet at low water, and eight feet deep, at the ferry oppoſite the town of Conway, beyond which it flows into the Iriſh Sea. The ſpring-tides vary from 14 to 18 feet; conſequently veſſels of 400 tons burthen may approach cloſe to the town: nevertheleſs the ſhifting ſand-banks make the entrance of the port dangerous. The *mya margaritifera* of Linnæus, or pearl muſcle, made the river of importance previous to the Roman invaſion. Such was its celebrity, that Suetonius acknowledged the pearl-fiſhery of the Conway to have been one of his inducements for undertaking the ſubjugation of Wales. According to Pliny, the muſcles, called by the natives *kregindiliw*, were ſought for with avidity by the Romans, and the pearls found within them highly valued; in proof of which it is aſſerted, that Julius Cæſar dedicated a breaſt-plate, ſet with Britiſh pearls, to Venus Genetrix, and placed it in her temple at Rome. A fine ſpecimen from the Conway is ſaid to have been preſented to Catharine, conſort of Charles II., by ſir Richard Wynne of Guedir; and it is further ſaid, that it has ſince contributed to adorn the regal crown of England. Lady Newborough poſſeſſes a good collection of the Conway pearls, which ſhe purchaſed of thoſe who were fortunate enough to find them, as there is no regular fiſhery at preſent. The late ſir Robert Vaughan had obtained a ſufficient number to appear at court, with a button and loop to his hat, formed of theſe beautiful productions, about 28 years paſt.

CONWAY, or ABERCONWAY, an ancient town of Carnarvonſhire, North Wales, is ſeated on the river Conway, near its confluence with the Iriſh Sea. This place does not appear to have acquired any conſequence till the time of Hugh Lupus, earl of Cheſter, who fortified the mouth of the river about the year 1098; and it obtained more diſtinguiſhed importance during the reign of Edward I., who enlarged the fortifications, and erected a very ſtrong caſtle in 1284. The outline of this venerable and romantic place is triangular, and is ſtill ſurrounded with embattled walls. Theſe are erected in many places upon ſolid rocks, and are one mile and an half in circumference; they had four gates, and were defended by 24 baſtions; in addition to which, two curtains projected into the river, where they terminated with watch-towers: but theſe and one of the former have fallen. Edward I. evinced great ſkill in conſtructing the defenſive works of Conway, and particularly by erecting his ſuperb caſtle on the baſe of the triangle next the river, where nature had placed a vaſt perpendicular rock of ſlate. He thus protected England from the incurſions of the Welſh, who were commanded by Llewelyn; and afforded himſelf and ſucceſſors an impregnable poſt for collecting the means of invaſion, when an opportunity offered for entering Wales with any proſpect of ſucceſs. By this caſtle he had it in his power to occupy the neighbouring paſs of Penmaen-Mawr at pleaſure, and by that means to cut off all communication with the interior of the principality: and yet this fortreſs had once nearly coſt him his crown, in proceeding to it at the head of his army. On this occaſion, Edward incautiouſly croſſed the river Conway with a few attendants, and was ſeparated from the town by the flowing of the tide. At this critical moment the Welſh attacked the caſtle; but although the monarch and his little band of ſoldiers were deſtitute of every refreſhment, except honey and water, they had the bravery and addreſs to reſiſt their opponents, till the ebbing of the tide. Richard II. took refuge in this caſtle, on his return from Ireland in 1399, and was delivered into the power of his enemies from it, through the treachery of the duke of Northumberland. During the civil war, Charles I. particularly requeſted Williams, archbiſhop of York, to put the caſtle in a complete ſtate of defence, for his uſe; and pledged his honour that the cuſtody of it ſhould remain with the prelate, or any perſon he thought proper to appoint, till the ſum expended was repaid. When the repairs were accompliſhed, Williams placed the caſtle under the government of his nephew, William Hooker. The neighbouring gentry, conceiving it a ſecure depoſitory, ſent their moſt valuable writings and plate to the keeping of the archbiſhop and Hooker; the former giving his receipts, and making himſelf reſponſible in caſe of loſs. About a year afterwards, colonel ſir John Owen obtained the appointment of governor of Conway caſtle from prince Rupert, and, proceeding ſuddenly to the place, ejected the prelate and his adherents, who were poſitively denied permiſſion to remove the articles, for which receipts had been given. Greatly irritated at this unworthy conduct, Williams vainly applied to the court for redreſs. Yielding at length to the repreſentations of general Mytton, who commanded the parliament's army, he adopted their cauſe, and fortified his own houſe, which was garriſoned by Mytton's troops. A conflict ſoon afterwards occurred, in which the prelate was wounded in the neck. After the ravage of the civil wars, a grant was made of it to Edward, earl of Conway, who, in 1665, dilapidated the buildings. At preſent it is held by a private proprietor under the crown. A little hill is planted and laid out towards the mouth of the river, commanding a fine view of the town and caſtle on one ſide, and the ſea on the other, to which is given the claſſical name of Arcadia. The ruins are ſtill uncommonly magnificent, and bounded by the river, a creek, and the town. The walls are not greatly injured; and eight vaſt towers, ſurmounted by turrets, are yet ſtanding. In one of theſe is an oriel window, richly ornamented, where the toilet of queen Eleanor is ſaid to have ſtood, at the period when her lord made the caſtle the ſcene of his hoſpitality: another of the towers, undermined by the inhabitants of Conway, ſplit aſunder, and a vaſt fragment fell upon the beach, where it lies, a wonderful ſpecimen of ancient maſonry. The hall, erected over extenſive vaults, is lighted by ſix windows towards the country, and three on the oppoſite ſide. Six of the eight pointed arches of the roof are yet entire. The length of the hall is 139 feet, and the breadth 32. The caſtle is now held from the crown by O. Holland, eſq., who pays a rent of 6*s.* 8*d.*, and is bound to furniſh lord Hertford with a diſh of fiſh, whenever he paſſes through Conway. However commanding and beautiful the town appears without the walls, the contraſt within is melancholy in the extreme, where ruins and deſolation prevail in every direction. Edward I., when he paſſed a Chriſtmas here with his queen Eleanor and the whole court, erected the place into a free borough, and the mayor was conſtituted conſtable of the caſtle. The preſent government is compoſed of an alderman, recorder, coroner, water-bailiff, &c. Mr. Evans mentions, in his "Tour through North Wales," an old houſe ſituated in Caſtle-ſtreet, called the college, with a curious window, and ſeveral coats of arms of the Stanleys; and another of large dimenſions, named *Plas Mawr*, built in 1585, by Robert Wynne, eſq. of Guedir, which he ſuppoſes, from the inſcriptions on the front, to have been erected for charitable purpoſes, particularly as there are many rude badges within, (probably of contributors); and the ſupporters of the arms of Dudley, earl of Leiceſter, decorate the walls and ceiling. The only religious ſtructure in Conway was an abbey of Ciſtertian monks, founded by prince Llewelyn ap Jorwerth, in 1185, who was buried in the abbey church, where his body remained till the diſſolution of the monaſtery, when it was carried to Llanrwſt. Edward I, conceiving the monks improper inmates of his fortreſs, removed them to a new abbey, which he erected near Llanrwſt, but did not deprive them of their privileges and endowments. Their old church was then made parochial, and the preſentation granted to the abbot and convent, on condition they provided three chaplains, two of whom were to be Engliſhmen, and the third a Welſhman; one of the former received the title and office of vicar, and, after having been named by the convent, was to be preſented by the dioceſan. The church of the original foundation is ſituated in the centre of the town; but it is more remarkable for its remote antiquity, than any beauty in the form or decorations. Cynan ap Owen Gwynedd was buried in this church, 1220; and there are at preſent ſeveral modern monuments of the Wynne family: one of the inſcriptions within it records the interment of Nicholas Hooker of Conway, gentleman, in 1637, who is ſaid to have been the 41ſt child of his father, by his wife Alice, and the father himſelf of 27 children. The tithes of the church are veſted in three truſtees, for the benefit of the poor of the town, and three villages in the neighbourhood: indeed the want of trade and manufactories renders the lower claſſes truly wretched, many of whom obtain a miſerable ſubſiſtence by collecting and burning into *barilla*, on the beach, different ſpecies of *fuci* or ſea-wreck, which is ſold for trifling ſums to the purchaſers, who make a great profit on their labour. The inconſiderable trade now carried on conſiſts of copper, lead, calamine, and potatoes for exportation; but little or nothing is imported. As Conway has hitherto been the great thoroughfare to Ireland, the inhabitants derived much advantage from the paſſengers; but the new road through the Ogwyn mountains will ſoon rob them even of this ſupport. Hills of lime-ſtone abound near this town, and ſome lead and copper mines, having chert, or a ſpecies of black hornſtone for a matrix. In a black ſilicious mountain here maſſes of porous chert are found, which, on trial, are found as fit for making our mill-ſtones as thoſe imported from France. Mr. Richard Bowes, who made this diſcovery, and ſent ſpecimens of the ſtones to the Society of Arts, was rewarded by that patriotic body. See their Tranſactions, vol. xviii. p. 197. Situated 240 miles N.W. of London. Population in 1801 was 889; the number of houſes 182. Bingley's and Evans's Tour in North Wales.

Conway, a townſhip of America, in the province of New Brunſwick, Sudbury county, on the weſtern bank of St. John's river. It has the bay of Fundy on the ſouth; and at the weſternmoſt point of the townſhip there is a tolerably good harbour, called Muſquaſh Cove.—Alſo, a townſhip in the N.E. corner of Strafford county, New Hampſhire, on a bend in Saco river, incorporated in 1765, and containing 574 inhabitants. It was called "Pig-wacket," by the Indians.—Alſo, a thriving townſhip in Hampſhire county, Maſſachuſetts, incorporated in 1767, and containing

ing 2092 inhabitants. It lies 13 miles N.W. of Northampton, and 115 N.W. by W. of Boſton.

Conway, *Cape*, a point of land on the eaſt coaſt of New Holland, ſo called by captain Cook in 1770, and lying in S. lat. 26° 36′. W. long. 211° 28′; between which and cape Hilſborough is a bay, which the ſame navigator called *Repulſe bay*. Within this cape there lie two or three ſmall iſlands, which would ſerve to ſhelter that ſide of the bay from the ſoutherly and ſouth-eaſterly winds, that ſeem to prevail here as trade-winds. Among the many iſlands that lie upon this coaſt, called by Cook *Cumberland iſlands*, one is more remarkable than the reſt: it is of ſmall circuit, very high, and peaked, and lies E. by S., 10 miles from cape Conway, at the ſouth end of the paſſage. This paſſage is from three to ſeven miles wide, and eight or nine leagues in length, N. by W. $\frac{1}{2}$ W., S. by E. $\frac{1}{2}$ E. It is formed by the main on the weſt, and by the iſlands on the eaſt, one of which is at leaſt five leagues in length. The depth of water, in running through it, was from 20 to 25 fathoms, with good anchorage every where; and the whole paſſage may be conſidered as one ſafe harbour, excluſive of the ſmall bays and coves which abound on each ſide, where ſhips might lie as in a baſon. The land both upon the main and iſlands is high, and diverſified by hill and valley, wood and lawn, with a green and pleaſant appearance. This paſſage, being diſcovered on Whitſunday, was called *Whitſunday paſſage*.

CONYA, a river of South America, in Surinam, or Dutch Guiana.

CONYBEARE, John, in *Biography*, a celebrated Engliſh prelate, born in the neighbourhood of Exeter, and educated at the free-ſchool in that city, from whence he was admitted at Exeter college, Oxford, where he applied himſelf ſo diligently to his ſtudies, that, in 1710, when he was but 19 years of age, he was choſen probationary-fellow upon ſir William Petre's foundation. He obtained the ſeveral degrees with reputation, and was ordained prieſt in 1716. During the next year he officiated as curate at Fetcham in Surrey. Upon his return to Oxford, he became tutor to his own college, and gained much celebrity as a preacher. He was afterwards appointed by Dr. Gibſon, biſhop of London, to the ſituation of one of his majeſty's preachers at Whitehall. In the year 1724, lord chancellor Macclesfield preſented him with the rectory of St. Clements, Oxford; and in 1728, he took the degree of bachelor, and in the following year, that of doctor in divinity. In 1730, he was elected to the high and arduous office of maſter of Exeter college; and in a ſhort time he undertook, at the deſire of the biſhop of London, and publiſhed a very excellent anſwer to Tindal's "Chriſtianity as old as the Creation," under the title of "A Defence of revealed Religion againſt the Exceptions of a late Writer, &c." This was publiſhed in 1732; and before the end of that year he was raiſed to the office of dean of Chriſt-church. He now reſigned the headſhip of his college, and ſpeedily the rectory of St. Clements; and in 1734, he had the honour of entertaining, at his own apartments, the prince and princeſs of Orange, and of receiving the thanks of queen Caroline for his conduct on that occaſion. From this period, to the year 1750, Dr. Conybeare received no additional preferment: he was then appointed to the biſhopric of Briſtol, which, though it increaſed his dignity in church preferment, was no addition to his fortune. This high honour was followed by a long train of illneſs, which terminated his valuable life in the year 1755. The good prelate left behind him a truly eſtimable character: he fulfilled all the duties of life with honour to himſelf, and for the advantage of thoſe connected with or dependent upon him. Zealouſly attached to the church, of which he was a diſtinguiſhed member, he was, at the ſame time, candid and liberal towards proteſtant diſſenters, with ſome of whom he had been educated, and with others he maintained an occaſional but friendly correſpondence through life. Two years after his deceaſe, were publiſhed, for the benefit of his ſurviving relations, ſermons in two volumes, 8vo. The very numerous liſt of ſubſcribers who patronized this undertaking, ſhew in what high public eſtimation Dr. Conybeare was held by his contemporaries. Biog. Brit.

CONYZA, in *Botany*, (derivation uncertain.) Linn. Gen. 950. Schreb. 1286. Willd. 1480. Gært. 971. Juſſ. 180. Vent. 2. 511. Coniſe; Encyc.

Gen. Ch. *Common calyx* either imbricated, or in ſeveral nearly equal ranks. *Cor.* Florets of the diſk hermaphrodite, numerous, tubular, funnel-ſhaped; border five-cleft, patulous; florets of the circumference female, either apetalous or funnel-ſhaped, not compoſing a ray; border generally three-cleft. *Stam.* Filaments five, very ſhort, capillary; anthers united into a hollow cylinder. *Piſt.* in the *diſk*. Germ oblong; ſtyle filiform, length of the ſtamens; ſtigma two-cleft: in the circumference ſtyles and ſtigma more ſlender. *Seeds* oblong; down ſimple. *Recep.* naked, flat.

Eſſ. Ch. Seeds of the calyx imbricated, or in ſeveral nearly equal ranks. Florets of the circumference female, apetalous, or funnel-ſhaped, with a three-cleft border, not compoſing a ray. Down ſimple. Receptacle naked.

* *Leaves not decurrent.*

* *Herbaceous.*

1. C. *ſquarroſa*. Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. Lam. Ill. Pl. 697. fig. 1. Gært. tab. 166. Eng. Bot. 1195. Flor. Dan. tab. 622. (C. major vulgaris; Bauh. Pin. 265. Tourn. 454. C. Matthioli, baccaris Monſpelenſium; Cluſ. Hiſt. 2. 21. Lob. ic. 574. Blackw. tab. 102.) Great fleabane, or Plowman's ſpikenard. "Leaves ovate-lanceolate, downy; ſtem corymbous; calyx-ſcales foliaceous, recurved, and prominent." *Root* biennial, branched, and fleſhy. Whole herb ſoft and downy, in flavour bitter, and ſomewhat aromatic. *Stem* two or three feet high, erect, angular, leafy, but little branched, many-flowered. *Leaves* alternate, ſomewhat crenate, upper ones often entire. *Flowers* yellowiſh; calyx egg-ſhaped; outer ſcales green, recurved; inner ones reddiſh, erect, ciliated. *Seeds* angular; down ſcabrous. *Receptacle* tubercled. A native of England, and other parts of Europe, on a dry calcareous ſoil. 2. C. *linifolia*. Linn. Sp. Pl. 2. Mart. 2. (Aſter dracunculoides; Lam. Aſter ſolidaginoides; Willd. Aſter americanus albus, mezerei arabum exaſperatis foliis; Pluk. alm. 56. tab. 79. fig. 2.) "Leaves linear-lanceolate, quite entire; corollas rayed." *Stems* a foot or a foot and half high, erect, hardiſh, green. *Leaves* reſembling thoſe of mezereon or hyſſop, only more obtuſe, ſmooth, and ſtiff. *Flowers* on ſhort terminal peduncles; florets white, ſlender, reflexed. Its radiate flower certainly excludes it from this genus; but as it is not inſerted in our work under Aſter, we have retained it here. A native of North America. 3. C. *ſcabra*. Linn. Mant. 113. Mart. 7. Willd. 2. "Leaves oblong; ſomewhat toothed, ſeſſile, ſcabrous; peduncles one-flowered, elongated." *Leaves* rugged on both ſurfaces, four or five teeth on each ſide. *Peduncles* axillary, at the top of the branches, becoming finally ſix times the length of the leaves. A native of the Eaſt Indies. 4. C. *ſymphytifolia*. Mart. 35. Houſton MSS. "Leaves oblong-egg-ſhaped, ſcabrous; flowers in terminal racemes." *Root* perennial. *Stem* three feet high. *Leaves* four or five inches long, one inch and a half broad in the middle, rough,

like thoſe of comfrey. *Flowers* yellow; on branched peduncles. Sent by Dr. Houſton to Miller from La Vera Cruz. 5. C. *folioloſa.* Willd. 3. "Leaves oblong, nearly entire, half embracing the ſtem, downy; peduncles one-flowered, finally much elongated." *Stem* much branched, diffuſe, downy; branches thick ſet with leaves. *Leaves* alternate, downy on both ſurfaces. A native of the Eaſt Indies. 6. C. *patula.* Mart. 30. Willd. 4. Hort. Kew. 3. 184. "Leaves elliptical, ſerrated, villous underneath; calyxes ſomewhat globular; ſcales lanceolate, awl-ſhaped; branches ſpreading." *Root* annual. *Stem* a foot and half high, taper, ſlightly covered with a mealy down. *Leaves* about four inches long, and two broad in the middle, diminiſhing gradually in ſize on the upper part of the ſtem and branches. *Flowers* purple; peduncles at the end of the branches generally three-flowered; calyxes ſoft and ſwollen in the middle; ſcales ſmall and acute. A native of the northern parts of China, producing a ſucceſſion of flowers from July to the end of autumn. 7. C. *paniculata.* Willd. 5. "Leaves oblong, ſeſſile, downy on both ſurfaces; lower ones petioled; toothed; teeth reflexed; ſtem panicled; corymbs peduncled, axillary." *Stem* four feet high, about the thickneſs of a ſwan's quill, erect, cylindrical, hollow, ſtriated; branches alternate, erect, ſimple. *Leaves* on the ſtem petioled, on the branches ſeſſile. *Calyx-ſcales* linear-awl-ſhaped, ſpreading, reflexed. A native of the Eaſt Indies. 8. C. *bifrons.* Linn. Sp. Pl. 7. Mart. 9. Willd. 6. (Eupatoria conyzoides maxima canadenſis; Pluk. alm. 141. tab. 87. fig. 4.) "Leaves ovate-oblong, embracing the ſtem, ſerrated, wrinkled." *Root* thick, fibrous. *Stems* ſeveral, erect. *Leaves* rough. *Flowers* yellow, in round terminal bunches. A native of Canada, flowering in July. Diſtinct from Inula bifrons. 9. C. *bifoliata.* Linn. Sp. Pl. 9. Mart. 10. Willd. 7. (Eupatoria conyzoides integro jacobææ folio; Pluk. alm. 140. tab. 177. fig. 1. C. axillaris; Lam.?) "Leaves oval, toothed; peduncles two-leaved; bractes oppoſite;" Linn. "Leaves cuſpidate-toothed; lower ones petioled, roundiſh egg-ſhaped; upper ones ſeſſile, oblong, wedge-ſhaped at the baſe; racemes axillary, leafy at the baſe, peduncled;" Willd. "Leaves inverſely egg-ſhaped, unequally and finely toothed, petioled; racemes axillary, leafy at the baſe, forming a terminal panicle;" Lam. *Stem* a foot and half or two feet high, ſimple, ſlightly ſtriated, downy. *Leaves* alternate, ſoft, green, and almoſt ſmooth above, cinereous and downy underneath. *Flowers* ſmall; bractes truly alternate, though ſome ſeem oppoſite; calyxes villous, reddiſh; Lam. Deſcribed from a dried ſpecimen in the Herbarium of Commerſon. In ſmaller ſpecimens, probably the growth of a poor ſoil, the peduncles are one-flowered, with oppoſite bractes. In larger ſpecimens the racemes are from three to ſix-flowered; peduncled, furniſhed with two, either oppoſite or alternate bractes, and ſometimes with four alternate ones; bractes oblong, ſeſſile, generally entire; Willd. A native of the Eaſt Indies and the Iſle of France. 12. C. *pubigera.* Linn. Mant. 113. Mart. 11. Lam. 9. Willd. 8. Lour. Cochinchin. 495. (Sonchus volubilis; Rumph. Amb. 5. 299. tab. 103. fig. 2.) "Leaves oblong, ſomewhat toothed, nearly ſeſſile; peduncles woolly, about two-flowered." *Branches* with a few ſcattered hairs. *Leaves* alternate, wedge-ſhaped at the baſe, green on both ſurfaces, with a few ſcattered hairs, not ſcabrous; Linn. *Stem* ſomewhat ſhrubby, eight feet high, cylindrical, climbing, branched. *Leaves* broad-lanceolate, ſomewhat pubeſcent, ſcattered, petioled. All the florets immerſed in a ſimple down; Lour. A native of the Eaſt Indies and China. 11. C. *ſtricta.* Willd. 13. "Leaves linear-lanceolate, attenuated at the baſe, quite entire, hairy; flowers in corymbs; ſtem panicled, ſtiff." *Root* annual. *Stem* a foot and half high, erect; branches ſhort, erect, cloſe to the ſtem. *Leaves* alternate, numerous, an inch long, obtuſe, with a point, narrowed at the baſe. *Corymbs* ſmall, faſtigiate at the tops of the branches. *Flowers* ſmall; down reddiſh. A native of the Eaſt Indies. 14. C. *caneſcens.* Linn. jun. Sup. 367. Mart. 5. Willd. 18. Thunb. prod. 153. (C. pinifolia; Lam. 18. Elichryſum peregrinum anguſtifolium floſculis ſpadiceis in apices crinitos deſinentibus; Seb. Muſ. 1. 38.) "Leaves linear, ſtiff, folded back at the edges; downy underneath; panicle faſtigiate." Whole plant hoary. *Stem* from twelve to fifteen inches high, nearly ſimple, cylindrical, ſtiff, lateral branches ſhort. *Leaves* three inches long, a line broad. *Flowers* purple; calyx ſhort; ſcales imbricated, lanceolate, villous, only half the length of the flowers; down intermixed with the florets; giving the flowers a feathered appearance. 15. C. *oleæfolia.* Lam. 20. Willd. 15. (C. orientalis pumila incana oleæfolio; Tourn. cor. 33.) "Leaves lanceolate, attenuated at the baſe, obtuſe, downy; corymb terminal; ſtem ſimple." *Root* perennial. *Stem* ſeven or eight inches high, erect. *Leaves* not an inch long, three or four lines broad, ſcattered. *Flowers* in a cloſe faſtigiate corymb; peduncles ſcaly; calyx oblong; ſcales cloſely imbricated, egg-ſhaped, obtuſe; down reddiſh, longer than the calyx. A native of America. 16. C. *viſcoſa.* Mart. 34. Houſt. MSS. "Leaves egg-ſhaped, ſerrated, villous; flowers axillary and terminal." *Root* annual. Whole herb viſcid. *Stem* a foot high, branched. *Leaves* one at each joint, ſeſſile. *Flowers* white; peduncles ſlender; generally three-flowered. *Seeds* chaffy. A native of La Vera Cruz. 17. C. *mollis.* Willd. 19. "Leaves rhomboid-egg-ſhaped, nearly ſeſſile, toothed, pubeſcent, tomentous underneath; ſtem naked upwards; flowers in a corymb." *Branches* cylindrical, ſtriated. *Leaves* an inch long, very white underneath. *Corymb* terminal; branches alternate, few-flowered, divaricated; peduncles one-flowered; calyx-ſcales linear-lanceolate; down long, ſnow-white. 18. C. *chenopodifolia.* Lam. 12. Willd 20. "Leaves ovate-deltoid, unequally ſerrated, ſoft; racemes ſhort, terminating the ſtem and branches." *Stem* tomentous upwards. *Leaves* alternate, petioled, tomentous when young, afterwards nearly ſmooth. *Flowers* whitiſh, ſeſſile, four or five together at the top of the ſtem and branches; calyx-leaves linear, very narrow, tomentous, almoſt equal; bractes cloathed with fine ſilky decumbent hairs. A native of the Iſle of Bourbon. There is a variety with broader, roundiſh-egg-ſhaped leaves, a little cut at the baſe. 19. C. *cinerea.* Linn. Sp. Pl. 14. Mart. 16. Lam. 3. Willd. 21. (Senecio indica, foliis ternis crenatis; Burm. Zeyl. 211. tab. 96. fig. 1. S. indicus atriplicis folio; Mor. Hiſt. 106. tab. 17. fig. 7. Olus ſcrophinum; Rumph. 6. tab. 14. fig. 1.) "Leaves egg-ſhaped, ſlightly crenate; lower ones obtuſe, upper ones acute; panicles naked, terminal;" Lam. *Root* annual. *Stem* about a foot high, ſlender, pubeſcent. *Leaves* ſmall, rather diſtant, narrowed into a petiole, cinereous-green, whitiſh underneath. *Flowers* purple, ſmall; peduncles branched, almoſt capillary; calyx-ſcales acute; down white, longer than the calyx. A native of the Eaſt Indies. 20. C. *prolifera.* Lam. 7. Willd. 22. (Sonchus volubilis Javanus; Rumph. 5. 299. tab. 104. 1?) "Branches proliferous at the top; leaves egg-ſhaped, toothed-angular, narrowed into a petiole; corymbs cloſe, terminal." *Branches* finely ſtriated, full of pith, ſcabrous, producing near the top ſome ſmaller villous branches, and giving the plant a proliferous appearance. *Leaves* ſmall, acute, green, and almoſt ſmooth above, hoary, and cloathed with ſhort hairs underneath. *Corymb* almoſt ſeſſile; calyx-ſcales awl-ſhaped, down white, the length of the calyx. A native of the iſland of Java. 21. C. *heterophylla.* Lam. 8. "Some of the leaves a little heart-ſhaped;

others rounder; flowers panicled." *Stem* about a foot and half high, branched, finely ſtriated, cloathed with very ſhort hairs. *Leaves* rather ſmall, petioled, cinereous underneath. *Flowers* ſmall; calyx-ſcales acute, purpliſh at the tip; down white, a little longer than the calyx. A native of the Eaſt Indies. 22. C. *lacera.* Lam. 5. Burm. Ind. 180. tab. 59. fig. 1. "Leaves ſomewhat lyrate, appearing torn, downy; flowers nodding." *Stem* about a foot and half high, ſimple, cylindrical, cottony. *Leaves* alternate, obtuſe; lower ones petioled. *Flowers* in a ſmall terminal panicle or raceme; peduncles axillary, very ſhort, often in pairs; calyxes villous; ſcales imbricated, very narrow, awl-ſhaped; down whitiſh, not longer than the calyx. A native of Java. 23. C. *hirſuta.* Linn. Sp. Pl. 19. Mart. 19. Willd. 24. Burm. Ind. 180. Lour. Cochinchin. 495. "Leaves oval, quite entire, ſcabrous, hirſute underneath." *Stem* a foot high, upright, ſimple, cylindrical, hairy. *Leaves* ſcattered, ſomewhat acute, ſometimes edged with very minute teeth. *Flowers* yellow, crowded, terminal; calyx ſhort, hairy. A native of Java, China, and Cochinchina. 24. C. *pauciflora.* Willd. 25. "Leaves lanceolate-obovate, attenuated above and below, ſmooth, ſcabrous underneath, ſerrated; branches one-flowered." *Root* annual. *Stem* from half a foot to a foot and half high, erect, ſtriated, a little branched towards the top. *Leaves* an inch and half long, green. *Flowers* large, ſolitary, terminating the branches; calyx-ſcales awl-ſhaped; down ſcabrous. A native of Africa, about the river Senegal. 25. C. *ægyptiaca.* Mart. 27. Willd. 26. Hort. Kew. 3. 183. (Erigeron ægyptiacum; Linn. Mant. 112. E. ſerratum. Forſk. ægyp. 148. C. capitata ſive globoſa; Bocc. Sic. 13. tab. 7. fig. B. Moriſ. hiſt. 3. 114. tab. 20. fig. 14. Jacobæa ægyp. fol. glauco coronopi; Boerh. lugdb. 99.) "Leaves oblong-ſpatulate, toothed, hairy; flowers in ſomewhat globular panicles; calyx-ſcales awl-ſhaped, ſoft." *Root* annual. *Stem* a foot and half high, erect, ſomewhat ſtriated, green, pubeſcent, a little viſcid. *Leaves* alternate, ſeſſile, ſcarcely half embracing the ſtem, rather obtuſe. *Flowers* yellow, terminal, four or five together, on purpliſh peduncles; calyx roundiſh; ſcales awl-ſhaped; florets minute; thoſe of the circumference numerous; piſtils yellow, quickly vaniſhing, ſurrounding the diſk with a broad downy ring. A native of Sicily and Egypt. 26. C. *Gouani.* Linn. Mant. 469. Willd. 27. (Erigeron Gouani; Jacq. Hort. 3. 43. tab. 79.) "Leaves lanceolate, ſerrated near the top, ſcabrous at the edges; lower ones inverſely egg-ſhaped; flowers cluſtered; calyx-ſcales lanceolate, membranous at the margin." *Stem* a foot high, ſimple, with a few erect hairs. *Leaves* alternate, half embracing the ſtem, even-ſurfaced. *Flowers* panicled; calyx roundiſh, imbricated; ſcales ſmooth, convex, cloſe; florets of the circumference apetalous, more numerous than thoſe of the diſk; ſtigma bifid, oblong. A native of the Canary Iſlands. 27. C. *ſenegalenſis.* Willd. 28. "Leaves oblong, inverſely egg-ſhaped, toothed; teeth near the baſe; deeper flowers in ſomewhat of a cloſe corymb." *Stem* ſtriated, hairy, hiſpid. *Leaves* ſeſſile, ſcabrous on both ſurfaces with callous points; lower ones an inch long. *Flowers* at the top of the ſtem; calyx-ſcales linear-lanceolate, ſcabrous. A native of Africa, about the river Senegal. 28. C. *dentata.* Willd. 29. "Leaves lanceolate, embracing the ſtem, dilated at the baſe, pubeſcent, toothed; branchlets one-flowered; peduncles elongated; ſtem hairy." *Stem* cylindrical, branched. *Leaves* an inch long. *Flowers* on long peduncles; calyx-ſcales linear-awl-ſhaped, ſcabrous; lower ones ciliated. A native of Africa about the river Senegal. 29. C. *villoſa.* Willd. 30. "Leaves lanceolate, embracing the ſtem, dilated at the baſe, villous, ſerrated; branchlets one-flowered; ſtem villous." But little different from the preceding. 30. C. *aurita.* Linn. jun. Sup. 367. Mart 24. Lam. 17. Willd. 31. "Leaves toothed; root-ones ſmoothiſh, inverſely egg-ſhaped; ſtem ones oblong, pubeſcent, ſomewhat pinnatifid at the baſe; ſtem panicled; calyx-ſcales awl-ſhaped; outer ones hairy." *Root* annual. *Stem* a foot high, erect, red, hairy; branches erect, ſimple. *Root-leaves* marked with red veins, widely ſerrated, and crenated between the ſerratures; ſtem-leaves ſomewhat lanceolate, ſoft; ſerrated near the top; ſinuated in the middle; ſomewhat pinnated at the bottom; ſerrate-toothed along the whole margin; pinnæ two or three on each ſide, ſpreading. *Flowers* white, ſmall; thoſe of the circumference linear; piſtils longer, erect. A native of the Eaſt Indies. 31. C. *guineenſis.* Willd. 32. "Leaves toothed; root-ones ſcabrous, inverſely egg-ſhaped; thoſe of the ſtem lanceolate, villous, ſomewhat pinnatifid at the baſe; ſtem panicled; flowers in corymbs; calyx-ſcales lanceolate; outer ones villous." *Root* annual. *Stem* a foot and half or two feet high, erect, villous. *Root-leaves* an inch and half or two inches long, obtuſe, remotely ſerrated; lower ſtem-leaves inverſely egg-ſhaped, an inch long, widely-toothed, deeply auriculate-toothed at the baſe; thoſe of the branches half an inch long, lanceolate, villous, toothed, ſomewhat pinnatifid at the baſe; teeth profound; teeth of the baſe quite entire, not ſerrated as in the preceding. *Flowers* in a terminal corymb; calyx-ſcales lanceolate, acute; outer ones ſhorter, villous. Nearly allied to the preceding, but differs in the form of the calyx, and the teeth of the lower leaves. A native of Guinea. 32. C. *amplecicaulis.* Lam. 10. Willd. 35. "Leaves lanceolate, nearly embracing the ſtem, ſomewhat toothed, hairy; ſtem branched, divaricated; peduncles one-flowered." *Root* annual. *Stem* from half a foot to a foot high. *Root-leaves* inverſely egg-ſhaped, toothed; thoſe of the ſtem oblong or lanceolate, remotely toothed, almoſt entire towards the top of the branches. *Flowers* reſembling thoſe of C. aurita; peduncles axillary, ſolitary, an inch or an inch and half long. A native of the Eaſt Indies. 33. C. *obliqua.* Willd. 34. (Erigeron obliquum; Linn. Mant. 572.) "Leaves egg-ſhaped, nearly embracing the ſtem, finely toothed, oblique; ſtem much branched: peduncles one-flowered." *Root* annual. *Stem* three inches long, erect, cylindrical, hairy. *Leaves* alternate, veined, not wrinkled, fragil, beſet with a few ſcattered hairs. *Flowers* yellow, ſolitary, numerous; calyx cylindrical, pubeſcent; ſcales numerous, equal, awl-ſhaped, approximate; florets of the circumference ſcarcely conſpicuous, numerous; ſtigmas of the diſk erect, of the circumference ſpreading. A native of the Eaſt Indies. 34. C. *orientalis.* Willd. 35. (C. orientalis Aſteris attici folio; Tourn. Cor. 35.) "Leaves ſcabrous, ſerrated; lower ones inverſely egg-ſhaped, petioled; upper ones lanceolate, ſeſſile; flowers terminal, cluſtered." *Root* perennial. *Stem* cylindrical, ſtriated, hiſpid-ſcabrous, branched at the upper part; branches ſhort, ſimple. *Flowers* yellow, crowded, in a ſort of corymb at the top of the ſtem and branches; calyx-ſcales awl-ſhaped. A native of Armenia. 35. C. *ſicula.* Willd. 36. (Erigeron ſiculum; Linn. C. ſicula annua, foliis atro-virentibus; Boc. Sic. 62. tab. 31. fig. 4. Moriſ. hiſt. 3. 115. tab. 20. fig. 28. Pluk. phyt. 168. fig. 2.) "Leaves linear-lanceolate, ſcabrous, nearly entire, revolute at the edges; ſtem panicled; peduncles one-flowered, leafy; lower calyx-ſcales lax." *Root* annual. *Stems* red. *Flowers* ſmall; peduncles covered with minute linear, recurved leaves. In other reſpects reſembling erigeron graveolens, but without a ray. Allied alſo to inula pulicaris. A native of Sicily and the ſouth of France. 36. C. *fœtida.* Willd. 37. (Erigeron fœtidum. Linn. Senecio africanus perennis; Pluk. alm. 343. tab. 223. fig. 3.) "Leaves linear, attenuated at the baſe, mucronate; corymbs peduncled, cloſe, terminal." *Root* perennial, too nearly allied to inula fœtida, but has no ray. A native of Africa. 37. C. *pungens.* Lam. 21. Willd 38. (C. memphitica; Vaill. act. 1719. p. 501.) "Leaves tricuſpidate, awl ſhaped, pungent; ſtem panicled, angular, ſmooth." *Stem* a foot high, branched. *Leaves* alternate, diſtant; two lateral ſegments very ſhort. *Flowers* yellow, large, ſolitary, terminal; calyx top-ſhaped or oblong, imbricated; ſcales egg-ſhaped, ſmooth; inner ones mucronate; down reddiſh, the length of the calyx. A native of Egypt, about Grand Cairo.

* * *Stems ſhrubby.*

38. C. *ſaxatilis.* Linn. Sp. Pl. 3. Mart. 4. Lam. 23. Willd. 40. (Helichryſo ſylveſtri ſimilis; Bauh. Prod. 123. Elichryſum ſylveſtre latifolium; Tourn. 452. Helichryſum capitulis ſingularibus brevibus; Mor. hiſt. 3. [illegible] . H[illegible]he; Bocc. Muſ. 142. tab. 104. Chry[illegible] major; Barrel. Ic. 425.) "Leaves [illegible] ſomewhat toothed; peduncles very long, one-flowered." *Root* perennial. *Stems* about a foot high, ſlender, branched, cottony, a little procumbent when young. *Leaves* an inch and half long, two lines broad, green above, whitiſh underneath. *Flowers* yellow, ſolitary, on long peduncles; calyx-ſcales oblong, ſomewhat ſcarious at the tip, lax. A native of Spain, Italy, the South of France, Paleſtine, &c. 39. C. *rupeſtris.* Linn. Mant. 113. Mart. 6. Willd. 41. (C. ſaxatilis β. Lam. C. tomentoſa; Forſk. Ægyp. 75.) "Leaves ſpatulate, ſomewhat toothed, downy; peduncles elongated, one-flowered." Very like the preceding, but the flowering ſtems have axillary branches of ſmaller leaves. *Leaves* broader, ſhorter, more obtuſe, all except the lowermoſt white on both ſides. *Flowers* yellow; peduncles ſhorter and thicker, with one or two lanceolate, not briſtle-ſhaped, bractes; calyx ſcales not acute and patulous, but rather obtuſe and cloſely imbricated; outer ones egg-ſhaped, brown at the tip; middle ones linear, obtuſe, with a brown line on the back. A native of Arabia. 40. C. *ſordida.* Linn. Mant. 466. Mart. 3. Lam. 22. Willd. 39. (Gnaphalium ſordidum; Linn. Sp. Pl. Elichryſum ſylveſtre anguſtifolium, capitulis conglobatis; Bauh. Pin. 264. Stæchus citrina ſpuria, longioribus foliis; Bar. Ic. 368. & 277.) "Leaves linear, quite entire; peduncles long, three-flowered." Nearly allied to C. ſaxatilis. *Stem* reſembling that of lavender, about a foot high, ſlender, cottony. *Leaves* very narrow, ſoft, cottony, whitiſh. *Flowers* ſmall; peduncles long, ſlender, cottony; calyxes conic; ſcales imbricated, a little ſcarious at the tip. A native of the South of France and Italy. 41. C. *ericoides.* Lam. 51. Willd. 43. "Leaves linear, revolute, downy underneath; flowers globular, ſolitary, terminating the branches." *Stem* much branched; branches downy near the top. *Leaves* reſembling thoſe of phylica ericoides, ſmall, numerous, approximate, ſcattered, ſpreading. *Flowers* at the top of the lateral branches, which are ſo diſpoſed as to give the ſtems the appearance of being covered with flowers; calyx-ſcales linear, ſcarcely imbricated; outer ones downy on the back; down reddiſh. A native of Peru. 42. C. *thyoides.* Lam. 42. Illus. Pl. 697. fig. 5. Willd. 44. "Leaves embracing the ſtem, egg-ſhaped, acute, keeled, compreſſed, imbricated in two rows; flowers ſolitary, ſeſſile, lateral." A very ſingular plant in the form and diſpoſition of its leaves, with ſomewhat of the habit of a Thuia. *Stem* a foot and half high, cylindrical, cottony towards the ſummit; branches in two rows, gradually diminiſhing in length from the bottom of the ſtem to the top. *Leaves* ſmall, numerous, concave, villous on the inſide. *Flowers* axillary; calyx-ſcales few, oblong, ſmooth and even; down reddiſh. A native of Peru, found by Joſeph Juſſieu. 43. C. *cupreſſiformis.* Lam. 43. Ill. Pl. 697. fig. 3. Willd. 45. "Whole plant ſmooth; leaves minute, inverſely egg-ſhaped, keeled, imbricated in four rows; flowers ſolitary, terminal." A plant as ſingular as the preceding, with the habit and foliage of a cypreſs, and the flowers of an Athanaſia. *Stem* rather thick, ſtiff, ſlender branched. *Leaves* thickly covering the branches. *Flowers* yellow, ſolitary, ſeſſile; calyx cylindrical; ſcales imbricated, obtuſe, inner ones the longeſt. Found by Commerſon in the Straits of Magellan. 44. C. *lycopoides.* Lam. 44. Ill. Pl. 697. fig. 2. Willd. 46. "Leaves awl-ſhaped, imbricated, preſſed cloſe to the branches; flowers ſolitary, terminal." A ſhrub ſix or ſeven inches high. *Stem* ſtiff; branches erect, generally faſciculated ſo as to reſemble lycopodium ſelago. *Leaves* three lines long, ſmooth, convex at the back, with two lateral furrows. *Flowers* white or lemon-coloured, ſeſſile; calyx-ſcales imbricated, ſimilar to the leaves but ſmaller; down white, twiſted and appearing curled. Found by Commerſon in the Iſle of Bourbon. 45. C. *bryoides.* Lam. 45. Willd. 47. "Proſtrate; leaves linear, crowded, hoary underneath; branchlets terminated with a ſeſſile flower." A ſmall ſhrub. *Stem* divided into numerous, ſhort, procumbent branches, throwing out fibrous roots; branches erect, in cloſe tufts ſomewhat in the manner of a Bryum. *Leaves* ſmall, numerous, placed very near each other, green above, whitiſh and cottony underneath. *Flowers* yellow, ſolitary; calyx almoſt cylindrical, containing from ſix to eight florets; ſcales imbricated, oblong; down the length of the calyx. Found by Commerſon in the Straits of Magellan. 46. C. *linearifolia.* Lam. 49. Willd. 48. "Smooth; leaves linear, nearly entire, narrowed towards the baſe; racemes ſhort, leafy, terminal." A ſmall much-branched ſhrub; branches ſlender, leafy towards the top, ſlightly ſtriated. *Leaves* an inch long, two lines broad. *Flowers* ſeſſile or nearly ſo; calyx oblong, imbricated; inner ſcales linear-lanceolate, white and ſcarious at the edges; down reddiſh, the length of the calyx. A native of the Iſle of Bourbon. 47. C. *punctata.* Willd. 49. "Leaves linear, acuminate, attenuated at the baſe, ſlightly marked with concave dots; peduncles very long, one-flowered." *Branches* cylindrical, ſtriated, ſmooth. *Leaves* an inch and half long, alternate, crowded, ſomewhat fleſhy, rather ſcabrous, quite entire and ſcabrous at the edges. *Peduncles* at leaſt half a foot long, ſolitary or in pairs, beſet with awl-ſhaped diſtant ſcales; calyx-ſcales lanceolate, acute; down reddiſh. A native of Chili. 48. C. *canarienſis.* Willd. 50. "Leaves linear, attenuated at the baſe, rather obtuſe, ſerrated; corymbus terminal." *Branches* cylindrical; younger ones pubeſcent. *Leaves* alternate, crowded, ſpreading, green on both ſurfaces, ſomewhat ſcabrous. *Flowers* yellow; peduncles ſcaly; calyx-ſcales oblong, cloſely imbricated. A native of the Canaries. 49. C. *incana.* Willd. 51. (Erigeron incanum; Vahl. Symb. 1. 72.) "Leaves linear, attenuated at the baſe, ſomewhat toothed, downy; corymbus terminal." *Branches* downy. *Leaves* ſeſſile, approximate, rather acute, a little revolute at the margin. *Corymbs* many-flowered; calyx-ſcales linear, ſomewhat villous; down ferruginous, longer than the calyx. A native of Arabia Felix. 50. C. *inuloides.* Mart. 25. Willd. 52. Hort. Kew. 3. 182. (Chryſocoma dichotoma; Linn. jun. Supp. 359. Jacq. Ic. Rar. 1. tab. 171.) "Leaves wedge-ſhaped-linear, obtuſe, crenate-toothed, ſmooth; anthers two-briſtled." *Stem* ſmooth, proliferous, dichotomouſly branched. *Leaves* rather ſhort, a little obtuſe, ſomewhat ſcabrous, with minute points.

Flowers yellow, in terminal ſimple corymbs; peduncles hirſute; bractes awl-ſhaped; calyx purpliſh. A native of rocky ground in the iſland of Teneriſſe. 51. C. *tomentoſa.* Mart. 31. Mill. Dict. Houſt. MSS. "Leaves oblong-egg-ſhaped, downy, cinereous underneath, flowers terminal, on branching peduncles." *Stem* ten or twelve feet high, much branched. *Leaves* alternate, on ſhort petioles. *Flowers* white, in looſe unilateral ſpikes. A native of La Vera Cruz in New Spain. 52. C. *chryſocomoides.* Willd. 53. Desfont. Atl. 2. 269. tab. 232. "Leaves linear, quite entire, villous; hairs preſſed cloſe; peduncles leafy, one-flowered." Whole plant cinereous-green, cloathed with ſhort ſoft hairs preſſed cloſe to the ſurface. *Stems* a foot and half high, ſlender, branched. *Leaves* ſpreading. *Flowers* in looſe panicles, on filiform peduncles; calyx ovate-cylindrical, ſcales linear, awl-ſhaped, imbricated, pubeſcent, membranous at the edges; florets of the circumference very ſmall, ſcarcely conſpicuous, without teeth. A native of Barbary. 53. C. *coronopus.* Lam. 35. Willd. 54. "Viſcid leaves linear-lanceolate, ſerrated ſerratures oblong, turned upwards; flowers globular in terminal corymbs." 54. C. *glutinoſa.* Lam. 32. "Leaves lanceolate, ſerrated, green on both ſurfaces; viſcid when young." A ſhrub four or five feet high, ſmooth. *Branches* lax, cylindrical, ſlightly ſtriated, leafy towards the ſummit. *Leaves* ever-green, petioled, acute, ſhining. *Flowers* yellow, numerous, ſmall, in a compound terminal corymb; calyx roundiſh, imbricated with egg-ſhaped ſcales; florets of the circumference very ſmall; down white, ſhort. A native of the Iſle of France. 55. C. *appendiculata.* Lam. 31. Willd. 66. "Leaves lanceolate, ſerrated, downy underneath, appendicled at the baſe." *Branches* tubercled, cottony towards the ſummit. *Leaves* near four inches long, about an inch broad, green above, cottony and whitiſh underneath, furniſhed at the baſe with ſome narrow appendages which are decurrent along the petiole. *Flowers* yellow, numerous, in a compound terminal corymb; peduncles and calyx cottony; bractes at the diviſions of the peduncles linear. Found by Commerſon in the Iſle of Bourbon. 56. C. *ſalicifolia.* Mart. 32. Lam. 33. Willd. 55. "Leaves linear-lanceolate, quite entire, revolute at the edges, attenuated upwards and downwards, downy underneath, corymb terminal, compound." *Branches* cylindrical, tubercled; younger ones downy. *Leaves* reſembling thoſe of Salix viminalis, two inches long, alternate, petioled. *Corymb* divaricated; peduncles downy; calyxes cylindrical, imbricated; outer ſcales egg-ſhaped, pubeſcent; inner ones longer, linear, ſmooth. There is a variety with very narrow, almoſt filiform leaves. 57. C. *laurifolia.* Lam. 34. Willd. 56. "Leaves oblong-lanceolate, narrowed at the baſe into a petiole, nearly entire; corymb terminal, compound, ſpreading." A very large ſhrub. *Branches* cylindrical, almoſt ſmooth, leafy on their upper part. *Leaves* about ſix inches long, rather more than an inch broad, ſcattered, ſlightly pubeſcent, ſometimes ſlightly crenulate. *Flowers* numerous, globular; peduncles cloathed with ſhort, woolly hairs; calyx-ſcales ovate-lanceolate, almoſt ſmooth; down reddiſh. Found by Commerſon in the Iſle of Bourbon. It ſeems to have ſome affinity with Baccharis arborea of Linnæus. There is a variety with ſmooth leaves broader at the top, ſmaller flowers and longer down, which perhaps may prove a diſtinct ſpecies. 58. C. *uniflora.* Mart. 38. Mill. Houſt. MSS. "Leaves lanceolate, acute, ſeſſile; flowers ſolitary, lateral, calyxes coloured." *Stem* eight or ten feet high, with numerous, long, ſlender branches. *Leaves* three inches long, three quarters of an inch broad in the middle. *Leaves* growing cloſe to the ſtems of the ſmaller branches. *Flowers* white, with a purple calyx, ſitting cloſe to the baſe of the leaves, one at each joint of the branch. A native of Carthagena in New Spain. 59. C. *purpuraſcens.* Mart. 42. Willd. 9. Swartz. prod. 112. (C. odorata minor: Brown. Jam. 318. C. major odorata; Sloan. Hiſt. 1. 258. tab. 158. fig. 1.) "Leaves ovate-lanceolate, ſerrated, ſomewhat downy; ſtem ſomewhat herbaceous, ſimple below, corymbous above; flowers egg-ſhaped." *Stem* four or five feet high (ſixteen or twenty inches; Brown.) *Leaves* on the ſtem and lower branches four inches long, one inch broad in the middle, on ſhort petioles; on the upper branches much narrower, acute. *Flowers* purple, in round terminal bunches. A native of Jamaica. 60. C. *trinervis.* Mart. 37. Lam. 13. Willd. 10. "Leaves egg-ſhaped, ſmooth, three-nerved, quite entire, ſeſſile; flowers in terminal ſpikes; ſtem ſhrubby." Mill. "Leaves ovate-lanceolate, quite entire, ſmooth, three-nerved; ſtem-leaves alternate, thoſe of the branches nearly oppoſite." Lam. *Stem* ſix or ſeven feet high, dividing into ſeveral woody branches. *Flowers* white. Sent by Robert Millar from Carthagena in New Spain. Miller. *Stem* ſmooth, leafy, full of pith, with numerous lateral and axillary branches. *Leaves* acute, on very ſhort petioles. *Flowers* in a naked, moderate ſized, panicle at the ſummit of the ſtem and branches; calyx ſmooth, imbricated with egg-ſhaped ſcales; down reddiſh, longer than the calyx. Found by Commerſon in Brazil. It perhaps may be doubted whether Millar's be the ſame plant. 61. C. *ſerrulata.* Lam. 14. Willd. 11. "Leaves ovate-lanceolate, broader at the baſe, acutely ſerrated, petioled, nearly ſmooth; corymbs branched, terminal." *Stem* two or three feet high, hard, full of pith, cylindrical, almoſt ſmooth, branched. *Leaves* alternate, acute, three-nerved. *Calyx* ſmooth, imbricated; down reddiſh. A native of Brazil. 62. C. *madagaſcarienſis.* Lam. 15. Willd. 12. "Leaves lanceolate-linear, diſtantly ſerrated, ſmooth; panicle cymous, lax, terminal." *Leaves* three or four inches long, four or five lines broad, erect, quite ſmooth, on ſhort petioles. *Flowers* ſmall; calyx ſhort, ſmooth, imbricated; down reddiſh. A native of Madagaſcar. 63. C. *candida.* Linn. Sp. Pl. 12. Mart. 13. Lam. 19. Willd. 16. (C. cretica fruticoſa, folio molli candidiſſimo; Tourn. Cor. 33. C. ſaxatilis folio filaginis; Buxb. Cent. 2. 23. tab. 17. Jacobæa cretica Incana; Barr. Ic. 217.) "Leaves egg-ſhaped, downy; flowers crowded; peduncles lateral and terminal." Whole plant white and cottony. *Stem* ſomewhat ſhrubby, ſix inches high or more, rather ſlender, erect, cylindrical. *Leaves* on long petioles, entire, ſoft. *Flowers* purple; peduncles one, two, or three-flowered; bractes oblong, ſeſſile, ſituated juſt below the calyx; calyx ſhort, imbricated; ſcales oblong, lanceolate, lax. A native of the iſland of Candia. Linnæus mentions a rayed variety. 64. C. *verbaſcifolia.* Willd. 17. (C. verbaſci foliis ſerratis; Tourn. Inſt. 455. After tomentoſus luteus verbaſci folio; Bocc. Sic. 60. tab. 31. fig. 2. After raguſinus; Zann. Hiſt. 33.) "Leaves egg-ſhaped, petioled, crenate, obtuſe, downy, wrinkled with veins; peduncles one-flowered, ſolitary, terminal and axillary, thickened upwards." *Stems* like thoſe of C. candida. *Leaves* an inch, or an inch and half long, on long petioles. *Flowers* yellow. In other reſpects ſimilar to the preceding. A native of Sicily, Greece, and Armenia. 65. C. *balſamifera.* Linn. Sp. Pl. 13. Mart. 15. Lam. 11. Willd. 18. (C. odorata; Rumph. Amb. 6. tab. 24. fig. 1.) "Leaves oblong-lanceolate, doubly toothed, acute, downy underneath, wrinkled with veins; petioles toothed; corymb terminal, divaricated." *Stem* from four to ſix feet high, branched. *Leaves* large, profoundly toothed at the baſe, where they appear pinnatifid,

tifid, very ſoft; upper ones entire. *Flowers* in terminal panicled racemes; peduncles and calyx cloathed with a fine, whitiſh cottony down; calyx-ſcales narrow, awl-ſhaped; down reddiſh, longer than the calyx. A native of the Eaſt Indies. It has an aromatic ſmell, reſembling that of ſage. 66. C. *chinenſis*. Linn Sp. Pl. 16. Mart. 18. Lam. 4. Willd. 23. Lour. Cochin. 496. Burm. Ind. 179. (Senecio amboinicus; Rumph. Amb. 6. 36. tab. 14. fig. 2.) "Leaves lanceolate-egg-ſhaped, reflex-ſerrated, downy underneath; flowers terminal, cluſtered." *Stem* ſomewhat ſhrubby, four feet high, erect, cylindrical, ſmooth, [illegible] at the top. *Leaves* hardiſh, petioled, alternate. [illegible]llow, peduncled, terminal. *Receptacle* ſomewhat [illegible]ur. *Flowers* ſeldom more than three together. Linn. The plant deſcribed by La Marck, which is cultivated in the Paris garden, has a ſtem only a foot high, and blueiſh purple flowers. In other reſpects it correſponds with the above deſcription. 67. C. *corymboſa*. Mart. 33. Mill. Houſt. MSS. "Arboreſcent; leaves lanceolate; flowers in terminal corymbs, on branching peduncles." *Stem* fourteen or ſixteen feet high, divided at the top into many woody branches. *Leaves* alternate, on ſhort petioles. *Flowers* white. Sent by Dr. Houſton from La Vera Cruz in New Spain. 68. C. *baccharis*. Mart. 41. "Leaves ovate-oblong, obtuſe, ſerrated, half embracing the ſtem; flowers in terminal corymbs." *Stem* ten or twelve feet high, ſending out many ſtrong woody branches. *Flowers* purple. A native of Campeachy. 69. C. *tortuoſa*. Linn. Hort. Clif. 405. Mart. 12. Willd. 57. "Stem crooked; leaves ovate-oblong, quite entire; racemes reflexed." *Branches* ſomewhat hirſute, ſtriated, ſimple. *Leaves* veined, ſcabrous on both ſurfaces, on very ſhort petioles. *Flowers* in ſimple, ſhort, terminal, and axillary racemes, alternate, ſeſſile, turned upwards; calyx roundiſh, imbricated; ſcales egg-ſhaped, inner ones lanceolate; down ſetaceous, faſtigiate. A native of La Vera Cruz. 70. C. *ſcandens*. Mart. 36. Mill. Houſt. MSS. "Leaves lanceolate, ſcabrous, nerved, ſeſſile; racemes recurved; flowers aſcending; peduncles lateral; ſtem climbing." *Stem* fourteen or ſixteen feet high, much-branched. *Leaves* the ſize of thoſe of the bay tree, and full as thick in their texture. *Flowers* white, in long unilateral racemes. A native of La Vera Cruz. 71. C. *rigida*. Mart. 43. Willd. 58. Swartz. Prod. 113. "Leaves petioled, inverſely egg-ſhaped, entire, ſcabrous, veined underneath; ſpikes zig-zag; flowers unilateral, in pairs." A native of Jamaica. 72. C. *amygdalina*. Lam. 38. "Leaves petioled, ovate-lanceolate, ſerrated, ſomewhat downy; flowers in a terminal corymb." *Leaves* reſembling thoſe of the almond-tree, much veined underneath. *Calyx* almoſt ſmooth, ſhort, imbricated; ſcales lanceolate, a little ſcarious at the edges; down reddiſh. Found by Commerſon in the Iſle of Bourbon. There is a variety with nearly ſeſſile leaves, cloathed on both ſurfaces with a whitiſh almoſt ſilky down. 73. C. *pedunculata*. Mart. 40. "Leaves ovate-lanceolate, three-nerved; peduncles very long, terminal; flowers in a corymb." *Stem* ſix or ſeven feet high, branched. *Leaves* ſmooth, alternate, on ſhort petioles. *Flowers* purple; calyx-ſcales ſhort, chaffy. A native of Campeachy. 74. C. *melaſtomoides*. Lam. 40. "Leaves egg-ſhaped, ſeſſile, toothed, three-nerved, naked and wrinkled above, clothed with a ſilky down underneath." *Leaves* alternate, ſometimes five-nerved, an inch and half long. *Flowers* collected into a denſe terminal corymb; calyx-ſcales linear-acute, almoſt equal, a little ſcarious at the edges; down reddiſh, a little longer than the calyx. Found by Commerſon in the Iſle of Bourbon. 75. C. *lithoſpermifolia*. Lam. 41. Willd. 62. "Leaves lanceolate, toothed at the tip, hairy on both ſurfaces, crowded; inner calyx-ſcales dry." A humble ſhrub, not more than four or five inches high. *Stem* branched; branches leafy at the ſummit. *Leaves* narrowed towards the baſe, almoſt three-nerved, near an inch and half long. *Flowers* in a terminal corymb; peduncles villous, with narrow bractes; calyx-ſcales linear-acute; outer ones villous. Found by Commerſon in the Iſle of France. 76. C. *heliotropifolia*. Lam. 37. Willd. 63. "Leaves ſeſſile, oblong, quite entire, ſomewhat downy; corymb terminal, villous; flowers cluſtered." *Leaves* four or five inches long, one inch broad, growing near each other at the top of the branches, clothed on both ſurfaces with a cottony reddiſh down. *Flowers* from four to ſix in a corymb; peduncles villous; calyx-ſcales linear, villous; down reddiſh, longer than the calyx. Found by Commerſon in the Iſle of Bourbon. 77. C. *panamenſis*. Willd. 64. "Leaves ſeſſile, ovate-lanceolate, ſcabrous, quite entire, triply-nerved; panicle terminal." *Stem* cylindrical, ſtriated, ſmooth. *Leaves* an inch and half long, reticularly veined. *Peduncles* long, one or two-flowered; calyx-ſcales oblong, adpreſſed; down reddiſh. 78. C. *pyrifolia*. Lam. 36. Willd. 65. "Leaves egg-ſhaped, acuminate, ſomewhat toothed, ſmooth; corymb panicled, lax." *Branches* ſmooth. *Leaves* alternate, petioled. *Flowers* whitiſh; calyx ſhort, ſmooth, imbricated; down reddiſh, longer than the calyx. Found by Commerſon in the iſland of Java. 79. C. *argentea*. Lam. 24. Willd. 67. "Leaves egg-ſhaped, tomentous-ſilky, half embracing the ſtem; flowers ſeſſile, terminal, cluſtered." Abundantly clothed, like a gnaphalium, with a ſilvery ſilky down. *Stem* cylindrical, ſimple. *Leaves* ſcattered, numerous. *Flowers* yellow, two or three together; florets ſhorter than the calyx; calyx-ſcales narrow, erect, bearded." Found by Commerſon in the Iſle of Bourbon. 80. C. *populifolia*. Lam. 25. Willd. 68. "Leaves heart-ſhaped, petioled, downy, quite entire; calyxes hemiſpherical." *Branches* ſhort, thick, ſtiff, knotty, cottony, ſtriated, leafy towards the ſummit. *Leaves* acute. *Flowers* large, from five to ſeven in a terminal corymb; peduncles an inch long, ſimple, thickened under the calyx, angular; calyx cottony, imbricated; florets numerous; down reddiſh, longer than the calyx, ſtiffiſh. Found by Commerſon in the Iſle of France. 81. C. *carolinenſis*. Willd. 69. Jacq. Ic. rar. 3. tab. 585. "Leaves ovate-lanceolate, quite entire, hoary, downy underneath; corymb terminal, compound." *Stem* five feet high. *Branches* cylindrical, downy. *Leaves* at leaſt two inches long, petioled. *Flowers* violet, ſmall; calyx-ſcales oblong, downy. A native of Carolina, Florida, and the Bahama Iſlands. 82. C. *odorata*. Linn. 15. Mart. 17. Lam. 26. Willd. 70. (C. verbaſci folio undulato; Plum. Sp. 9. Burm. Amer. tab. 97. Tourn. Inſt. 455. C. major odorata, five baccharis: Sloan. Jam. Hiſt. 1. 258. tab. 152. fig. 1. β C. folio verbaſci dentato; Plum. Sp. 9. Burm. Amer. tab. 97. Tourn. 455.) "Leaves egg-ſhaped, petioled, ſomewhat toothed, downy; flowers aggregate, in a corymb; calyxes hemiſpherical." An odoriferous ſhrub, from four to ſix feet high. *Stem* erect, branched. *Leaves* four or five inches long, more than two inches broad, ſome entire, others ſlightly toothed. *Flowers* purple: peduncles ſhort, cottony; calyx imbricated, cottony; ſcales ſhort, rather obtuſe. A native of South America. 83. C. *arboreſcens*. Linn. Sp. Pl. 18. Mart. 20. Lam. 27. Willd. 71. Plum. Sp. 10. Burm. Amer. tab. 132. fig. 2. (C. fruticoſa flore pallido purpureo; Sloan. Jam. 124. Hiſt. 1. 257. Eupatorium erectum hirſutum, foliis oblongis rugoſis Brown. Jam. 313.) "Leaves egg-ſhaped, quite entire, acute, downy underneath; ſpikes recurved, unilateral, bractes reflexed.” Four or five feet high. *Stem* erect, branched towards the top; branches divaricated, ſub-divided, bending down, diverging, villous, with a blackiſh ſhaggineſs. *Leaves* two inches long, alternate, on ſhort petioles, wrinkled, green above; pale, pubeſcent, and nerved underneath. *Flowers* pale purple, in a unilateral ſpike, or rather raceme. A native of South America. 84. C. *ſcorpioides.* Lam. 28. “Leaves ovate-lanceolate, petioled, entire, even-ſurfaced; ſpikes unilateral, revolute, naked.” Nearly allied to the preceding, and perhaps only a variety, but its leaves are even-ſurfaced above, and almoſt ſmooth underneath. *Flowers* in linear racemes, recurved like the tail of a ſcorpion; calyx-ſcales lanceolate; inner ones a little villous at the tip; down white. Found by Commerſon in Brazil. 85. C. *fruticoſa.* Linn. Sp. Pl. 17. Mart. 21. Lam. 29. Willd. 72. (C. fruteſcens, cydoniæ folio; Plum. Sp. 9. Burm. Amer. tab. 95. fig. 1. Tourn. 455.) “Leaves egg-ſhaped, quite entire, obtuſe; flowers ſeſſile, alternate; branchlets zig zag.” A petty ſhrub, reſembling roſemary, but with longer and more ſlender branches. *Leaves* numerous, alternate, petioled, white with down. *Flowers* purple, axillary, ſolitary. A native of South America. 86. C. *inciſa.* Mart. 29. Willd. 43. Hort. Kew. 3. 184. “Leaves egg-ſhaped, ſomewhat heart-ſhaped, hairy-viſcid, toothed, auricled at the baſe; receptacle honey-combed.” Whole plant clothed with viſcid hairs. *Stem* three feet high. *Leaves* an inch long, petioled, deeply cut. *Corymbs* terminal, few-flowered, on long peduncles. A native of the Cape of Good Hope, found by Francis Maſſon. 87. C. *arbutifolia.* Lam. 52. Willd. 74. “Leaves egg-ſhaped, veined, ſharply toothed, crowded; flowers ſeſſile, terminal, globular.” A ſmooth ſhrub, a foot and half high, or more. *Branches* erect, generally faſciculated, leafy on their upper part, naked towards the baſe, and marked with the ſcars of fallen leaves, with a decurrent line on each ſide. *Leaves* ſcattered, ſeſſile, approximate, narrowed at the baſe. *Flowers* rather large, cluſtered; calyx imbricated; ſcales ovate-lanceolate; down reddiſh. Found by Joſeph Juſſieu in Peru. 88. C. *myrſinites.* Lam. 48. Willd. 75. “Leaves lanceolate, two-toothed; flowers globular, ſomewhat cluſtered, terminal.” *Branches* ſlender, leafy on the upper part, ſomewhat angular. *Leaves* ſmall. *Flowers* very ſmall, almoſt ſeſſile; calyx imbricated; ſcales egg-ſhaped, acute, ſlightly ciliated on the upper edge. A native of St. Domingo. 89. C. *magellanica.* Lam. 47. Willd. 76. “Smooth; leaves very ſmall, ovate-wedge-ſhaped, obſoletely three-toothed; flowers lateral, ſolitary, terminating the branchlets.” A low, much-branched, ſpreading ſhrub. *Leaves* numerous, approximate, obtuſe. *Flowers* oval, ſeſſile; calyx-ſcales egg-ſhaped. Found by Commerſon in the ſtraits of Magellan. 90. C *cuneifolia.* Lam. 46. Willd. 77. (Erigeron tricuneatum; Linn. jun. Supp. ?) “Smooth; leaves wedge-ſhaped, toothed towards the tip; flowers axillary and terminal, ſomewhat cluſtered.” Much-branched, viſcid. *Leaves* ſeſſile. *Flowers* nearly ſeſſile; calyx egg-ſhaped, imbricated; ſcales ovate-acute, a little ſcarious, fringed towards the tip; down reddiſh, longer than the calyx. Found by Commerſon near Monte Video, and at the ſtraits of Magellan. The younger Linnæus's plant was found by Mutis in New Mexico. 91. C. *retuſa.* Lam. 39. Willd. 78. “Leaves ovate-wedge-ſhaped, retuſe, crenated near the tip, pubeſcent; flowers globular, terminal, and axillary, forming a corymb.” *Stem* a foot and half or two feet high; branches numerous, cylindrical, naked, and knotty below, leafy near the ſummit. *Leaves* ſcattered, thickiſh, ſucculent, with three or five longitudinal nerves. *Flowers* whitiſh; peduncles branched, pubeſcent; calyx hemiſpherical, imbricated; ſcales egg-ſhaped, inner ones ſomewhat ſcarious and lacerated at the edges; hermaphrodite florets of the diſk numerous; female ones of the circumference in two or three ranks. Found by Commerſon in the Iſle of Bourbon. 92. C. *buxifolia.* Lam. 50. Willd. 79. “Smooth; branches ſtiff; leaves oblong-egg-ſhaped, quite entire; flowers lateral, ſeſſile.” About four or five feet high. *Branches* erect, cloſe, ſomewhat filiform, angular, tubercled, leafy towards the ſummit. *Leaves* ſix or ſeven lines long, ſcattered, approximate, almoſt ſeſſile, narrowed towards the baſe. *Flowers* axillary, ſolitary; calyx imbricated; ſcales ovate-oblong, ſlightly ciliated near the tip; down whitiſh. Found in Peru by Joſeph Juſſieu. 93. C. *carthagenenſis.* (C. ſpicata; Mart. 39.) “Leaves egg-ſhaped, three-nerved; flowers in axillary ſpikes.” *Stem* ten or twelve feet high, dividing at the top into many woody branches. *Leaves* an inch long, alternate, ſitting cloſe to the branches, acuminate. *Flowers* white. A native of Carthagena in New Spain.

* * *Leaves decurrent.*

Herbaceous or Shrubby.

94. C. *geniſtelloides.* Lam. 56. Willd. 80. (Canambaya; Marg. Braſ. 78.) “Stems ſomewhat ſhrubby, without leaves, nearly ſmooth; rings interrupted by joints, terminated by a ſhort ſcale; flowers ſeſſile, lateral, alternate.” *Stems* from a foot to three feet long. *Wings* between each joint, broader on one ſide than on the other, decuſſated, green. *Flowers* yellow, ſituated at the joints in the upper part of the plant, ſolitary in the axil of the ſcale; calyx round, almoſt ſmooth, imbricated; ſcales ovate-acute; down reddiſh. A native of Peru. 95. C. *articulata.* Lam. 57. Ill. Pl. 697. fig. 4. Willd. 81. “Stem much branched, interruptedly winged; leaves oblong-elliptical, ſhorter than the joints; flowers panicled.” *Stem* a foot and half high; branches compound, ſmooth, viſcid towards the ſummit. *Flowers* pale yellow, ſeſſile, almoſt globular, often cluſtered together in a kind of terminal ſpike or panicle; calyx imbricated, ſcales obtuſe. Found by Commerſon at Monte Video. 96. C. *ſagittalis.* Lam. 58. Willd. 82. “Leaves decurrent, lanceolate, finely toothed, a little ſcabrous, green on both ſurfaces; flowers cluſtered together at the top of the branches.” *Stem* winged as in the two preceding. *Leaves* alternate, two or three inches long. *Flowers* from three to five in a cluſter; calyx ſhort; ſcales egg-ſhaped, ſomewhat pubeſcent; florets numerous; down longer than the calyx. Found by Commerſon at Monte Video. 97. C. *criſpata.* Willd. 83. Vahl. 1. 71. Forſk. Arab. 119. n. 495. “Leaves lanceolate, ſerrate-toothed, naked; peduncles one-flowered; ſtem ſhrubby.” Whole plant ſmooth. *Stem* erect, ſtriated; branches and peduncles with curled tooth-ſinuated wings. *Leaves* an inch and half long, remote. *Flowers* two or three at the top of the branches; peduncles half an inch long; calyx-ſcales linear-lanceolate, the length of the florets in the circumference. A native of Arabia Felix. 98. C. *arabica.* Willd. 84. (Erigeron decurrens; Vahl. Symb. 1. 72.) “Leaves linear, quite entire, downy; flowers panicled.” *Stem* erect, ſtriated, pubeſcent, downy near the top; branches woody. *Leaves* an inch and half long. *Pedicels* capillary, with two minute bractes near the top; calyxes villous; ſcales briſtle-ſhaped, ſhorter than the down. A native of Arabia Felix. 99. C. *thapſoides.* Willd. 85. Marſch. de Biberſt. Fl. Caucas. “Leaves egg-ſhaped, mucronate, downy; lower ones ſerrated; flowers in corymbs.” *Root* perennial. A native of Mount Caucaſus, near the ſhores of the Caſpian ſea. 100. C. *virgata.* Linn. Sp. Pl. 5. Mart. 22. Lam. 53. Willd. 86. (C. helenii folio; Pl. Sp. 9.

Burm. Amer. tab. 98. fig. 2. C. anguſtifolia ſubincana; Brown. Jam. 318. Helichryſum caule alato; Sloan. Jam. 125. Hiſt. 1. 206. tab. 152. fig. 5.) "Leaves linear-lanceolate, finely ſerrated, downy underneath; ſpikes terminal, elongated, interrupted." *Root* perennial, woody. *Stem* about two feet high, erect. *Leaves* five or ſix inches long, alternate, green and ſmooth above, whitiſh and downy underneath. *Flowers* pale purple, ſeſſile, lower ones three together, upper ones ſolitary; calyx oblong, imbricated; ſcales acute, rather hairy. A native of St. Domingo, Jamaica, and Carolina. 101. C. *rugoſa*. Willd. 87. Vahl. Symb. 1. 71. "Leaves elliptical, crenated, downy underneath; flowers in a head." *Branches* woody; wings quite entire, ſmooth on one ſide, very downy on the other. *Leaves* an inch and half long, wrinkled, ſmooth above, downy underneath. *Peduncles* the length of the leaves, from the axils of the upper leaves. A native of Brazil. 102. C. *alopecuroides*. Lam. 54. Willd. 88. Plum. Sp. 9. Burm. Amer. tab. 98. fig. 1. "Leaves egg-ſhaped, finely ſerrated, downy underneath; ſpike terminal, denſe, interrupted at the baſe." *Root* perennial, ſpindle-ſhaped, woody. *Stems* about two feet high; wings green on one ſide, white and downy on the other. *Leaves* alternate; green, ſmooth, ſomewhat wrinkled above, whitiſh and downy underneath. *Flowers* ſeſſile; calyx imbricated, downy at the baſe; inner ſcales longer and ſmooth towards the tip; down rather long. A native of Martinico and Brazil. 103. C. *ſpicata*. Lam. 55. Willd. 809. Cav. Ic. 1. 8. tab. 12. "Stem ſomewhat ſhrubby, ſimple; leaves ovate-lanceolate, finely ſerrated, downy underneath; ſpike terminal, denſe, entire." *Stem* a foot and half high, erect, ſtriated with green and white. *Leaves* from three to four inches long, ſix or eight lines broad, alternate, green and ſmooth above, white and downy underneath. *Flowers* ſeſſile; calyx clothed with a thick down, imbricated; ſcales narrow-lanceolate, inner ones longer. Female florets intermingled with the hermaphrodites. A native of South America. Obſ. As the genera baccharis and conyza now ſtand, this ſpecies belongs to the former. 104. C. *redolens*. Willd. 90. (Gnaphalium redolens; Forſt. Prod. n. 535.) "Leaves lanceolate, quite entire, downy underneath; ſpikes terminal, glomerated." *Stem* woody, branched. *Leaves* half an inch long, obtuſe. *Spikes* half an inch long; calyxes villous. A native of New Caledonia. 105. C. *decurrens*. Linn. Sp. Pl. 6. Mart. 23. Willd. 91. (C. alopecuroides, β. Lam.?) "Leaves lanceolate, finely ſerrated; ſtem ſomewhat dichotomous; flowers axillary, ſeſſile, glomerated." *Root* annual. Whole plant downy. *Stem* about three inches long, erect. A native of the Eaſt Indies.

Obſ. The only eſſential diſtinction between baccharis and conyza conſiſts in the former having the hermaphrodite and female florets intermingled with each other; whereas, in the latter, the female florets are all collected in the circumference, but without rendering the compound flower properly radiate. In dried ſpecimens, it is not always poſſible to determine theſe characters with certainty; ſo that, as La Marck obſerves, ſome of the foregoing ſpecies may belong to baccharis. Juſſieu, Gærtner, and La Marck, are of opinion, that the two genera are ſcarcely diſtinct. The latter, however, ſuggeſts that two genera might be formed out of them, diſtinguiſhed by the form of the calyx: one of them with the calyx of erigeron, *i. e.* not properly imbricated, having linear, nearly equal ſcales in ſeveral ranks; the other with the calyx of eupatorium, *i. e.* ſtrictly imbricated. If any of the ſpecies ſhould be found to have all the florets hermaphrodite, they muſt be referred to eupatorium. Erigeron differs in having a radiate flower.

Willdenow, in the third part of his third volume, publiſhed ſince our article baccharis went to the preſs, has added the following ſpecies to that genus. 1. B. *viſcoſa*, 4. Lam. "Leaves elliptical, rather acute, three-nerved, quite entire, petioled; younger ones viſcid." *Flowers* in terminal, compound, peduncled corymbs. A native of the Iſles Mauritius and Bourbon. 2. B. *arbutifolia*, 6. Vahl. Symb. 3. 97. "Leaves oblong, ſeſſile, rigid, acutely ſerrated, reticularly veined; corymb terminal; flowers cluſtered." A ſmooth ſhrub. A native of Peru. 3. B. *ſeſſiliflora*, 7. Vahl. 3. 97. "Leaves oblong, ſeſſile, toothed, and entire; flowers terminal, ſeſſile." *Flowers* twice as large as thoſe of B. halimifolia. A native of Brazil. 4. C. *villoſa*, 9. Vahl. 3. 98. "Leaves lanceolate, petioled, ſerrated on the upper part, villous-downy underneath." *Branches*, *peduncles*, and *pedicels*, villous-downy. *Corymbs* long, peduncled, faſtigiate; calyx-ſcales briſtle-ſhaped. A native of Arabia Felix. 5. C. *tridentata*, 12. Vahl. 3. 98. "Leaves ſeſſile, wedge-ſhaped, even-ſurfaced, three-toothed at the tip." *Flowers* in terminal and axillary corymbs. A native of Brazil. 6. B. *dioica*, 13. Vahl. 3. 98. tab. 74. "Leaves wedge-ſhaped, ſomewhat retuſe, quite entire, even-ſurfaced, three-nerved; flowers dioicous." *Flowers* from four to ſeven, ſeſſile, cluſtered. A native of Montſerrat and Dominica.

Conyza aſteroides of Linnæus and Martyn is aſter conyzoides of Willdenow. It is excluded from the preſent genus by its radiate flower.

CONZA, in *Geography*, a town of Naples, in the province of Principato Ultra, conſidered as the capital of the province; ſituated at the foot of the Apennines, near the head of the Oſauto; the ſee of an archbiſhop. The chief article of its commerce is marble. Diſtant 48 miles E. of Naples. N. lat. 40° 50′. E. long. 15° 10′.

COOCH BAHAR, or COOS-BAYHAR, a diſtrict of Bahar, in the province of Bengal, ſeparated from that of Rungpore, by the river Durlah. In this diſtrict, an uſage of a very ſingular kind has prevailed from remote antiquity, and actually exiſts at this day. If a reiut, or peaſant, owes a ſum of money, and cannot ſatisfy his creditor, he is compelled to give up his wife as a pledge, and poſſeſſion of her is kept till the debt is diſcharged. It ſometimes happens, according to report, that the wife of a debtor is not redeemed for the ſpace of one, two, or three years; and then, if during her reſidence and connection with the creditor, a family ſhall have been the conſequence, half of it is conſidered as the property of the perſon with whom ſhe lived, and half that of her real huſband. This country has a moſt wretched appearance, and its inhabitants are a miſerable and puny race. Thoſe of the lower ranks, without ſcruple, diſpoſe of their children for ſlaves, to any purchaſer, and for a very trifling conſideration. Nothing is more common, in this unnatural traffic, than to ſee a mother dreſs up her child, and bring it to market, with no other view or hope, than to enhance the price ſhe may procure for it. Indeed the extreme poverty and wretchedneſs of theſe people will ſufficiently appear, when we reflect that the value of the peaſant's ſubſiſtence amounts to no more than one penny a day, even allowing him to make his meal of two pounds of boiled rice, with a due proportion of ſalt, oil, vegetable, fiſh, and chili, the latter of which is a kind of red pepper, in univerſal uſe, made from the "capſicum annuum" of Linnæus. The ſituation of the diſtrict exhibits an union of facts, not unfrequently obſerved, *viz.* the great facility of obtaining food, and at the ſame time the wretched indolence of the lower order of inhabitants. Turner's Thibet, p. 11, &c.

COOGHEN, LEONARD VAN, in *Biography*, a painter, born at Haarlem in 1610, and ſcholar of Jac. Jordaens. He alſo amuſed himſelf with etching, and publiſhed two or three ſets of prints, in which the ſtyle of Salvator Roſa was imitated with the moſt happy ſucceſs. Theſe etchings, ſeveral of which repreſent groups of military figures, are dated from 1664 to 1666. He died in 1681. Heinecken.

COOK, JAMES, one of the moſt eminent navigators and diſcoverers of unknown territories and ſeas, recorded either in ancient or modern hiſtory, was deſcended from an obſcure family in Northumberland: his father, James Cook, having occupied the humble ſtation of a ſervant in huſbandry, and his mother, whoſe Chriſtian name was Grace, being a perſon of the ſame rank and condition. The ſubject of this article claims a more diſtinguiſhed notice, and a more extended detail of particulars, than we have been accuſtomed to introduce in thoſe biographical ſketches that occur in this work. Independently of the ſingular merit of captain Cook himſelf, to which a peculiar tribute is due, his voyages and diſcoveries are ſo immediately connected with ſcience, both geographical and nautical, as to entitle them to a conſpicuous place in a general Dictionary of the Arts and Sciences. The parents of captain Cook, who were noted in their lowly ſtation for honeſty, ſobriety, and diligence, were ſettled for ſome time before his birth at Marton, a village in the North Riding of Yorkſhire; and in this place their ſon James, deſtined to give celebrity to their name and family, was born on the 27th of October, in the year 1728. Having received the firſt rudiments of education at his native place, he was further inſtructed in writing, and the firſt five rules of arithmetic at Ayton, near which place his father was ſettled in the ſervice of Thomas Skottow, eſq.; and, at the age of 13 years, he was apprenticed to a ſhop keeper, at Staiths, a fiſhing town about 10 miles from Whitby. The ſea, however, was the object towards which he manifeſted an early inclination; and, in conſequence of ſome diſagreement with his maſter, he obtained his diſcharge, and determining to indulge his natural propenſity, he bound himſelf for ſeven years to Meſſrs. Walkers of Whitby, quakers by religious profeſſion, who employed two ſhips in the coal trade. At the expiration of his apprenticeſhip, he continued in veſſels of this deſcription, as a common ſailor, till at length he was appointed mate in one of Mr. John Walker's ſhips. At this time, he was not diſtinguiſhed by any peculiar traits of character, though without doubt he muſt have acquired a conſiderable degree of knowledge in practical navigation. In the ſpring of the year 1755, when hoſtilities commenced between England and France, Mr. Cook, and the ſhip to which he belonged, happened to be in the river Thames; and after concealing himſelf for ſome time, to avoid being impreſſed, he determined to enter voluntarily into the Britiſh navy. His firſt ſituation in his majeſty's ſervice, was on board the Eagle man of war, to the command of which, captain (afterwards ſir Hugh) Palliſer was appointed in October 1755. As an active diligent ſeaman, he recommended himſelf to the captain's notice; and in conſequence of his own acknowledged merit, as well as ſome private interference, he obtained on the 16th of May, 1759, a maſter's warrant for the Grampus ſloop; but this appointment not taking effect, he was made maſter of the Garland, a ſhip which had ſailed before he could join her; and therefore, on the 19th of May, he was appointed to the Mercury. This ſhip was deſtined to North America, where ſhe joined the fleet under the command of ſir Charles Saunders, which, in conjunction with the land forces under general Wolfe, was engaged in the famous ſiege of Quebec. As it was neceſſary to take the ſoundings in the river St. Lawrence, between the iſland of Orleans and the north ſhore, directly in the front of the French fortified camp at Montmorency and Beauport, Mr. Cook was recommended by captain Palliſer, who well knew his ſagacity and reſolution, to this difficult and hazardous ſervice. He performed it, with great perſonal riſk, to the ſatisfaction of his employers; and furniſhed the admiral with a complete and correct draught of the channel and ſoundings. Before this time, it is thought that he had ſcarcely ever uſed a pencil, and that he had no knowledge of drawing. He afterwards ſurveyed thoſe parts of the river, below Quebec, which navigators had found to be attended with difficulty and danger; this buſineſs was executed with his cuſtomary diligence and ſkill; and when his undertaking was finiſhed, his chart of the river St. Lawrence was publiſhed, with the neceſſary ſoundings and directions for navigating that river. This chart has ſuperſeded the neceſſity of any other. After the expedition to Quebec, Mr. Cook was appointed, by warrant from lord Colvill, maſter of the Northumberland man of war; and in this ſtation, his conduct was ſuch, as to gain him the eſteem and friendſhip of his commander. During the ſtation of his ſhip at Halifax, he read Euclid, and devoted his leiſure hours to the ſtudy of aſtronomy, and other branches of ſcience. In September 1762, the Northumberland came to Newfoundland, to aſſiſt in the recapture of the iſland from the French; and after this ſervice was accompliſhed, Mr. Cook ſurveyed the harbour of Placentia, and the heights of the place, with a diligence which engaged the notice of captain (afterwards admiral) Greaves, the governor of Newfoundland. The governor formed a very high opinion of his abilities and character; and this opinion was amply confirmed by the concurring teſtimony of all the officers under whom he had ſerved. Upon Mr. Cook's return to England, towards the cloſe of the year 1762, he married an amiable woman, who deſerved and enjoyed his tendereſt affection and regard. Early in the year 1763, he accompanied captain Greaves to Newfoundland, as ſurveyor of its coaſts; and having executed the buſineſs that had been aſſigned him, he returned to England. In April 1764, he was appointed, under the orders of commodore Palliſer, marine ſurveyor of Newfoundland and Labradore; and of the ſatisfactory manner in which he executed this office, the charts which he afterwards publiſhed, afford ſufficient evidence. Theſe ſervices were continued till the year 1767; and whilſt he was employed in them, he tranſmitted to the Royal Society an obſervation of the eclipſe of the ſun at Newfoundland, with the longitude deduced from it, (ſee Phil. Tranſ. vol. 57.) from which our navigator appears to have already acquired the character of an able mathematician. But a new and more intereſting ſcene opens upon us in the proſecution of theſe memoirs. A ſpirit of diſcovery had been excited towards the latter end of the 15th century, and in the following century it was very vigorous and active; but ſoon after the commencement of the 17th century, it began to decline: at a ſubſequent period, during the reign of king George II., it again began to revive; and two voyages were performed for the purpoſe of diſcovering a north-weſt paſſage through Hudſon's Bay. But the nobleſt diſplays of this ſpirit were exhibited during the preſent reign: and it was reſerved for Mr. Cook to furniſh the moſt illuſtrious example of its influence. Soon after the peace of 1763, two voyages round the world were undertaken by captains Byron, Wallis, and Carteret, to whom we are indebted for ſeveral diſcoveries, which ſerved to extend the knowledge of geography and navigation; but before the return of the two laſt of theſe commanders, another voyage was projected, on a more extenſive ſcale than either of the former. The tranſit of Venus in 1769, which was likely to be obſerved with the greateſt advantage in ſome of the iſlands of the South Sea, afforded a peculiar inducement to this expedition; and after a variety of preliminary conſultations and debates, Mr. Cook, who was ſtrongly recommended by Mr. Stephens, ſecretary to the admiralty, and by ſir Hugh Palliſer, who had long known his abilities and character, was appointed to the command of it, with the rank of a lieutenant in the royal navy, to which he was promoted on the 25th of May 1768. A veſſel of 370 tons, called the Endeavour, was prepared for this purpoſe; but before the neceſſary arrangements were compleated captain Wallis returned, and upon being conſulted he recommended Port Royal Harbour in George's iſland, now known by the name of Otaheite, as the moſt proper place for the propoſed obſervation of the tranſit. Lieutenant Cook was accompanied by Mr. Charles Green, who had been aſſiſtant to Dr. Bradley at the Royal Obſervatory at Greenwich, and alſo by Joſeph Banks, eſq. now ſir Joſeph Banks, bart. and preſident of the Royal Society, and Dr. Solander, gentlemen whoſe zeal for the promotion of ſcience have been uniform and ardent. Lieutenant Cook had further views in this voyage than the mere obſervation of the tranſit, and accordingly, when that buſineſs was accompliſhed, he was directed to purſue further diſcoveries in the great Southern Ocean. The complement of Cook's ſhip conſiſted of 84 perſons, beſides the commander; ſhe was victualled for 18 months; and furniſhed with 10 carriage and 12 ſwivel guns, together with an ample ſtore of ammunition and other neceſſaries. On the 26th of Auguſt our navigators ſet ſail from Plymouth Sound; and on the 13th of September anchored in Funchiale road, in the iſland of Madeira. Here they were hoſpitably entertained; and having laid in a freſh ſtock of beef, water, and wine, they left the iſland in the night of the 18th of September. In their way to Rio de Janeiro, they had an opportunity of accounting for that luminous appearance of the ſea, which had been often noticed by navigators, and aſcribed to various cauſes. They determined by experiment, fully to their ſatiſfaction, that the flaſhes which they had obſerved proceeded from ſome luminous animal. Their reception at Rio de Janeiro was very different from that which they had met with at Madeira; and it was through mere neceſſity that they were detained there from the 13th of November to the 7th of the following month, when they proceeded on their voyage. On the 14th of January 1769, lieutenant Cook entered the ſtrait of Le Maire, and having contended for ſome time with a violent tide, he anchored on the next day, firſt before a ſmall cove, which was underſtood to be Port Maurice, and afterwards in the bay of Good Succeſs During the continuance of the Endeavour in this ſtation, Mr. Banks, Dr. Solander, Mr. Monkhouſe the ſurgeon, and Mr. Green the aſtronomer, with their attendants and ſervants, and two ſeamen, aſcended the mountains in ſearch of plants. This excurſion has been often related, and the effect of the cold of the climate is well known. (See COLD. For an account of the inhabitants of the deſolate regions adjacent to this ſtrait; ſee LE MAIRE.) It has been a queſtion among former navigators which is the beſt paſſage from the Atlantic to the Pacific ocean; and the doubling of Cape Horn has been ſo much dreaded, that it has been thought more eligible to paſs through the ſtrait of Magalhaens or Magellan. Lieutenant Cook has ſettled this point; for he was no more than 33 days in coming round the land of Terra del Fuego, from the E. entrance of the ſtrait of Le Maire till he had advanced about 12 degrees to the weſtward and 3½ to the northward of the ſtraits of Magalhaens, and during this time the ſhip received ſcarcely any damage; whereas it would have required three months to reach the Pacific ocean through this ſtrait, and in paſſing it his people would have been much fatigued, and the anchors, cables, ſails, and rigging of the veſſel would have been much injured. In ſhort, lieutenant Cook, by ſetting the example of doubling Cape Horn, and by accurately aſcertaining the latitude and longitude of different places, as well as by his inſtructions to future voyagers, has performed the moſt eſſential ſervice to this part of navigation. In the proſecution of the voyage from Cape Horn to Otaheite, ſeveral iſlands were diſcovered, to which were given the names of Lagoon iſland, S. lat. 18° 47'. W. long. 139° 28', Thrumb-cap, S. lat. 18° 35'. W. long. 139° 48', Bow iſland, S. lat. 18° 23'. W. long. 141° 12', the Groups, the eaſternmoſt in S. lat. 18° 12'. W. long. 142° 42', Bird iſland, S. lat. 17° 48'. W. long. 143° 35', and Chain iſland, S. lat. 17° 23'. W. long. 145° 54'. Moſt of theſe iſlands were inhabited; and the verdure, or groves of palm-trees, which were viſible in ſome of them, gave them the appearance of a terreſtrial paradiſe to perſons who had ſo lately witneſſed the dreary coaſts of Terra del Fuego.

On the 13th of April the Endeavour anchored in Port Royal bay, called by the natives "Matavai," in the iſland of Otaheite. Having fixed upon a place proper for accompliſhing the grand object of their commiſſion, they erected an obſervatory, S. lat. 17° 29' 15". W. long. 149° 32' 30", and carried their aſtronomical quadrant, and ſome other inſtruments, on ſhore. On the following day, very much to their ſurpriſe and grief, the quadrant was not to be found. By the judicious and ſpirited exertions of Mr. Banks, the inſtrument was reſtored. The tranſit was obſerved with great advantage. A particular account of the obſervation may be ſeen in the Phil. Tranſ. vol. lxi. p. 397. See VENUS. As we ſhall have occaſion to mention ſome of the leading circumſtances that occurred on this and other viſits to Otaheite, under that article, we ſhall attend lieutenant Cook in his departure from the iſland. Previouſly to their ſetting ſail, Tupia, one of the natives, the prime miniſter of Oberea, when ſhe was in the height of her power, and chief prieſt of the country, who had been a conſtant companion of the Engliſh during their abode on the iſland, came on board the ſhip, with a boy thirteen years of age, and intreated that they might be permitted to proceed with them on their voyage. Lieutenant Cook gladly accepted the propoſal. On the 13th of July the Engliſh weighed anchor, and whilſt they were proceeding on their voyage, Tupia informed lieutenant Cook that at four of the neighbouring iſlands, which he diſtinguiſhed by the names of *Huaheine*, *Ulietea*, *Otaha*, and *Bolabola*, they might procure hogs, fowls, and other refreſhments, in great abundance. Accordingly, having paſſed *Tethuroa*, they approached the N.W. part of Huaheine on the 16th of July, and in the afternoon anchored in a ſmall but excellent harbour on the W. ſide of the iſland, called Owharre; and having procured a variety of neceſſary articles of refreſhment, they ſailed on the 19th for Ulietea, in a good harbour of which the ſhip anchored on the next day.

The lieutenant hoiſted an Engliſh jack on this iſland, and, in the name of his Britannic majeſty, took poſſeſſion of this, and the three neighbouring iſlands, Huaheine, Otaha, and Bolabola, all of which were in ſight. The harbour or bay in which the Endeavour had anchored was called by the native Oopoa, and extends almoſt the whole length of the eaſt ſide of the iſland. In its greateſt extent it is capable of accommodating any number of ſhips. After having ſurveyed the northern and ſouthern parts of this iſland, they ſet ſail on the 24th; but after encountering conſiderable danger and diſcovering ſeveral ſmall iſlands, they returned to Ulietea, and caſt anchor on the 1ſt of Auguſt in a harbour on the weſt ſide of the iſland. Tupia had previouſly apprized them of the formidable character of the inhabitants of Bolabola, but on intercourſe with them, and particularly with Opoony, they found there was no foundation for the terrors which Tupia had endeavoured to excite. Having finiſhed their neceſſary repairs, and obtained a freſh ſtock of proviſions, they prepared for leaving the iſland. The principal iſlands, about which the Engliſh had now ſpent ſomewhat more than three weeks, were ſix in number; viz. *Ulietea*, *Otaha*, *Bolabola*, *Huaheine*, *Tubai*, and *Maurua*; which ſee reſpectively. Our voyagers purſued their courſe till the 13th; when land was diſcovered bearing S.E., and which Tupia informed them was an iſland called *Oheteroa*. As the inhabitants manifeſted a hoſtile diſpoſition, lieutenant Cook, with equal wiſdom and humanity, made no attempt for landing. By Tupia our navigators were informed, that various iſlands lay at different diſtances, and in different directions from Oheteroa, between the ſouth and the north-weſt; and that to the north-eaſt there was an iſland called Manua, or Bird iſland. He alſo deſcribed ſeveral iſlands towards the weſt; probably Boſcawen and Keppel's iſlands, which had been diſcovered by Captain Wallis. The fartheſt iſland towards the ſouth, of which Tupia had any knowledge, was called *Moutou*, about three days ſail from Oheteroa. But his father, he ſaid, had informed him, that there were other iſlands farther to the ſouth. Lieutenant Cook determined, all circumſtances duly conſidered, to ſtand ſouthward in ſearch of a continent. On the 15th of Auguſt, our voyagers ſailed from Oheteroa, and on the 30th, in lat. 38° 20'. W. long. 147° 6', they obſerved a comet, the tail of which ſubtended an angle of 42 degrees. On the 6th of October they diſcovered an extenſive tract of land, which they at firſt conceived to be the "Terra Auſtralis incognita," but which proved, in the event, to be a part of New Zealand. Lieutenant Cook, having anchored, on the 8th, in a bay, at the entrance of a ſmall river, went on ſhore, accompanied by Mr. Banks and Dr. Solander, and attended with a party of men, in order to have ſome intercourſe with the natives. They aſſumed a very hoſtile appearance; and made attempts for running away with the pinnace, which had been left at the entrance of the river. On the next day they exhibited the ſame formidable aſpect, brandiſhing their pikes and lances. Tupia addreſſed them in a language, which was a dialect of their own and which they underſtood; informing them that our voyagers only wanted proviſions and water, in exchange for iron, the properties of which he explained as far as he was able. Their intentions, however, appeared to be unfriendly; and on the iron and beads, which were preſented to them, they ſeemed to ſet little value. Tupia told them at length, that if they proceeded to any farther violence, ſome of them muſt fall victims to the juſt retaliation of the Engliſh. This ſalutary counſel, however, produced no effect; and ſome were killed, and ſeveral wounded in the conflict that enſued. The ſeverity exerciſed on this occaſion, was very different from the conduct which Mr. Cook's prudence and humanity ſuggeſted in other caſes; and, on a calm review, it was not approved by himſelf; but he pleaded the nature of the ſervice in which he was employed and the neceſſity of obtaining a knowledge of the country, which he had previouſly attempted to acquire by kind treatment, and with a view to which he was at length obliged to recur to hoſtile and fatal meaſures. The lieutenant finding all his efforts to eſtabliſh an intercourſe with the natives unavailing, determined to re-embark, and on the 11th of the month he left this inhoſpitable place, which, as it had ſupplied him with no article except wood, he denominated *Poverty-bay*, called by the natives *Taoneróa*, or Long Sand, and ſituated in S. lat. 38° 42′, and W. long. 181° 36′. In this courſe he ſpent nearly ſix months, and made large additions to the knowledge of geography and navigation. By making the whole circuit of New Zealand, he aſcertained it to conſiſt of two iſlands. While the ſhip was hauling to the ſouth end of a ſmall iſland, called *Teahowary* by the natives, and by the lieutenant "Portland iſland," it ſuddenly fell into ſhoal water and broken ground. The inhabitants, perceiving its diſtreſs, put off in five canoes, and aſſumed a very formidable and menacing aſpect, and ſeemed to be prepared for action; and it was to little purpoſe that guns were fired in order to intimidate them. Whilſt ſome kind of traffic was carrying on with one of the canoes, Tupia's boy, who was ſtanding on the ſide of the ſhip, was ſeized by one of the New Zealanders, and carried off. Upon this atrocious act the marines were ordered to fire; and during the confuſion that enſued, the boy made his eſcape and ſwam to the ſhip; though he was purſued by the largeſt of the canoes. To the cape where this unhappy tranſaction occurred, Mr. Cook gave the name of "Cape Kidnappers;" it lies in S. lat. 39° 43′. W. long. 182° 24′. Between this cape and the iſland Portland is a bay, which, in honour of ſir Edward Hawke, the lieutenant called "Hawke's bay." While, on the 18th, the Endeavour lay a-breaſt of a peninſula within Portland iſland, called *Terakako*, two of the natives, ſuppoſed to be their chiefs, confided ſo far in Mr. Cook, as to venture on board the ſhip, and remained there all night, their canoe being hoiſted into the ſhip. On the 23d, while the ſhip was in *Tegadoo* bay, lieutenant Cook went on ſhore to examine the watering places, and found the water excellent and conveniently ſituated, and the diſpoſition of the people much more favourable than he expected. This lay in S. lat. 38° 22′ 24″, and W. long. 180° 47′. Here they ſupplied themſelves with as much wood and water as they wanted. On the 28th, ſome gentlemen of the Endeavour went on ſhore on an iſland which lies to the left hand of the entrance of Tolaga bay; and there ſaw the largeſt canoe which they had yet obſerved; her length being 68½ feet, her breadth 5 feet, and her height 3 feet 6 inches. While the ſhip was in Hicks's bay, the inhabitants of the adjoining coaſt were found to be very hoſtile. Early on the 1ſt of November, they counted 45 canoes coming from the ſhore towards the Endeavour, and ſeveral others following them from another place. Some of the Indians traded fairly; others added deriſion and inſolence to fraud; and though ſeveral ſmall ſhot were fired at them, the canoes merely dropped a-ſtern, and ſet up their ſong of defiance as they departed from the ſhip. In ſtanding weſtward from a ſmall iſland called *Mowtohora*, the Endeavour encountered ſome danger amidſt the adjacent rocks, but at length it eſcaped without injury near an iſland called by the lieutenant the *Mayor;* the inhabitants of the neighbouring coaſt diſplayed in many inſtances their hoſtility, and, in their traffic with our navigators, committed various acts of fraud and robbery. Here, *viz.* in S. lat. 36° 48′ 5½″, lieutenant Cook and Mr. Green made an obſervation of the tranſit of Mercury. In the mean while the ſhip was viſited by two large canoes, one of which indicated hoſtile intentions on the part of its crew. In the courſe of their traffic, they were guilty of an act of fraud, accompanied with menaces and defiance, which induced Mr. Gore to fire at the offender and to kill him. At length, however, in conſequence of ſmall ſhot fired over their heads, they all fled with the utmoſt precipitation. On the 10th, our commander, accompanied by Mr. Banks, and the other gentlemen, examined a large river that empties itſelf into the head of Mercury bay, and found the ſituation abounding with conveniences, capable of an eaſy defence, and furniſhing beds of excellent oyſters; this river Mr. Cook called Oyſter river. On the 15th he ſailed out of "Mercury bay," ſo called in conſequence of the obſerved tranſit of Mercury over the ſun, and lying in S. lat. 36° 47′. W. long. 184° 4′. Another river lies at the head of the bay, which is the beſt or ſafeſt place for a ſhip that wants to ſtay for any length of time. This the lieutenant, obſerving a number of Mangroves about it, called "Mangrove river." Before the Endeavour left the bay, Mr. Cook, having diſplayed the Engliſh colours, took formal poſſeſſion of the place in the name of his Britannic majeſty, king George III. In the range from Mercury bay ſeveral canoes appeared apparently for hoſtile purpoſes; but their occupiers were inſtantly diſperſed by a muſket ball, fired through one of their boats; although Tupia's oratory had proved ineffectual. While Mr. Cook remained in the "Bay of iſlands," he took occaſion to examine the interior part of the country and its produce. Some circumſtances occurred which produced diſagreement between the navigators and the inhabitants, and it required ſingular exertions of prudence, as well as of humanity on the part of Mr. Cook, to bring them to a termination. The number of inhabitants in the Bay of iſlands was found to be much greater than in any other part of New Zealand which the commander had hitherto viſited; and though they did not appear to be united under one head, and though their towns were fortified, they ſeemed to live together in perfect amity. The Endeavour on the 9th of December, lying becalmed in "Doubtleſs bay," an opportunity offered for making inquiries among the natives concerning their country; and Tupia enabled the lieutenant to learn, that at ſome diſtance, at a place called "Moore-whennua," the land would take a ſhort turn to the ſouthward, and thence extend no more to the weſt. This place the Engliſh gentlemen concluded to be the land diſcovered by Taſman, and which he had named "Cape Maria Van Diemen." The inhabitants, who ſeemed to be intelligent, farther informed them, that there was a country of great extent, to the N.W. by N. or N.N.W., called *Ulimaroa,* where it was underſtood that the people eat hogs. Our navigators, on the 30th of December, ſaw the land, which they judged to be "Cape Maria Van Diemen," and which correſponded with the account given of it by the Indians. The next day, they had demonſtrative evidence, from the appearance of mount Carmel, that, where they now were, the breadth of New Zealand could not be more than two or three miles from ſea to ſea. During this part of the navigation, they encountered, in S. lat. 35°, and in the midſt of ſummer, a long-continued and violent gale of wind; but as they were at a conſiderable diſtance from the land, they eſcaped the danger that alarmed them. The ſhore at "Queen Charlotte's Sound," where the Engliſh had arrived on the 14th of January, 1770, ſeemed to form ſeveral bays, into one of which lieutenant Cook propoſed to take the ſhip for neceſſary repairs, and for obtaining a recruit of wood and water, of which they were ſupplied with great plenty. On landing they found an Indian family, in which they found horrid and indiſputable proofs of the cuſtom of eating human fleſh. Evidences of the ſame cuſtom appeared likewiſe on ſeveral other occaſions. Whilſt they were near this part of the country, they were entertained with the moſt enchanting melody of birds, who began their ſong about two hours after midnight and continued it till ſun-riſe; thus reſembling the nightingales of our own country. Lieutenant Cook, upon aſcending one of the hills of the country, had a view of the ſea on the eaſtern ſide of it, and of a paſſage leading from it to that of the weſt, a little eaſt of the inlet where the ſhip lay. The main land, S.E. of this inlet, appeared to be a narrow ridge of very high hills, forming part of the S.W. ſide of the ſtrait. On the oppoſite ſide, the land trended away E. as far as the eye could reach; and to the S.E. was diſcovered an opening to the ſea, which waſhed the eaſtern coaſt. The lieutenant ſaw, alſo, on the E. ſide of the inlet, ſome iſlands which he had before taken to be part of the main land. In returning to the ſhip, he examined the harbour and coves that lie behind the iſlands which he had ſeen from the hills; and he employed the next day in farther ſurveys and diſcoveries:—the gentlemen of the ſhip alſo accompanied him in viſiting a town, which was built upon a ſmall iſland or rock, very difficult of acceſs, and which conſiſted of between 80 and 100 houſes; the inhabitants of which were very friendly and attentive, and furniſhed them with a large quantity of dried fiſh. From a hill of conſiderable height, which afforded a view of the coaſt to the N.W., the fartheſt land that appeared was an iſland at the diſtance of about 10 leagues, lying not far from the main; between this iſland and the place where the commander ſtood, he diſcovered, cloſe under the ſhore, ſeveral other iſlands, forming many bays, in which there appeared to be good anchorage for ſhipping. On the 30th of January the inlet where our voyagers now lay was named "Queen Charlotte's Sound," and a memorial was erected of their viſit to this place. At the ſame time Mr. Cook took formal poſſeſſion of this and the adjacent country in the name of king George III.; thus precluding the claims of future navigators, but reſerving to the original inhabitants their natural rights. On Monday, the 5th of February, the Endeavour, after encountering a violent ſtorm, got under ſail; but was ſoon obliged to come to an anchor a little above Motuara. Upon inquiring he learnt that there was a diſtant country, towards the north, called *Ulimaroa*; but he could obtain no farther particulars. Lieutenant Cook, on the 6th of February, got out of the Sound, and in the evening ſaw two ſmall iſlands, lying off "Cape Koamaroo," at the S.E. head of Queen Charlotte's Sound, and bearing E. at the diſtance of about four miles. The rapidity of the ſtream, occaſioned by the tide of ebb, endangered the ſhip, and it was reſcued by ſome favourable incidents; the narroweſt part of the ſtrait through which it was rapidly driven, lies between "Cape Tieravite," on the coaſt of the iſland of *Eaheinomauwe*, and "Cape Koamaroo;" the diſtance between them being eſtimated at four or five leagues. During Mr. Cook's long and minute examination of the coaſt of New Zealand, he gave names to the bays, capes, promontories, iſlands, and rivers, and other places which he ſaw or viſited; excepting in inſtances where their original appellations were learned from the natives. After having aſcertained New Zealand to be an iſland, Mr. Cook wiſhed to extend his acquaintance with the country. He completed his circumnavigation, by ranging from "Cape Turnagain," ſouthward along the eaſtern coaſt of *Poenammoo*, round "Cape South," and back to the weſtern entrance of the ſtrait which he had paſſed, and which has been very properly called Cook's *Strait*; which ſee. In this range an iſland, lying about five leagues from the coaſt of *Tovy-Poenammoo*, was diſcovered, and it was named "Banks's iſland." Lieutenant Cook, purſuing his courſe to the ſouthward, wiſhed to aſcertain, whether Poenammoo was an iſland or a continent. In the proſecution of this object he paſſed ſome dangerous rocks on the 9th of March, and on the ſame day reached a point of land called "South Cape," in S. lat. 47° 19'. W. long. 192° 12', which proved to be the ſouthern extremity of the country. On the 14th the Endeavour paſſed a ſmall narrow opening in the land, where was a ſafe and convenient harbour, formed by an iſland, which lay eaſtward in the middle of the opening. On the land behind this opening are mountains, the ſummits of which were covered with ſnow, that had recently fallen. The land on each ſide of the entrance of the opening, riſes almoſt perpendicularly from the ſea to a ſtupendous height: and, on this account lieutenant Cook did not chuſe to take the ſhip into the harbour. Before the 27th of March, the commander had circumnavigated the whole country of Tovy-Poenammoo, and arrived within ſight of the iſland before mentioned, lying nine leagues from the entrance into Queen Charlotte's Sound. With a view of obtaining a ſupply of water, he hauled round the iſland, and entered a bay, ſituated between that and Queen Charlotte's Sound, to which was given the name of *Admiralty-bay*; which ſee. Lieutenant Cook now directed his views towards Europe; and it was determined to return by the Eaſt Indies. In purſuance of this reſolution, it was propoſed that they ſhould ſteer eaſtward till they ſhould fall in with the eaſt coaſt of New Holland, and then follow the direction of that coaſt towards the north, till they ſhould arrive at its northern extremity. If that ſhould be found impracticable, it was farther reſolved that they ſhould endeavour to fall in with the land, or iſlands, ſaid to have been diſcovered by Quiros. For a farther account of *New* ZEALAND; ſee that article.

On the 31ſt of March our commander ſailed from "Cape Farewell" in New Zealand, S. lat. 40° 53'. W. long. 18°, and purſued his voyage towards the weſt. On the 19th of April "New Holland," or as it is now called, "New South Wales," came in ſight; and on the 28th, the ſhip anchored in *Botany-bay*; which ſee. During Mr. Cook's ſtay at this place, he cauſed the Engliſh colours to be diſplayed every day on ſhore, and took care that the ſhip's name, and the date of the year, ſhould be inſcribed on one of the trees near the watering-place. On the 6th of May our navigators ſailed from this bay; and in their farther progreſs lieutenant Cook gave the names marked upon the map to the bays, capes, points, and remarkable hills that appeared ſucceſſively in ſight. On the 14th, as the Endeavour advanced to the northward, being then in S. lat. 30° 22'. W. long. 206° 39', the land gradually roſe in height, ſo that it may be called a hilly country. Between this latitude and Botany-bay, it exhibits a pleaſing variety of ridges, hills, valleys, and plains, clothed with wood. On the 17th our navigators were in a bay called "Moreton's bay," S. lat. 26° 56′. W. long. 206° 28′; and from appearances they concluded that this bay opened into a river; but they had not then leiſure to aſcertain the fact. On the 22d, as they were purſuing their voyage from "Harvey's bay," they diſcovered that the land was covered with palm nut-trees, which they had not ſeen from the time of their leaving the iſlands within the tropic. Early in the next day they went on ſhore, in order to examine the country, and found a channel leading into a large lagoon. Here they diſcovered a ſmall river of freſh water, and room for a few ſhips to lie in great ſecurity. Near the lagoon grows the true Mangrove, ſuch as exiſts in the Weſt India iſlands, and the firſt of the kind that had been met with by our navigators. Among the iſlands and ſhoals they ſaw many large birds, which they judged to be pelicans, and on the ſhore a ſpecies of buſtard of a conſiderable ſize and excellent food; ſo that in honour of it they called the inlet *Buſtard-bay*. S. lat. 24° 4′. W. long. 208° 18′. Here they found a number of ſmall pearl-oyſters, among others of various kinds; ſo that Mr. Cook was of opinion, that an advantageous pearl-fiſhery might be eſtabliſhed in this place. On the 25th our voyagers, at the diſtance of one mile from the land, were a-breaſt of the point which Mr. Cook found to lie directly under the tropic of Capricorn, in W. long. 208° 58′, and he therefore called it "Cape Capricorn." On the 26th the ſhip, being under ſail, was ſurrounded with iſlands, which lay at different diſtances from the main land; and here Mr. Banks, in fiſhing, took two ſorts of crabs, ſuch as had not been ſeen before; one of them was adorned with a moſt beautiful blue, equal to the ultramarine, which tinged all his claws and joints, while the under part was white and highly poliſhed; the other was marked with ultramarine, more ſparingly, on his joints and toes, and on his back were three brown ſpots of a ſingular appearance. Lieutenant Cook finding a paſſage between the iſlands, ſailed to the northward, and anchored at about two miles diſtance from the main. A great number of iſlands were within ſight. Here Mr. Cook obſerving that the tide ebbed and flowed conſiderably, when the ſhip had anchored within the inlet, concluded that it was a river that might run pretty far up into the land. Our voyagers having gratified their curioſity with a variety of objects, but being diſappointed in their wiſhes of obtaining freſh water, determined to make a ſhort ſtay in this place. Before they left it, however, they were deſirous of more particularly examining the inlet, in which the ſhip lay; its breadth was found to be from two to five miles, upon a direction S. W. by S.; but here it opened every way, and formed a large lake, which to the N.W. communicated with the ſea. On the ſouth ſide of the lake was a ridge of hills; and various appearances indicated that the country was inhabited. The country, in general, in this part of New South Wales, appeared ſandy and barren, and deſtitute of the accommodations which would fit it for being poſſeſſed by ſettled inhabitants. This inlet, from its want of freſh water, was called by Mr. Cook "Thirſty Sound." S. lat. 22° 20′. W. long. 210° 18′. On the 31ſt our voyagers left the place and proceeded, till on the 7th of June they perceived on one of the iſlands, which they were paſſing, the appearance of cocoa-nut trees; but upon examination, theſe were miſtaken for a ſmall kind of cabbage-palm. On the 8th, when the Endeavour was in the midſt of a cluſter of ſmall iſlands, our navigators diſcerned, with their glaſſes, upon one of the neareſt of them, about 30 of the natives, men, women, and children, ſtanding together and attentively looking at the ſhip. This was the firſt inſtance of curioſity that had been obſerved among the people of the country. They were wholly naked; their hair was ſhort, and their complexion reſembled that of the other inhabitants that had been before obſerved. In navigating the coaſt of New South Wales, for an extent of 22 degrees of latitude, or more than 1300 miles, lieutenant Cook had conducted his veſſel in ſafety; but on the 10th of June, as he was purſuing his courſe from a bay, which he had called "Trinity bay," the Endeavour fell into a ſituation peculiarly critical and dangerous; having been lifted over a ledge of rock, and lying in a hollow within it. Her ſheathing boards were obſerved by the light of the moon to be floating away from her, and at laſt her falſe keel, ſo that every moment it was expected the whole company would be ſwallowed up by the ruſhing in of the ſea. The ſhip was expeditiouſly lightened as much as poſſible, and every exertion was made without murmur and with the greateſt alacrity to eſcape the imminent peril to which their lives were expoſed. So ſenſible were the ſailors of the awfulneſs of their ſituation, that not an oath was heard among them. When morning dawned upon them they had a clearer view of their danger. Providentially, however, it became a dead calm, and high water came on at eleven in the morning: but it was neceſſary ſtill further to lighten the ſhip, and two pumps were inſtantly worked to diſcharge the water that ruſhed in. For the tide at midnight they waited with anxious and awful expectation: in the mean while the leak increaſed to a very alarming degree; and though the ſhip righted, it was expected that ſhe muſt go to the bottom as ſoon as ſhe ceaſed to be ſupported by the rock. The floating of the ſhip, which in other circumſtances, would have been the means of their ſalvation, was in their ſituation, a ground of ſerious alarm; becauſe it might precipitate their deſtruction. Their poſſibility of eſcape was precarious, if the ſhip ſunk; and the coaſt on which they were to be thrown, if any of them eſcaped, was inhabited by naked ſavages, from whoſe compaſſion they might derive no relief. The deciſive moment at length arrived; and the ſhip was heaved into deep water, without admitting more water than when ſhe lay upon the rock. The men had experienced long anxiety and were ſinking with fatigue; and in an exhauſted ſtate they threw themſelves upon the deck, and after ſhort intervals and pauſes of reſt, renewed their laborious and almoſt fruitleſs exertion; for the leak gained upon the pumps. In this ſtate of anxiety and labour, an accident occurred, which had almoſt terminated, at once, all their efforts. The planking which lines the ſhip's bottom is called the cieling; between which and the outſide planking there is a ſpace of about eighteen inches. From this cieling only, the man who had attended the well had taken the depth of the water, and had given the meaſure accordingly. But the perſon, who relieved him, meaſured the depth to the outſide planking, which had the appearance of the leak's having gained upon the pumps eighteen inches in a few minutes. The miſtake, however, was ſoon detected; and this accident, at firſt ſo alarming, became, in the event, highly advantageous. New hopes, from a diſcovery that their ſituation was not ſo dangerous as they apprehended, inſpired new vigour; and before eight in the morning the pumps gained conſiderably on the leak. At eleven o'clock the Endeavour was once more under ſail, and ſtood for the land. They wiſhed, however, to ſtop the leak; and Mr. Monkhouſe, one of the midſhipmen, propoſed to the commander an expedient which had preſerved a merchant ſhip, which had ſprung a leak that admitted more than four feet water in an hour. This was called *fothering* the ſhip. (See Fothering.)

The expedient ſucceeded; and it was owing partly to a fragment of rock, which had filled up one of the holes of the ſhip, that ſhe did not ſink and involve her whole company in inevitable deſtruction. In conſequence of the diſtreſs experienced by the whole crew on this occaſion, lieutenant Cook called a point in ſight, which lay to the northward, in S. lat. 16° 6′. W. long. 214° 39′, "Cape Tribulation." On the 14th a ſmall harbour was diſcovered, excellently adapted for repairing the damage which the ſhip had ſuſtained. Another alarming circumſtance, which occurred at this time, was the acceſs of the ſcurvy, that began to make its appearance among the ſhip's company, and that rendered it ſtill more neceſſary to get on ſhore. On the 17th the ſhip put in for the harbour, the entrance of which was a narrow channel. Tents were erected for the accommodation of the ſick; and all of them, except Mr. Green, manifeſted ſymptoms of recovery. On the 29th of June an emerſion of Jupiter's firſt ſatellite was obſerved, from which they obtained the longitude of the place 214° 42′ 30″ W., its latitude being 15° 26′ S. A plan of the harbour was taken; and Mr. Cook aſcended a hill, from which he obſerved, to his great concern, innumerable ſandbanks and ſhoals, lying in every direction of the coaſt. To the northward there was the appearance of a paſſage, by which lieutenant Cook had the only chance of getting clear, in the proſecution of his voyage. By a large ſupply of fiſh, he was able to diſtribute 2½ pounds to each man; a quantity of greens, being procured, were boiled with the peas: and by theſe means the ſhip's company obtained a very conſiderable refreſhment. On the 2d of July our lieutenant ſent the maſter out of the harbour, to ſound about the ſhores, and to ſearch for a paſſage to the northward. In a ſubſequent inveſtigation, a paſſage to the ſea was diſcovered between the ſhoals, which conſiſted of coral rocks, and which had furniſhed cockles of an enormous ſize, inſomuch that one of them was more than ſufficient for two men. Other ſhell-fiſh were alſo found in great abundance. At high water the ſhip floated; but a leak having been diſcovered, it was neceſſary to lay her aſhore a ſecond time. The ſeveral damages being repaired, the ſhip was again floated at high water, and preparations were made for proceeding on the voyage. To this harbour Mr. Cook gave the name of "Endeavour river." The maſter, having been diſpatched to re-examine the paſſage, which he had before diſcovered, reported that he had been miſtaken. In the mean while, the inhabitants of the country, who had been very reſerved in holding any intercourſe with the navigators, became more familiar, in conſequence of the commander's prudent management. Here they diſcovered an animal, called by the natives *kanguroo*, which, being dreſſed, proved to be excellent meat; and they were alſo furniſhed with great plenty of turtle, ſuperior to any which the gentlemen ever taſted in England. The turtle was of the ſpecies called green turtle, and they weighed from two to three hundred pounds. The inland country was agreeably diverſified by hills, valleys, and large plains, which in many places were richly covered with wood. The longitude of their ſtation, determined by an obſervation of the emerſion of Jupiter's firſt ſatellite, July the 16th, was 214° 53′ 45″; that on the 29th of June had given 214° 48′ 30″, the mean of which was 214° 48′ 7½″ W. The Indians were very hoſtile and fraudulent; and ſo daring and inſolent, that nothing would diſperſe them but ſmall ſhot repeatedly fired from the muſkets. In order to incommode our navigators, they ſet fire to the graſs, which blazed in various directions. On the 4th of Auguſt, after frequent unſucceſsful attempts to diſengage the ſhip from the harbour, ſhe got under ſail; but many difficulties occurred; and on the 5th, the lieutenant had not kept his courſe long before ſhoals were diſcovered in every quarter, which obliged him, at the approach of night, to come to an anchor. On the morning of the 10th, the weather, which had been boiſterous, became more moderate, and the commander weighed anchor, and ſtood in for the land; determining to ſeek a paſſage along the ſhore to the northward. In purſuance of this reſolution, the Endeavour proceeded in her courſe, and at noon came between the farthermoſt head-land that lay in ſight, and three iſlands which were four or five leagues to the north of it, out at ſea. Here they thought there was a clear opening before them, and began to hope that they were once more out of danger. In this hope, however, they were ſoon diſappointed, and therefore the lieutenant gave to the head-land, in S. lat. 14° 56′. W. long. 214° 43′, the name of "Cape Flattery." After ſteering for ſome time along the ſhore, for what was believed to be the open channel, an officer at the maſt-head cried aloud that he ſaw land a-head, which extended quite round to the three iſlands; and that between the ſhip and them there was a large reef. Mr. Cook himſelf diſcerned the reef, but was of opinion that the ſuppoſed land was a cluſter of ſmall iſlands. In this ſtate of uncertainty, however, he thought it moſt prudent to come to anchor, under a high point, from which he could have an extenſive view of the ſea and country. This eminence he called "Point Look-out." In the proceſs of inveſtigating the ſhoals and channel between them, the lieutenant, accompanied by Mr. Banks, diſcovered an iſland on which were no animals except lizards; and he therefore called it "Lizard iſland." In their return to the ſhip, they landed on a low ſandy iſland, abounding with an incredible number of birds; and as they here found the neſt of an eagle, they called it "Eagle iſland." At length, after much deliberation, it was reſolved to quit the coaſt entirely, till they could approach it with leſs danger; and in purſuance of this reſolution, the Endeavour, on the 13th, got under ſail, and ſucceſsfully paſſed through one of the channels or openings in the outer reef, which Mr. Cook had previouſly obſerved. The ſituation of our navigators was now happily changed; and after three months' anxiety and ſuſpence, they found themſelves in an open ſea, with deep water. The paſſage or channel, through which the Endeavour paſſed into the open ſea beyond the reef, lies in S. lat. 14° 32′. It is diſtinguiſhed by the three high iſlands within it, to which, on account of the uſe they may be of in guiding the way of future voyagers, our commander gave the appellation of "Iſlands of Direction." New dangers, which created alarm and required freſh exertions, occurred; but every man did his duty with as much calmneſs and regularity as if no danger had been near. It was indeed the high and magnanimous ſpirit of the commander, which inſpired his people with ſuch reſolution and vigour. On the coaſt of a new and unknown country he braved all perils, and determined to aſcertain whether this country did, or did not, join to New Guinea: a queſtion which he had fixed upon reſolving, from the firſt moment that he had come within ſight of land. To the opening, through which he had paſſed with ſo much hazard, the commander, under a proper ſenſe of gratitude to the Supreme Being, gave the name of "Providential channel." In the proſecution of the voyage, the navigators, on the 19th, were encompaſſed on every ſide with rocks and ſhoals; but they were little moved, as perils had been familiar to them. On the 21ſt, as no land could be ſeen, they conceived hopes of having at laſt found a paſſage into the Indian ſea; but to determine this matter with greater certainty, lieutenant Cook reſolved to land upon an iſland, which lies in the S.E. point of the paſſage. Accordingly he, accompanied by Mr. Banks and Dr. Solander, aſcended a high hill, from which no land could be ſeen between the S.W. and W.S.W.; ſo that Mr. Cook had not the leaſt doubt of finding a channel, through which he might paſs to New Guinea. As he was now about to quit the coaſt of New Holland, which he had traced from lat. 38° to this place, and where he was certain no European had ever been before, he once more hoiſted Engliſh colours, taking poſſeſſion of the whole eaſtern coaſt, with all the bays, harbours, rivers, and iſlands ſituated upon it, from lat. 38° to lat. 10½° S. in right of his majeſty king George III., and by the name of *New South Wales*. Having performed this ceremony upon the iſland, hence called "Poſſeſſion iſland," they reimbarked in their boat; and on the 23d Mr. Cook was confirmed by ſeveral circumſtances in his opinion, that he had arrived to the northern extremity of New Holland, and that to the weſtward he had an open ſea. Theſe circumſtances afforded him peculiar ſatisfaction, not only becauſe the dangers and fatigues of the voyage were drawing to a concluſion, but becauſe it could no longer be doubted whether New Holland or New Guinea were two ſeparate iſlands. The N.E. entrance of the third lies in S. lat. 10° 39′. W. long. 218° 36′; and the paſſage is formed by the main land, and by a congeries of iſlands to the N.W., called by Mr. Cook the "Prince of Wales's iſlands," and which may probably extend as far as to New Guinea. To the channel through which he paſſed, he gave the name of "Endeavour ſtraits."

From the coaſt of New South Wales, the lieutenant ſteered, on the 23d of Auguſt, for the coaſt of New Guinea; but in the proſecution of his voyage he fell upon a dangerous ſhoal, which expoſed him to great danger; but he fortunately eſcaped; and on the 3d of September arrived within ſight of New Guinea, and brought to within three or four miles of land. Some of the ſhip's company went on ſhore, but they were ſuddenly attacked by the natives, who had for ſome time concealed themſelves in the woods. See New Guinea. Our voyagers leaving this coaſt, haſtened to the weſtward; and purſuing their courſe, they diſcovered on the 6th of September a ſmall iſland N.N.W.; and another low iſland, extending from that quarter to N.N.E. Unleſs theſe two iſlands belong to the "Arrou iſlands," they have no place in the charts; and if they do belong to theſe, they are laid down at too great a diſtance from New Guinea. Mr. Cook found the E. part of them in S. lat. 7° 6′. W. long. 225°. On the 7th, when the ſhip was in S. lat. 9° 30′, and W. long. 229° 34′, our navigators ought to have been in the ſight of the Weaſel iſles, which are laid down in the charts at the diſtance of 20 or 25 leagues from the coaſt of New Holland; but Mr. Cook, as he did not ſee them, concluded that they muſt have been laid down erroneouſly. In purſuing their courſe, our navigators paſſed the iſlands of Timor, Timor-lavet, Rotle, and Seman. When they were near theſe two latter iſlands they obſerved a phenomenon in the heavens, in ſome reſpects reſembling, but in others differing from, the Aurora Borealis. Having paſſed all the iſlands between Timor and Java, lieutenant Cook did not expect to meet with any other in that quarter; but on the 17th he obſerved an iſland bearing W.S.W., which he thought to be a new diſcovery. When they came to the N. ſide of it, they ſaw houſes and cocoa-nut trees, and numerous flocks of ſheep. Here they landed; the commander thinking he might thus ſupply the neceſſities of the ſhip's company, and remove both the ſickneſs and the diſcontent which had ſpread among them. This proved to be the iſland of Savu; which ſee. On the 21ſt of September our navigators left Savu, and on the 1ſt of October came within ſight of the iſland of Java; and on the 9th they ſtood in for Batavia road, where the Endeavour was ſecured from a ſtroke of lightning by the chain that was attached to it. The injurious effects of this climate were felt by our voyagers within nine days after their arrival; and Mr. Monkhouſe, the ſurgeon of the ſhip, fell, on the 5th of November, the firſt ſacrifice to this fatal country. Tayeto, Tupia's boy, died the 9th, and Tupia ſurvived him only a few days. The repair of the Endeavour, which had been very much damaged, and which appeared to be in a very alarming ſtate, was an object to which Mr. Cook, though himſelf affected by the climate, directed his particular attention, and it was performed much to his ſatisfaction. When this buſineſs was accompliſhed, on the 27th of December, the ſhip ſtood out to ſea; and on the 5th of January 1771, came to an anchor under the S.E. ſide of "Prince's iſland," where the gentlemen of the ſhip, after having paid their reſpects to the king, commenced a traffic with the natives for turtles, fowls, fiſh, monkies, ſmall deer, and vegetables. On the 15th the commander weighed, and ſtood out for ſea. In the proſecution of the voyage to the Cape of Good Hope, the ſeeds of diſeaſe, which had been received at Batavia, appeared with very threatening ſymptoms, and reduced the navigators to a very melancholy ſituation. The ſhip was a mere hoſpital; the water taken in at Prince's iſland was purified with lime; and in order farther to guard againſt infection, the commander ordered all the parts of the veſſel between the decks to be waſhed with vinegar. So fatal, notwithſtanding every precaution, was the diſeaſe, that almoſt every night a dead body was committed to the ſea. The loſs amounted in all to 23 perſons, beſides the ſeven who died at Batavia. Among theſe were Mr. Green the aſtronomer, Mr. Parkinſon, natural hiſtory painter, Mr. Monkhouſe the midſhipman, another midſhipman, &c. &c. Theſe calamitous events contributed moſt probably to turn the attention of Mr. Cook to thoſe methods of preſerving the health of ſeamen, which he afterwards purſued with ſuch remarkable ſucceſs. On the 15th of March the Endeavour arrived off the Cape of Good Hope; and a proper place was provided on ſhore for the accommodation and recovery of the ſick. Lieutenant Cook having ſtaid here whilſt the ſick of his crew were recovered, neceſſary ſtores were procured, and the veſſel refitted, till the 14th of April, ſtood out of the bay, and proceeded on his voyage homeward. In the morning of the 29th, he croſſed his firſt meridian, having circumnavigated the globe in the direction from eaſt to weſt; the conſequence of which was that he had loſt a day, an allowance for which had been made at Batavia. On the 1ſt of May he arrived at St. Helena, and on the 4th he departed from this iſland, and purſued his courſe in ſafety. On the 10th of June, land, which proved to be the Lizard, was diſcovered; on the 11th the ſhip ran up the channel; next morning he paſſed Beachy head; and in the afternoon of the ſame day anchored in the Downs, and went on ſhore at Deal. Thus ended Mr. Cook's firſt voyage round the world, in which he had gone through ſo many dangers, explored ſo many countries, and exhibited the ſtrongeſt proofs of his poſſeſſing an eminently ſagacious and active mind; a mind that was equal to every perilous enterpriſe, and to the boldeſt and moſt ſucceſsful efforts of navigation and diſcovery.

Mr. Cook having thus recommended himſelf to the protection of government, and the favour of his ſovereign, was promoted in the progreſſive order of the naval ſervice, to be a commander in his majeſty's navy, Aug. 29, 1771;

1771; an officer inferior in rank only, but equal in advantage to that of poſt-captain. On the 21ſt of May 1772, captain Cook communicated to the Royal Society by a letter to Dr. Maſkelyne, "An Account of the flowing of the Tides in the South Sea, &c." (ſee Phil. Tranſ. vol. lxii. p. 357-8.) The curioſity of the public was much excited by the reports of lieutenant Cook's voyage; and it was amply gratified by Dr. Hawkeſworth's Account, in 3 vols. 4to. Extenſive and intereſting was the knowledge obtained in conſequence of this voyage; but the queſtion concerning a ſouthern continent remained ſtill undecided. The reign of our preſent ſovereign George III. has been favourable to every kind of ſcientific and literary inquiry; and the earl of Sandwich, who, at the period to which we now refer, was at the head of the admiralty, was eminently capable of comprehending and diſpoſed alſo to encourage the moſt enlarged views and ſchemes with regard to navigation and diſcovery. By his particular recommendation, it was reſolved to appoint a commiſſion for determining the long diſputed queſtion relating to the exiſtence of a ſouthern continent. Quiros ſeems to have been the firſt perſon who ſuggeſted the idea of ſuch a continent; but though he was ſent out to aſcertain it, he failed in the attempt. Mr. Dalrymple had now excited the public attention to this object, by his Hiſtorical Collection, in 2 vols. 4to. of the ſeveral voyages and diſcoveries in the ſouth Pacific Ocean, 1770, 1771. When the Board of Admiralty determined to take up the buſineſs, captain Cook was immediately fixed upon as the perſon beſt qualified for conducting an enterpriſe which was to give the utmoſt poſſible extent to the geography of the globe, and the knowledge of navigation. Two ſhips, ſimilar in conſtruction to the Endeavour, were provided for this purpoſe; the largeſt of the two, which conſiſted of 462 tons burthen, was named the Reſolution; and to the other, conſiſting of 336 tons burthen, was given the name of the Adventure. On the 28th of November 1771, captain Cook was appointed to the command of the former; and, about the ſame time, Mr. Tobias Furneaux was promoted to the command of the latter. The complement of the Reſolution, in officers and men, was fixed at 112 perſons, and that of the Adventure at 81. In the equipment of theſe ſhips, attention was directed to every circumſtance that could contribute to the comfort and ſucceſs of the voyage. Lord Sandwich was ſingularly attentive on the occaſion; and both the navy and victualling boards took care to procure for the ſhips the beſt ſtores and proviſions, together with an ample ſupply of antiſcorbutic articles, ſuch as malt, ſour krout, ſalted cabbage, portable broth, ſoup, muſtard, marmalade of carrots, and inſpiſſated juice of wort and beer. Scientific objects were alſo duly regarded. Mr. William Hodges, an excellent landſcape painter, Mr. Reinhold Foſter, and his ſon, well informed in natural hiſtory, and Mr. William Wales, and Mr. William Bayley, ſkilful aſtronomers, were appointed to accompany the expedition; they were furniſhed with the beſt inſtruments for obſervation, and particularly with four time-pieces, three of Mr. Arnold's conſtruction, and one of Mr. Kendal's, upon the principles of Mr. Harriſon. Captain Cook, on board the Reſolution, joined the Adventure in Plymouth Sound, on the 3d of July 1772, and there received his inſtructions, which comprehended, without entering into a minute detail, the moſt enlarged plan of diſcovery that is known in the hiſtory of navigation. He was inſtructed not only to circumnavigate the whole globe, but to circumnavigate it in high ſouthern latitudes, making ſuch traverſes, from time to time, into every corner of the Pacific ocean not before examined, as might finally and effectually reſolve the much agitated queſtion about the exiſtence of a ſouthern continent, in any part of the ſouthern hemiſphere, to which acceſs could be had, by the efforts of the boldeſt and moſt ſkilful navigators.

On the 17th of July, captain Cook ſailed from Plymouth, and on the 29th anchored in Funchiale road, in the iſland of Madeira. Having ſupplied himſelf with water, wine, and other neceſſaries, he left the iſland Aug. 1ſt, and ſailed to the ſouthward. As he proceeded, he made three puncheons of beer of the inſpiſſated juice of malt, and the liquor was briſk and drinkable; though on account of the heat of the weather, and the agitation of the ſhip, the juice was in a high ſtate of fermentation. If it could be kept from fermenting, this would be a moſt valuable article at ſea. At St. Jago, one of the Cape de Verd iſlands, he ſtopped to procure a freſh ſupply of water. On the 20th of the month, they were delayed with rain; but to guard againſt the pernicious effects of rain on any future occaſion, captain Cook took care to well air and dry the ſhip with fires between the decks, and to ſmoak its damp places; beſides, the people were ordered to air their bedding, and to waſh and dry their cloaths, whenever they had an opportunity; ſuch was the reſult of theſe precautions, that there was not one ſick perſon on board the Reſolution. On the 8th of September, the ſhip croſſed the line in W. long. 8°, and proceeded on its voyage. On the 29th, being near the Cape of Good Hope, the whole ſea, as far as our voyagers could ſee, became at once, as it were, illuminated. In order to aſcertain the true cauſe of this phenomenon, which had in the former voyage been attributed to luminous inſects, captain Cook examined ſome buckets of water, and found in them a number of globular inſects, about the ſize of a common pin's head, and quite tranſparent. Mr. R. Forſter was ſatisfied that theſe were the cauſe of the ſea's illumination. On the 30th, the Reſolution and Adventure anchored in Table bay; and the captains on going a-ſhore, were received by the governor with great politeneſs. On the 22d of November, our commander ſailed from the Cape, and proſecuted his voyage in ſearch of a ſouthern continent. He directed his courſe for Cape Circumciſion; but, by tempeſtuous weather, our voyagers were driven far to the eaſtward of their intended courſe, being in S. lat. 48° 41′. E. long. 18° 24′, ſo that they had no hopes of reaching this Cape. In this gale, they had the misfortune to loſe the principal part of the live ſtock on board, conſiſting of ſheep, hogs, and geeſe.

On the 10th of December, in S. lat. 50° 40′, and long. 2° E. of the Cape of Good Hope, they began to meet with iſlands of ice, one of which was judged by captain Cook to be about 50 feet high, and half a mile in circuit. The weather was hazy, and danger was imminent. On the 18th they happily got clear of the field of ice. They were now in S. lat. 55° 8′, and long. 24° 3′. An opinion had been entertained, that ſuch ice was formed in bays and rivers; and hence our voyagers were led to conclude, that land was not far diſtant. But they proceeded without finding it. The whole crew began to complain much of cold, and therefore the captain directed the ſleeves of their jackets to be lengthened with baize, and ordered a cap to be made for each, ſtrengthened with canvas. This ſeaſon, it ſhould be recollected, was with them the middle of ſummer. As ſome of the crew appeared to have ſymptoms of the ſcurvy, freſh wort was given them every day. By the 29th, the commander was ſatisfied that the field of ice, along which the ſhips had ſailed, did not join to any land. Determining to run as far W. as the meridian of Cape Circumciſion, a gale ſprung up on the 31ſt, which brought with it ſuch a ſwell of ſea, as rendered a continuance among the ice perilous; our navigators, therefore, hauled to the ſouth. On the 1ſt of January 1773, the gale abated, and the people had a ſight of the moon, which they had obſerved but once, ſuch was the ſtate of the weather ſince they had left the Cape of Good Hope. They were now in S. lat. 58° 53′ 30″, and E. long. 9° 34′ 30″. In this ſituation, land, if it had exiſted, might have been at the diſtance of 14 or 15 leagues; but as it was not viſible, captain Cook concluded it to be very probable, that Bouvet had miſtaken mountains of ice for land. Upon the whole, there was reaſon to believe that no land was to be met with under this meridian, between the latitude of 55 and 59 degrees, as ſome had ſuppoſed. From the ice, however, captain Cook derived the advantage of procuring a ſupply of freſh water, which was ſweet, and well taſted. On the fields of ice, they obſerved penguins, albatroſſes, and other birds; but the prevalent opinion, that ſuch birds never go far from land, was now found to be erroneous. On the 17th of January captain Cook, having reached the latitude of 67° 15′ S., could advance no farther; and as the ice towards the ſouth exhibited no appearance of any opening, he thought it prudent not to perſevere in ſailing farther ſouthward, more eſpecially as the ſummer was already half ſpent, and there was no proſpect of being able to get round the ice. He, therefore, determined to ſearch for the land which had lately been diſcovered by the French, and ſeparated the ſhips at an interval of four miles, the weather being occaſionally clear, as the beſt method of inveſtigation. On the 1ſt of February our voyagers were in S. lat. 48° 30′, and E. long. 58° 7′, nearly in the meridian of the iſland of St. Mauritius. From the perpetual high ſea which had been lately met with, captain Cook inferred that there could be no great extent of land to the weſt. But whilſt he was ſteering eaſtward, in S. lat. 49° 13′, captain Furneaux ſuggeſted that the land was to the N.W. of them, as he had obſerved the ſea to be ſmooth when the wind blew in that direction. Captain Cook, in deference to this opinion, purſued the ſearch; and the reſult was a conviction, that, if any land was near, it could be only an iſland of inconſiderable extent. In this part of the ſouthern ocean the mean variation of the compaſs was 29° 4′ W. When the ſun was on the ſtarboard of the ſhip, the variation was the leaſt; and when on the larboard ſide, the greateſt. A ſeparation now took place between the two ſhips, and the Reſolution was under a neceſſity of purſuing its voyage alone. As they proceeded they were ſatisfied that the ſight of oceanic birds, which frequent high latitudes, are no ſure ſigns of the vicinity of land. In the morning of the 17th, lights were ſeen in the heavens, ſimilar to thoſe which are known in the northern hemiſphere under the appellation of Aurora Borealis. On the 20th our navigators thought they ſaw land to the ſouth-weſt; but they found, on endeavouring to approach it, that they had been deceived by clouds, and nothing could be diſcerned but ice iſlands. At night the Aurora Auſtralis was again ſeen, aſſuming a very brilliant and luminous appearance, diſcovering itſelf firſt in the eaſt, and ſoon ſpreading over the whole heavens. On the 23d, in S. lat. 61° 52′. E. long. 95° 2′, our navigators, in the midſt of mountains of ice, were on every ſide ſurrounded with danger; and hence captain Cook was led to alter his purpoſe of once more croſſing the Antarctic circle; and on the 24th he ſtood to the north, expoſed to the hazard of injury from large pieces of broken ice, in very thick and hazy weather. In ſailing from the 25th to the 28th captain Cook was convinced to a certainty, that no land, of any conſiderable extent, could lie within 100 or 150 leagues from eaſt to ſouth-weſt. As he proceeded on his voyage from the 28th of February to the 11th of March, he had ample reaſon for concluding, from the ſwell of the ſea and other circumſtances, that there could be no land to the ſouth, that did not lie at a great diſtance. By obſervation of the ſun and moon on the 13th and 14th they were in S. lat. 58° 22′. E. long. 136° 22′. Mr. Kendal's and Mr. Arnold's watches gave each of them 134° 42′; and this was the firſt and only time, in which they had pointed out the ſame longitude ſince the ſhips had left England: the greateſt difference, however, between them, ſince our navigators had left the Cape, had not much exceeded two degrees. Farther evidence occurred to our commander, as he advanced in his courſe, that he had left no land behind him, in the direction of W. S. W., and that no land lay to the S. on this ſide of 60 degrees of latitude. On the 17th he therefore determined to quit the high ſouthern latitudes, being now in S. lat. 59° 7′, and E. long. 146° 53′, and to proceed to New Zealand, in ſearch of the Adventure, and for the refreſhment of his people. He had alſo a deſire of viſiting the eaſt coaſt of Van Diemen's land, in order to gain ſatisfaction whether it joined the coaſt of New South Wales. But the wind preventing his accompliſhing this object; he ſhaped his courſe for New Zealand, and came to anchor on the 26th in "Duſky bay." He had now been 117 days at ſea, in which time he had ſailed 3660 leagues, without once coming within ſight of land. So ſalutary had been the effects of ſweet wort and ſeveral articles of proviſion, and eſpecially of the frequent airing and ſweetening of the ſhip, that there was only one man on board who could be ſaid to be afflicted with the ſcurvy; and his diſorder was occaſioned by a bad habit of body and a complication of other diſeaſes. On the 27th the ſhip entered "Pickerſgill Harbour," ſo called from the name of the gentleman by whom it had been firſt diſcovered, and ſituated in S. lat. 45° 47′ 26½″ S. and E. long. 166° 18′. Here wood for fuel and other purpoſes was immediately at hand: and a fine ſtream of freſh water was not above 100 yards from the ſtern of the veſſel. Having ſelected a ſuitable place on the ſhore for future operations, captain Cook employed ſome of the crew in the brewing of beer from the branches or leaves of a tree reſembling the American black ſpruce, which, with the addition of the inſpiſſated juice of wort and melaſſes, would make, as he knew, a very wholeſome liquor, and ſupply the want of vegetables of which the country was deſtitute. While captain Cook continued in this ſituation, he took every opportunity of examining the bay. See DUSKY *Bay*.

On the 11th of May, captain Cook left Duſky bay, and directed his courſe for Queen Charlotte's Sound, where he expected to find the Adventure; but on the 17th, the wind flattened to a calm, the ſky became ſuddenly obſcured by dark denſe clouds, and there was every prognoſtication of a tempeſt. Soon after ſix water ſpouts were ſeen, four of which roſe and ſpent themſelves between the ſhip and the land; but they all ſpent themſelves without doing any injury. On the next day the Reſolution came within ſight of Queen Charlotte's Sound, and there capt. Cook had the ſatisfaction of finding the Adventure; after a ſeparation of fourteen weeks, captain Furneaux had an opportunity of examining Van Diemen's land; and it was his opinion that there are no ſtraits between this land and New Holland, but a very deep bay. He met likewiſe, with farther proofs, that the New Zealanders are eaters of human fleſh. On the morning after captain Cook's arrival in Queen Charlotte's Sound, he went on ſhore and returned with a boat-load of ſcurvy-graſs, celery, and other vegetables; and he gave orders that they ſhould be boiled, with wheat and portable broth, every day for breakfaſt, and with peaſe and broth for dinner. Experience had taught him that theſe vegetables, thus dreſſed, are very beneficial to ſeamen, in removing various ſcorbutic complaints. The intercourſe with the natives of the country was of a friendly nature; and proved advantageous in a variety of reſpects, particularly in ſupplying a quantity of fiſh. On the 2d of June, when the ſhips were almoſt ready to put to ſea, captain Cook ſent on ſhore a male and female goat; and captain Furneaux left at Cannibal cove, two breeding ſows, and a boar. It is a remarkable circumſtance, that during captain Cook's ſecond viſit to Charlotte Sound, he could not recollect the face of any one perſon he had ſeen three years before, nor did it appear that a ſingle Indian had any knowledge of him. Hence he infers, that in the interval the natives had either been driven away, or had removed, of their own accord, to ſome other ſituation. Not one-third of the inhabitants, formerly obſerved, ſeemed to be now there; their ſtrong hold on the point of Motuara was deſerted, and in every part of the Sound many forſaken habitations were diſcovered.

In the captain's opinion, the place had never been very populous. From comparing the two voyages, it appears that the Indians of Eahei-nomauwe are in ſomewhat of a more improved ſtate of ſociety than thoſe of Tavai-poenammoo. During captain Cook's ſtay in the Sound, he had obſerved that the ſecond viſit to this country had not mended the morals of the natives of either ſex. He had always looked upon the females of New Zealand as more chaſte than the generality of Indian women. But he was now told, that the male Indians were the chief promoters of a ſhameful traffic, and that, for a ſpike-nail, or any other thing they valued, they would oblige the women to proſtitute themſelves, whether it was agreeable or contrary to their inclinations. At the ſame time, no regard was paid to the privacy which decency required. The account of this fact muſt be read with concern by every well-wiſher to the good order and happineſs of ſociety, even without adverting to conſiderations of a higher nature. On the 7th of June captain Cook put to ſea from Queen Charlotte's Sound together with the Adventure; and on the 1ſt of Auguſt, when they were in S. lat. 25° 1′, and W. long. 134° 6′, they were nearly in the ſituation aſſigned by captain Carteret for "Pitcairn's iſland," diſcovered by him in 1767; but they did not obſerve it. As our commander advanced in his courſe, every circumſtance concurred to convince him that between the meridian of America and New Zealand there is no ſouthern continent; and that there is no continent farther to the ſouth unleſs in a very high latitude. But the inveſtigation and deciſion of the fact were reſerved for the employment of the enſuing ſummer. It was the 6th of Auguſt before the ſhips had the advantage of the trade wind; which they got at S.E. in S. lat. 19° 36′. W. long. 131° 32′. Having obtained this wind, captain Cook directed his courſe to the W.N.W. and proceeded in the track purſued by M. de Bougainville. To four of the iſlands which he paſſed, he gave the names of "Reſolution iſland," "Doubtful iſland," "Furneaux iſland," and "Adventure iſland," which ſee reſpectively. Theſe are ſuppoſed to be the ſame that were ſeen by M. de Bougainville; and they, with ſeveral others, conſtitute a cluſter of low and half-drowned iſles, which that gentleman diſtinguiſhed by the name of the Dangerous Archipelago. On the 15th of Auguſt the ſhips came within ſight of "Oſnaburg iſland," or Maitea, which had been diſcovered by captain Wallis. Having eſcaped being wrecked on the coaſt of Otaheite, they anchored, on the 17th, in Oaitipiha bay, near the S.E. end of the iſland; and they were immediately crowded with the inhabitants of the country, who brought with them cocoa-nuts, plaintains, bananas, apples, yams, and other roots, which were exchanged for nails and beads. On the 24th the ſhips put to ſea, and arrived the next evening in Matavai-bay; but before they could come to anchor, the decks were crowded by the natives, many of whom were known to captain Cook or by moſt of whom he was well remembered. At Oparree the tents and aſtronomer's obſervatories remained, on the ſame ſpot from which the tranſit of Venus had been obſerved in 1769. As ſoon as the ſick were recovered, the water completed, and the neceſſary repairs of the ſhips finiſhed, captain Cook determined to put to ſea, and on the 1ſt of September he ordered the veſſels to be unmoored. In the mean while lieutenant Pickerſgill returned from Attahourou, where he had been to procure hogs; and in this expedition he had ſeen Oberea, in a very humble ſituation, compared with that which ſhe had formerly occupied. In the evening of this day a favourable wind having ſprung up, the commander put to ſea; on which occaſion he diſmiſſed his Otaheite friends ſooner than they wiſhed to depart; but well ſatisfied with his kind and liberal treatment. From Matavai captain Cook directed his courſe for the iſland Huaheine; this he reached the next day, and on the 3d of September anchored in the harbour of Owharre. Both the captains landed upon the iſland, and being cordially received by the natives, commenced a trade with them. Every thing was conducted with mutual confidence and harmony till the 6th, when ſeveral circumſtances occurred on the part of the natives, which interrupted the friendly intercourſe. Captain Cook at length complained to Oreo, the king, of their inſolence and frauds, who was much concerned on the occaſion; and exerted himſelf to obtain redreſs and to puniſh the delinquents. It was from the iſland Huaheine that captain Furneaux received into his ſhip a young man named Omai, a native of Ulietea, of whom ſo much hath ſince been known and written. This choice was at firſt diſapproved by captain Cook, who thought that this youth was not a proper ſample of the inhabitants of the Society iſlands; being inferior to many of them in birth and acquired rank, and not having any peculiar advantage with reſpect to ſhape, figure, or complexion. The captain afterwards found reaſon to be better ſatisfied with Omai's having accompanied our navigators to England. At Huaheine the veſſels, though their ſtay was ſhort, obtained very plentiful ſupplies of proviſions. Not leſs than 300 hogs, beſides fowls and fruit, were procured. From Huaheine our navigators ſailed for Ulietea, where trade was carried on in the uſual manner, and a moſt friendly intercourſe renewed between captain Cook and Oreo, the chief of the iſland. An interruption took place in the intercourſe between the ſhips and the natives, which was occaſioned by a miſapprehenſion on the part of the latter, and which upon proper explanation was ſoon rectified. So that proviſions were furniſhed at Ulietea no leſs plentifully than at Huaheine. Captain Cook eſtimated that the number of hogs, which had been obtained, amounted to 400 or upwards. Our commander, by his ſecond viſit to the Society iſlands, gained a farther knowledge of their general ſtate and of the cuſtom of the inhabitants. With regard to a certain diſorder, captain Cook was not able to determine whether it was known to the iſlanders before they were viſited by the Europeans; but he found upon inquiry that the introduction of it, if of recent origin, was unanimouſly aſcribed to the voyage of M. de Bougainville.

ville. Captain Cook wiſhed to ſatisfy himſelf, whether human ſacrifices conſtituted a part of the religious cuſtoms of theſe people. From Omai he afterwards learned that the inhabitants of the Society iſlands offer human ſacrifices to the Supreme Being. The knowledge he was able to obtain concerning their religion was very defective. With regard to the character of their women, he was enabled to rectify a prevailing error; and he does them juſtice by informing us, that the favours both of the married women and of the unmarried, of the better ſort, were as difficult to be obtained in the Society iſlands as in any other country. And as to the unmarried females of the lower claſs, there were many who would not admit of any indecent familiarities. This voyage enabled our commander to gain ſome further knowledge concerning the geography of the Society iſles; and he found it highly probable, that Otaheite is of greater extent than he had computed it in his former eſtimation. On the 17th of September captain Cook ſailed from Ulietea, directing his courſe to the weſt, with an inclination to the ſouth. Land was diſcovered on the 23d, to which he gave the name of “Harvey's iſland.” S. lat. 19°18'. W. long. 158°54'. On the 1ſt of October he reached the “iſland of Middleburg.” From Middleburg the ſhip ſailed to “Amſterdam,” the natives of which iſland were no leſs diſpoſed than thoſe of the former to maintain a friendly intercourſe with the Engliſh. A few old rags at this iſland were ſufficient for the purchaſe of a pig or a fowl.

Although the natives of Amſterdam were of a friendly diſpoſition, they were not entirely free from the thieviſh propenſity which pertained to the iſlanders of the Southern Ocean. The two iſlands of Middleburg and Amſterdam are guarded from the ſea by a reef of coral rocks, extending from the ſhore about 100 fathoms. Similar to this, in a great meaſure, is the ſituation of all the tropical iſles which our commander had ſeen in that part of the globe: and hence ariſes an evidence of the wiſdom and goodneſs of Providence; as by ſuch a proviſion nature has effectually ſecured them from the encroachments of the ſea, though many of them are mere points, when compared with the vaſt ocean by which they are ſurrounded The two iſlands above-mentioned are ſituated between the lat. of 21° 29' and 21° 3' S., and between the long. of 174° 40' and 175° 15' W. See AMSTERDAM and MIDDLEBURG.

On the 7th of October captain Cook proceeded on his voyage: next day he paſſed the “iſland of Pilſtart,” diſcovered by Tanoram, and ſituated in S. lat. 22° 26'. W. long. 175° 59'. On the 21ſt he made the land of New Zealand, at the diſtance of 8 or 10 leagues from Table cape. To a chief, who came off in a canoe, he gave two boars, two ſows, four hens, and two cocks, and a quantity of ſeeds, of wheat, French and kidney beans, peaſe, cabbage, turnips, onions, carrots, parſnips, and yams. On the 3d of November the Reſolution was brought into Ship Cove, in Queen Charlotte's Sound. After his arrival, the firſt object of the captain was to provide for the repair of his ſhip, and the next to examine into the ſtate of his bread, much of which had become unfit for uſe. To the inhabitants, who reſided at the Cove, he gave a boar, a young ſow, two cocks, and two hens, which he had brought from the Society Iſlands; and at the bottom of the weſt bay he ordered to be landed three ſows and a boar, together with two cocks and two hens; together with as much food as would laſt them 10 or 12 days. In the ſecond viſit of our navigators to New Zealand, they met with indubitable evidence that the inhabitants were eaters of human fleſh; but it was captain Cook's firm opinion, that the only fleſh that was eaten by theſe people was that of their enemies who had been ſlain in battle. Our commander did not leave New Zealand without making ſuch remarks on the coaſt between Cape Teerawhitte and Cape Palliſer, as may be of uſe to future navigators. As the Adventure had been ſeparated from the Reſolution, and was thought to be no where upon the iſland, captain Cook gave up all hopes of ſeeing her any more during the voyage. On the 26th of November the captain ſailed from New Zealand, in ſearch of a continent, and ſteered to the ſouth, inclining to the eaſt. Some days afterwards, our navigators reckoned themſelves to be antipodes to their friends in London, and conſequently at as great a diſtance from them as poſſible. The firſt ice iſland which they ſaw, was on the 12th of December, in S. lat. 62° 10'. W. long. 172°. In the proceſs of the voyage ſuch iſlands continually occurred, and the navigation became daily more difficult and dangerous. In S. lat. 67° 5', our voyagers all at once got within ſuch a cluſter of theſe iſlands, and of looſe pieces, that they found it almoſt impoſſible to eſcape. However, being releaſed, the Reſolution, on the 22d of the month, was in the higheſt latitude ſhe had yet reached, *viz.* 67° 31'. W. long. 142° 54'; and circumſtances became ſo unfavourable, that captain Cook determined to return towards the north. Here was no probability of finding land, or a poſſibility of getting farther ſouth. As our navigators advanced to the N.E., on the 24th, the ice-iſlands increaſed very much upon them; and in the midſt of about 100, they ſpent Chriſtmas day. As captain Cook, agreeably to his late reſolution, had traverſed a large extent of ocean, without ſeeing land, he again directed his courſe towards the ſouth; and by the 30th of January, 1774, after encountering innumerable obſtructions, he reached to S. lat. 71° 10'. W. long. 106° 54'. Farther it would have been extreme folly to have proceeded. The captain was of opinion, in which moſt of the gentlemen on board concurred, that the ice now in ſight extended quite to the pole, or might join to ſome land, to which it might have been fixed from the earlieſt time. Compelled at laſt by inevitable neceſſity to tack, and to ſtand towards the north, captain Cook formed a reſolution of ſpending the enſuing winter within the tropic. He was well ſatisfied, that no continent was to be found in this ocean, but that which muſt lie ſo far ſouth as to be wholly inacceſſible, on account of ice. If a continent exiſted in the Southern Atlantic Ocean, he was ſenſible that he muſt have the whole ſummer before him, in order to explore it. Upon the ſuppoſition, that no land could be found, he might reach the Cape of Good Hope by April: in that caſe he would have finiſhed the buſineſs of finding a continent, which was indeed the firſt object of the voyage. But this could not ſatisfy the comprehenſive and magnanimous mind of our commander. He had a good ſhip, expreſsly ſent out on diſcoveries, a healthy crew, and wanted neither ſtores nor proviſions. In ſuch circumſtances, to have quitted this Southern Pacific Ocean would have been betraying, as he thought, not only a want of perſeverance, but of judgment, in ſuppoſing it to have been ſo well explored, that nothing farther could be done. Although he had proved that, if there were a continent, it muſt lie far to the ſouth, there remained room for very large iſlands, in places as yet unexamined. He was alſo perſuaded, that his continuing for ſome time longer in this ſea would be ſerviceable to geography and navigation, and other ſciences. Thus he reaſoned; and accordingly it was his intention firſt to go in ſearch of the land, ſaid to have been diſcovered by Juan Fernandez, in the laſt century, in about the lat. of 38°; and if he failed in finding this land, he propoſed to direct his courſe in queſt of “Eaſter iſland,” or “Davis's land.” He next intended to go within the tropic, and ſo proceed weſtward till he arrived at Otaheite, where it was neceſſary for him to explore the Adventure. It was alſo in his contemplation to run as far weſt as the "Terra Auſtral del' Eſpiritu Santo," diſcovered by Quiros, and called by M. de Bougainville the "Great Cyclades." Hence he propoſed to ſteer to the ſouth, and ſo back to the eaſt, between the latitudes of 50° and 60°. In the execution of this plan, it was his purpoſe to attain the length of Cape Horn, in the enſuing November, when he ſhould have the beſt part of the ſummer before him, to explore the ſouthern part of the Atlantic ocean. When he communicated this extenſive plan, comprehending hazards and difficulties without number, to his officers, they unanimouſly and chearfully concurred. In purſuing his courſe to the north, captain Cook became well aſſured that the diſcovery of Juan Fernandez, if any ſuch was ever made, could be nothing more than a ſmall iſland. Our captain was at this time confined to his bed by a bilious colic: by the attention of Mr. Patten, the ſurgeon, he was relieved, and at length the diſorder ſubſided; but his ſtomach was ſo weak, that he could taſte nothing but the broth and fleſh of a favourite dog, belonging to Mr. Forſter. On the 11th of March our navigators came within ſight of "Eaſter iſland," or "Davis's land." in S. lat. 27° 5′ 30″. W. long. 109° 46′ 20″. On the 6th and 7th of April they came within ſight of four iſlands, which they knew to be the "Marqueſas." To one of them captain Cook gave ehe name of "Hood's iſland;" and as ſoon as the ſhip was brought to an anchor in Madre de Dios, or Reſolution bay, in the iſland of "Chriſtina," a traffic commenced, in the courſe of which the natives would frequently keep the goods, without making any return. Theft was ſo common, that it was impoſſible to guard againſt it; and one of the thieves was accidentally killed by a ſhot, in the act of ſtealing. After ſome time the trade was carried on in a better manner; and the ſhip was ſupplied with yams, plantains, bread-fruit, a few cocoa-nuts, fowls, and ſmall pigs. From the Marqueſas captain Cook ſteered for Otaheite, with a view of falling in with ſome of the iſlands diſcovered by former navigators, and eſpecially by the Dutch, the ſituation of which had not been accurately determined. In the courſe of the voyage he paſſed a number of low iſlets, connected together by reefs of coral rocks. One of theſe iſlands was "Tiookea," diſcovered and viſited by Byron. Beſides paſſing by "St. George's iſlands," ſo named by captain Byron, captain Cook diſcovered four others, which he called "Palliſer's iſles." On the 22d he anchored in Matavai bay, at Otaheite, where he took meaſures for the repairs of the ſhip. During his ſtay at Otaheite, he maintained a moſt friendly connection with the inhabitants; and a continual interchange of viſits took place between him and Otoo, Towka, and other chiefs of the country. On the 15th of May, our captain anchored in O'wharre harbour, in the iſland of Huaheine, where he procured bread-fruit, cocoa-nuts, and other vegetables in abundance; but there was a ſcarcity of hogs. When they were leaving the iſland, the good old chief, Oreo, was the laſt man that left the veſſel. At parting, captain Cook told him that they ſhould meet each other no more: Oreo wept, and ſaid, "let your ſons come, we will treat them well." At Ulietea nothing particular occurred. It was the laſt requeſt of Oreo, the chief, to captain Cook, that he would return; and when he could not obtain a promiſe to that effect, he aſked the name of his burying place. Oreo's anguiſh at parting was very great: "he looked up at the ſhip, burſt into tears, and then ſunk down into the canoe." On the 6th of June, the day after our voyagers left Ulietea, they ſaw land, which they found to be a low reef iſland, about four leagues in compaſs, and of a circular form, called "Howe iſland," diſcovered by captain Wallis, and ſituated in S. lat. 16° 46′. W. long. 154° 8′. Another reef iſland was ſeen on the 16th, to which captain Cook gave the name of "Palmerſton iſland," in S. lat. 18° 4′. W. long. 163° 10′. On the 20th land was again ſeen, called by captain Cook "Savage iſland," S. lat. 19° 1′. W. long. 169° 37′. Purſuing his courſe to the W.S.W., captain Cook paſſed by a number of ſmall iſlands, and on the 26th anchored on the north ſide of "Anamooka," or "Rotterdam," S. lat. 20° 15′. W. long. 174° 31′. While the captain was on ſhore at this iſland, he got the names of 20 iſlands which lie between the N.W. and N.E.; but two of them are moſt remarkable on account of their great height, *viz.* "Amattafoa," and "Oghao." From the N.W. to the S. of Rotterdam, round by the E. and N., it is encompaſſed by many ſmall iſles, ſand-banks, and breakers: no termination of them could be ſeen to the N., and they may poſſibly reach as far S. as Amſterdam, or Tongataboo. Together with Middleburg or Eaoowe and Pilſtart, theſe form a group, containing about three degrees of latitude and two of longitude; and captain Cook called them the "Friendly iſles, or Archipelago." Purſuing their courſe to the weſt, our navigators diſcovered land on the 1ſt of July, which they found to be a ſmall iſland, to which captain Cook gave the name of "Turtle iſle," on account of the number of turtle which were ſeen on the coaſt. On the 16th high land was ſeen to the S.W., which was the Auſtralis del' Eſpiritu Santo of Quiros, or the Great Cyclades of M. de Bougainville. After exploring the coaſt for ſome days, the captain anchored in a harbour of the iſland of "Mallicollo," which he called "Port Sandwich," ſituated on the N.E. ſide of the iſland, not far from the S.E. end, in S. lat. 16° 25′ 20″. E. long. 167° 57′ 23″. On the 23d of July our navigators, having gotten to ſea, diſcovered three or four ſmall iſlands; and at this time the Reſolution was not far from the "iſle of Ambryu," "the iſle of Paoom," and "the iſle of Apee;" S.E. of which latter iſland was diſcovered a group, which captain Cook called "Shepherd's iſles." Amidſt the number of iſlands now obſerved, one only appeared to be uninhabited: it conſiſted of a remarkable peaked rock, acceſſible only to birds, and obtained the name of the "Monument." In the farther courſe of the ſhip to the ſouthward, our navigators approached other iſlands, which they found to conſiſt of one large iſland, and three or four ſmaller ones. The two principal of the latter were called "Montagu" and "Hinchinbrook;" and the large iſland captain Cook named "Sandwich," in honour of his patron, the earl of Sandwich. Purſuing his diſcoveries, he came to an iſland, called by the natives "Erromangu," in a bay of which he anchored. As the inhabitants behaved treacherouſly, captain Cook called a promontory, or peninſula, near which a ſkirmiſh happened, "Traitor's Head," in S. lat. 18° 43′. E. long. 169° 28′. From this place the captain ſailed for an iſland, before diſcovered, on which he propoſed to make ſome ſtay, for the purpoſe of obtaining a ſupply of wood and water. This iſland was called "Tanna;" and three others near it were diſtinguiſhed by the names of "Immer," "Errona," or "Footoona," and "Annatom." The harbour in which he anchored was called by him "Port Reſolution," after the name of the ſhip; it was ſituated in S. lat. 19° 32′ 25½″, and E. long. 169° 44′ 35″. To this Archipelago, or group of iſlands, which captain Cook particularly examined, he gave the name of "New Hebrides." The ſeaſon of the year came on when captain Cook propoſed to return towards the ſouth; but he improved the intervening time in exploring any land which he might yet meet with between the New

Hebrides and New Zealand, at which place it was his intention to refreſh his people, and to renew his ſtock of wood and water for another ſouthern courſe. Sailing with this view, September the 1ſt, he diſcovered land on the 4th; and the Reſolution anchored next day in a harbour belonging to it. The inhabitants behaved to him in a very civil and friendly manner; and he returned their kindneſs with preſents to their chief. Captain Cook gave this iſland the name of "New Caledonia." On one of the ſmall adjoining iſlands the captain found a ſpecies of ſpruce pine, of which ſpars and very good maſts might be made, and called it the "iſle of Pines." To another, which afforded ample employment to the botaniſts, he gave the name of "Botany iſle." The captain, before he left this iſland, was enabled ſo far to ſurvey it as to aſcertain, that, excepting New Zealand, it is probably the largeſt iſland in the South Pacific ocean. Another iſland was obſerved of good height, and five leagues in circuit, to which was given the name of "Norfolk iſle," in S. lat. 29° 2′ 30″. E. long. 168° 16′. On the 18th of October our captain anchored in Ship Cove, in Queen Charlotte's Sound, on the coaſt of New Zealand; and his intercourſe with the inhabitants was altogether peaceable and friendly. Mr. Wales, on this occaſion, accurately aſcertained the latitude and longitude of this ſound, and found the bottom of Ship Cove to be in S. lat. 41° 5′ 56½″, and E. long. 174° 25′ 7½″. The 10th of November captain Cook left New Zealand, in the proſecution of his great object, or the determination of the queſtion concerning the exiſtence of a ſouthern continent. Having ſailed in different latitudes, extending from 43° to 55° 48′ S., till the 27th, the ſhip being in W. long. 138° 56′, he gave up all hopes of finding any more land in this ocean. He therefore reſolved to ſteer directly for the weſt entrance of the ſtraits of Magalhaens, with a view of coaſting the S. ſide of Terra del Fuego, round Cape Horn, to the ſtrait Le Maire. In the proſecution of this voyage, on the 17th of December, he reached the W. coaſt of Terra del Fuego, and on the 20th anchored in a place to which he gave the name of "Chriſtmas Sound." The whole coaſt and country were deſolate and unintereſting. Near every harbour, however, freſh water and wood for fuel were obtained. The country alſo abounds with wild fowl, and particularly geeſe. See CHRISTMAS *Sound*, and *Terra del* FUEGO. On the 28th, captain Cook left Chriſtmas Sound, and proceeded round Cape Horn, through ſtrait Le Maire, to Staten land. Having paſſed this famous Cape on the next day, he entered the ſouthern Atlantic ocean. On Staten iſland he found a port, on the 1ſt of January, which, from this circumſtance, was denominated "New Year's Harbour." In the ſmall iſlands adjacent to Staten land, and called "New Year's Iſles," captain Cook perceived a harmony between the different animals of the place, which he thought deſerving of being recorded. It ſeemed, he ſays, as if they had entered into a league not to diſturb each other's tranquillity. The greater part of the ſea coaſt is occupied by the ſea-lions; the ſea-bears take up their abode in the iſle; the ſhags are poſted on the higheſt cliffs; the penguins fix their quarter where they have the moſt ready communication with the ſea; and the reſt of the birds chuſe the moſt retired places. All theſe animals were occaſionally ſeen to mix together like domeſtic cattle and poultry in a farm yard, without any attempt on the part of one to moleſt the other. Nay, the captain had often obſerved the eagles and vultures ſitting on the hills among the ſhags, while none of the latter, whether old or young, appeared to be in the leaſt diſturbed at their preſence. Should it be aſked, how do theſe birds of prey live? The captain anſwers the queſtion, by ſuppoſing, that they feed on the carcaſes of ſeals and birds, which periſh by various cauſes. It is probable, from the immenſe quantity of animals with which the iſle abounds, that ſuch carcaſes exiſt in great numbers. On the 4th of January, captain Cook ſailed from Staten iſland, in order to reconnoitre that extenſive coaſt laid down by Mr. Dalrymple in his chart, in which is the gulf of St. Sebaſtian. As he had ſome doubt of the exiſtence of ſuch a coaſt, he determined to make the weſtern point of the gulf; but when he came to the different points of it, he could diſcover neither land nor any unequivocal ſigns of it. Proceeding in his voyage, land was ſeen on the 14th, but being almoſt wholly covered with ſnow, it was at firſt miſtaken for an iſland of ice. This was named from its firſt obſerver, "Willis's iſland," S. lat. 54°. W. long. 38° 23′. Another larger iſland, on which was a very conſiderable number of birds, was called "Bird iſland." On the 17th captain Cook landed in a bay of an extenſive tract of country, very deſolate in its appearance, which he took poſſeſſion of in his majeſty's name. The bay, ſituated in S. lat. 54° 5′. W. long. 37° 18′, he called "Poſſeſſion bay," and the country, which proved to be an iſland 70 leagues in circuit, was called the "iſle of Georgia," ſituated between 53° 57′, and 54° 57′ S. lat., and 38° 13′, and 35° 34′ W. long. On the 27th captain Cook, having left Georgia the 25th, computed that he was in S. lat. 60°. Here he was ſatisfied there could be no land in the direction towards the W., from which there was a long hollow ſwell; and hence he inferred, that the extenſive coaſt laid down in Mr. Dalrymple's chart of the ocean between Africa and America, and the gulf of St. Sebaſtian, doth not exiſt. An elevated coaſt, obſerved on the 31ſt, was called the "Southern Thule," S. lat. 59° 13′ 30′. W. long. 27° 45′. To the more diſtinguiſhed tracts of country, diſcovered from Jan. 31ſt to Feb. 6th, captain Cook gave the names of "Cape Briſtol," "Cape Montagu," "Saunders's iſle," "Candlemas iſles," and "Sandwich's land." The laſt is either a group of iſlands, or elſe a point of the continent; for the captain was firmly of opinion, that a conſiderable tract of land exiſted near the pole, which was the ſource of moſt of the ice that is ſpread over this vaſt ſouthern ocean. He thought it probable that this land muſt extend fartheſt to the N., where it is oppoſite to the ſouthern Atlantic and Indian oceans. Ice had always been found by him farther to the north in theſe oceans than any where elſe, and this he judged could not be the caſe if there were not land of conſiderable extent to the ſouth. See *Southern* CONTINENT.

Captain Cook having accompliſhed the great object of his navigation round the globe, began to direct his views towards England. Many circumſtances relating to the ſtate of his proviſions, and the health of his crew, contributed to haſten his return. In his courſe to the Cape of Good Hope, he ſearched for the iſles of "Denia" and "Marſeveen," laid down in Halley's variation chart, in S. lat. 41° 30′, and about 4° of longitude E. of the meridian of the Cape of Good Hope; but after ſailing from February 25th to March 13th, no ſuch iſlands could be diſcovered. On the 22d of March he anchored in Table bay; having ſailed from the time of leaving the Cape of Good Hope, to his return thither, no leſs than 20,000 leagues, which was an extent of voyage nearly equal to three times the equatorial circumference of the earth. It could not therefore be ſurpriſing, that the rigging and ſails of the Reſolution ſhould be eſſentially damaged, and even worn out; and yet in the whole of this run, made in every latitude between 9° and 71°, ſhe did not ſpring either low-maſt, top-maſt, lower or top-ſail yard; nor did ſhe ſo much as break a lower or top-maſt ſhroud; theſe happy circumſtances were owing to the good properties of the veſſel, and the ſingular care and abilities of her officers. Captain Cook having completed the neceſſary repairs, and ſupplied himſelf with requiſite ſtores and proviſions, left the Cape on the 27th of April, and reached the iſland of St. Helena on the 15th of May; on the 28th he anchored on the iſland of Aſcenſion, and arrived at the iſland of Fernando de Noronha, on the 9th of June. In the progreſs of the voyage, he made an experiment upon the ſtill for procuring freſh water; the reſult of which was, that the invention is uſeful upon the whole, but that it would by no means be adviſable to truſt to it entirely; more eſpecially as captain Cook was convinced, that nothing contributes more to the health of ſeamen, than a plentiful ſupply of water. On the 16th of July, the captain anchored in the bay of Fayal, one of the Azores iſlands; and on the 19th, proceeded with all expedition for England. On the 30th, he anchored at Spithead, and landed at Portſmouth; having been abſent from Great Britain three years and 18 days, during which time, and all changes of climate, he had loſt but four men, and only one of them by ſickneſs. The able manner in which captain Cook had conducted this voyage, and the diſcoveries he had made, could not fail to recommend him to the protection and encouragement of thoſe who had patronized the undertaking. The noble lord who had taken a lead in the plans of navigation and diſcovery, was ſtill at the head of the admiralty-board; and recommended by him to his majeſty, our navigator was raiſed, on the 9th of Auguſt, to the rank of a poſt-captain, and three days after, appointed a captain in Greenwich hoſpital; a ſituation which was intended to afford him a pleaſing and honourable reward for his illuſtrious labours and ſervices. Moreover, ſo important were his diſcoveries to ſcience in general, that on the 29th of February 1776, he was unanimouſly choſen a member of the Royal Society; and on the evening of the 7th of March, when he was admitted, a paper was read containing an account of the method he had taken to preſerve the health of the ſeamen. (See Philoſ. Tranſ. vol. lxvi. p. 402—406.) Another paper was communicated, at the requeſt of the preſident, ſir John Pringle, on the 18th of April, relative to the tides in the South Sea, *viz.* thoſe in the Endeavour river, on the eaſt coaſt of New Holland. (See Phil. Tranſ. ibid. p. 447, &c.) It was alſo reſolved by the preſident and council to beſtow on captain Cook ſir Godfrey Copley's gold medal. The preſident, according to his cuſtom, delivered an elaborate diſcourſe on the ſubject of the paper, which was thus diſtinguiſhed.

The particulars of this voyage were related by captain Cook himſelf, in a manner that redounds to his reputation as a writer. His ſtyle is natural, clear, and manly; being well adapted to the ſubject and to his own character. The ſuperintendence of the publication was undertaken by his learned and valuable friend, Dr. Douglas, who lately died in the ſee of Saliſbury, and whoſe promotion afforded pleaſure to perſons of literature of every denomination. The hiſtory of the voyage was recommended to the public by the accuracy and excellence of its charts, and by a great variety of engravings from the curious and beautiful drawings of Mr. Hodges. It was followed by the publication of the original aſtronomical obſervations, which had been made by Mr. Wales in the Reſolution, and Mr. Bayley in the Adventure.

The illuſion of a "Terra Auſtralis incognita," to any purpoſes of commerce, colonization, and utility, having been diſpelled; another geographical queſtion of very general intereſt remained to be determined; and that was the practicability of a northern paſſage to the Pacific ocean. Many perſons had conceived that there was a ſhorter, a more commodious, and a more profitable courſe of ſailing to Japan and China, and, indeed, to the Eaſt Indies in general, than by the tedious circuit of the Cape of Good Hope. To find a weſtern paſſage round North America had been attempted by ſeveral bold adventurers from Frobiſher's firſt voyage, in 1576, to thoſe of James and of Fox, in 1631. By theſe expeditions a conſiderable acceſſion was made to the knowledge of the northern extent of America, and Hudſon's and Baffin's bays were diſcovered. But the wiſhed-for paſſage, on that ſide, into the Pacific ocean, was ſtill unattained. Nor were the various attempts of our countrymen, and of the Dutch, to find ſuch a paſſage, by ſailing round the north of Aſia, in an eaſtern direction, attended with better ſucceſs. Wood's failure in 1676, ſeems to have terminated the long liſt of unfortunate expeditions in that century. The diſcovery had ceaſed for many years to be an object of purſuit. However, the queſtion was revived in the laſt century. Accordingly captain Middleton was ſent out by government in 1741, and captains Smith and Moore in 1746. But, though an act of parliament had been paſſed, enſuring a reward of 20,000*l.* to the diſcovery of a paſſage, the accompliſhment of their favourite object ſtill remained to be effected. Previouſly to the full execution of this deſign, lord Mulgrave ſailed with two ſhips, in order to determine how far navigation was practicable towards the north-pole. In this expedition his lordſhip encountered many difficulties. Nevertheleſs, the expectation of opening a communication between the Pacific and Atlantic ocean, by a northerly courſe, was not abandoned; and it was reſolved that a voyage ſhould be undertaken for that purpoſe. Captain Cook was inſtantly, and unanimouſly, thought to be in every reſpect the moſt proper perſon to accompliſh this difficult and hazardous, but very important and intereſting object. He had, however, done ſo much, and undergone ſo many trials, that his moſt zealous friends, and thoſe who were moſt ardently devoted to the object, could not think of aſking him to engage in freſh perils; the undertaking, however, became a ſubject of converſation at the table of lord Sandwich, when captain Cook was preſent. The object, with all the intereſts connected with it, excited the ardour of the captain's mind, and he offered to undertake the direction of the enterpriſe. The earl of Sandwich loſt no time; the matter was laid before the king; and captain Cook was appointed to the command of the expedition, Feb. 10, 1776. At the ſame time, it was agreed, that, on his return to England, he ſhould be reſtored to his ſituation at Greenwich: and, if no vacancy occurred during the interval, the officer who ſucceeded him was to reſign in his favour. All former navigators round the globe had returned to Europe by the Cape of Good Hope; but captain Cook undertook to accompliſh the arduous taſk by reaching the high northern latitudes between Aſia and America; and it is thought that the captain's own reflections on the ſubject ſuggeſted this plan. Inſtead, therefore, of a paſſage from the Atlantic to the Pacific, one from the latter into the former was to be tried. Accordingly captain Cook was ordered to proceed into the Pacific ocean, through the chain of new iſlands, which had been viſited by him in the ſouthern tropic. After having croſſed the equator into the northern parts of that ocean, he was to hold ſuch a courſe as might probably fix many intereſting points in geography, and produce intermediate diſcoveries, in his progreſs northward to the principal ſcene of his diſcoveries. With regard to his grand object, it was determined, after the moſt mature deliberation and inquiry, that, upon his arrival on the coaſt of New Albion, he ſhould proceed northward as far as the latitude of 65°, and not loſe any time in exploring rivers or inlets, or upon any other account, till he had gotten into that latitude. In the proſecution of this great deſign, motives of intereſt were annexed to obligations of duty. By a new law, paſſed in 1776, ſupplying the deficiencies of the act of 1745, it was enacted, "that if any ſhip belonging to any of his majeſty's ſubjects, or to his majeſty, ſhall find out, and ſail through, any paſſage, by ſea, between the Atlantic and Pacific oceans, in any direction, or parallel of the northern hemiſphere, to the northward of the fifty-ſecond degree of latitude, the owners of ſuch ſhips, if belonging to any of his majeſty's ſubjects, or the commander, officers, and ſeamen of ſuch ſhip belonging to his majeſty, ſhall receive, as a reward for ſuch diſcovery, the ſum of 20,000*l*." Two veſſels were fixed upon by government for the intended ſervice; the Reſolution and the Diſcovery; the former commanded by captain Cook, and the latter by captain Clerke. To the Reſolution was aſſigned the ſame number of officers and men, which ſhe had during her former voyage; and the only difference in the eſtabliſhment of the Diſcovery from that of the Adventure, was that ſhe had no marine officer on board. Both ſhips were equipped in the moſt complete manner, and furniſhed with ſuch an eſtabliſhment and apparatus, &c. as might moſt effectually conduce to the improvement of aſtronomy and navigation. As the ſhips were to touch at Otaheite and the Society iſlands, it was determined to carry Omai back to his native country, who returned with deep impreſſions of gratitude and reſpect for the liberal treatment which he had received during his abſence, and whilſt he continued in England. Captain Cook ſailed from the Nore to the Downs on the 25th of June, and on the 30th anchored in Plymouth Sound, where the Diſcovery was already arrived. On the 8th of July he received his inſtructions, with orders to proceed to the Cape of Good Hope. On the 12th he ſtood off Plymouth Sound, and proceeding in his courſe, touched at Teneriffe; anchoring on the 1ſt of Auguſt in the road of Santa Cruz. Having procured the neceſſary articles of refreſhment, he ſailed from Teneriffe on the 4th; and on the 13th arrived before Port Praya in the iſland of St. Jago, and then, not finding the Diſcovery there, ſtood out to the ſouthward. On the 1ſt of September, our navigator croſſed the equator in W. long. 27° 38′; and on the 8th, being near the eaſtern coaſt of Brazil, he took pains to ſettle its longitude, which he concluded to be 35½° or 36° W. On the 18th of October, the Reſolution came to an anchor in Table bay, at the Cape of Good Hope. On the 10th of November captain Cook had the ſatisfaction of ſeeing the Diſcovery arrive in the bay. Beſides the attention which our captain manifeſted to the ſtate of his ſhip, and the accommodation of his ſeamen in the further proſecution of his voyage, ſcientific objects engaged his particular notice. On the 30th of November he weighed from Table bay, and on the 3d of December got clear of the land. On the 12th land was ſeen, which was found, upon a nearer approach, to conſiſt of two iſlands. That which lies moſt to the ſouth, and is the largeſt, was eſtimated to be about 15 leagues in circuit; the northerly one was about nine leagues; and the two iſlands are about the diſtance of five leagues from each other. The largeſt lies in S. lat. 46° 53′, and E. long. 37° 46′; and the ſmaller one in S. lat. 46° 4′, and E. long. 38° 8′. They ſeemed to have a rocky and bold ſhore, and their ſurface is for the moſt part compoſed of barren mountains, the ſummits and ſides of which were covered with ſnow. Theſe two iſlands, with four others, which lie from nine to twelve degrees of longitude more to the eaſt, and nearly in the ſame latitude, had been diſcovered by captain Marion du Freſne, and Crozet, French navigators, in January 1772. As no names had been aſſigned to them in a chart of the Southern ocean, communicated by Crozet to captain Cook in 1773, our commander diſtinguiſhed the two larger ones by calling them "Prince Edward's iſlands." To the other four he gave the name of "Marion's" and "Crozet's" iſlands. Paſſing ſouthward of theſe iſlands, he ſhaped his courſe ſo as to get into the latitude of the land which had been diſcovered by M. de Kerguelen, a French navigator. On the 24th he obſerved land, which proved to be an iſland of conſiderable height, and about three leagues in circuit. He ſoon after diſcovered another iſland about the ſame ſize, and alſo a third, beſides ſome ſmaller ones. Another iſland was ſeen in S. lat. 48° 29′. E. long. 68° 40′, which was a high round rock, and which was called "Bligh's Cap." This he perceived to be the ſame with Kerguelen's "iſle of Rendezvous." As ſoon as the weather began to clear up, captain Cook ſteered in for the land, called "Kerguelen's land." At length a good harbour was diſcovered, in which the ſhips anchored on Chriſtmas day. Here the captain diſplayed the Britiſh flag, and named the place "Chriſtmas Harbour." On the 29th he left this harbour, and ranged along the coaſt, in order to diſcover its poſition and extent. In purſuing his courſe he met with ſeveral promontories and bays, together with a peninſula, all of which he has deſcribed and named. Another harbour, in which the ſhips anchored for one night, is ſituated in S. lat. 49° 3′, and E. long. 69° 37′, and was called "Port Palliſer." On the 30th, when this harbour was diſcovered, he came to a point, which proved to be the very eaſtern extremity of Kerguelen's land. This point was called "Cape Digby," and is ſituated in S. lat. 49° 23′, and E. long. 70° 34′. The reſult of captain Cook's examination of Kerguelen's land was, that it did not occupy an interval much exceeding 1¼ degree. From this deſolate coaſt our captain took his departure on the 31ſt, intending to touch at New Zealand; but on the 3d of January 1777, the wind veered to the north, and on the 12th the northerly winds ended in a calm; the ſhip being then in S. lat. 48° 40′. E. long. 110° 26′. On the 24th our voyagers diſcovered the coaſt of "Van Diemen's" land, and on the 26th came to an anchor in "Adventure bay." While captain Cook was at this country, he neglected no inquiry which could promote the knowledge of navigation, and other branches of ſcience. He ſettled the latitude and longitude of places, marked the variations of the compaſs, and recorded the nature of the tides. Adventure bay he found to be ſituated in S. lat. 43° 21′ 20″, and E. long. 147° 29′. On the 30th of January he ſailed from this bay, and on the 12th of February came to his old ſtation in Queen Charlotte's Sound, in New Zealand. Here he found that ten men, who had ſeparated from captain Furneaux's crew in the former voyage, had been murdered by the natives, and that their fleſh had been conſumed as food. The fear of revenge rendered them very averſe from approaching the Engliſh veſſels. On the 27th captain Cook got clear of New Zealand; and having met with unfavourable winds, it was not till the 29th of March that he diſcovered land, which was found to be an inhabited iſland, called "Mangeea," in S. lat. 21° 57′. E. long. 201° 53′. Purſuing his voyage, on the 30th he again found land, which was an iſland, called by the natives "Wateeoo," in S. lat. 20° 1′. E. long. 201° 45′. The next place which he viſited was a ſmall iſland called "Wennooa-ette," or "Otakootaia," in S. lat. 19° 15′. E. long. 201° 37.′ On the 5th he directed his courſe to "Harvey's iſland," which he had diſcovered in 1773, and which he now found to be well peopled. Having by various adverſe circumſtances been ſo much retarded in his progreſs, that nothing could be done this year in the high latitudes of the northern hemiſphere, he determined to bear away for the Friendly iſlands, where he was ſure of being abundantly provided. Accordingly he reached Palmerſton iſland in his courſe, where he obtained ſome refreſhment; and after leaving this iſland, he ſteered to the weſt, with a view of making the beſt of his way to "Annamooka." On the 28th of April, he touched at the iſland of "Komango," and on the 1ſt of May arrived at Annamooka. The only interruption of the harmony that ſubſiſted between our voyagers and the natives of this iſland aroſe from the thieviſh diſpoſition of many of them. In order to correct and counteract this propenſity, captain Clerke invented a mode of treatment which produced ſome effect, the putting of the thieves into the hands of the barber, who completely ſhaved their heads. They thus became objects of ridicule to their countrymen, and their rogueries were reſtrained. Captain Cook having exhauſted Annamooka of its articles of food, propoſed, on the 11th, to proceed directly for "Tongataboo." But it was recommended to him to touch at another iſland, or rather a group of iſlands, called "Hapaee," lying to the N.E., where he might be plentifully ſupplied with every refreſhment in the eaſieſt manner. Hapaee was therefore choſen for the next ſtation, where our commander arrived on the 17th, and met with a moſt friendly reception. Here the captain took an opportunity of examining not only Hapaee, but "Lefooga," and other neighbouring iſlands. On the 10th of June he arrived at "Tongataboo;" where he was kindly received, but ſomewhat moleſted by the thieviſh propenſity of the inhabitants. On the 10th he left Tongataboo, and two days after came to an anchor in the iſland of "Middleburg," or "Eooa," as it is called by the inhabitants. Captain Cook remained at the Friendly iſlands between two and three months; and his intercourſe with the natives was little interrupted. This intercourſe was productive of many advantages. See Friendly *iſlands.* On the 17th of July, captain Cook reſumed his voyage; and on the 8th of Auguſt, an iſland was diſcovered, called by the natives "Toobouai," and ſituated in S. lat. 23° 25′. E. long. 210° 37′. Purſuing his courſe he reached Otaheite on the 12th, and ſteered for Oheitepeha bay, deſigning to anchor there before he went down to Matavai. Omai's reception among his countrymen was not entirely of a flattering nature. Nothing that was peculiarly ſtriking occurred at their firſt meeting; his interview with his ſiſter, however, was agreeable to the feelings of nature; and his aunt threw herſelf at his feet, and bedewed them with tears of joy. On the 24th, the captain reſumed his old ſtation in Matavai bay. On this viſit he was fully ſatisfied that human ſacrifices formed a part of the religious inſtitutions of Otaheite; for he was witneſs to a ſolemnity of this kind, which he has particularly deſcribed with the juſt ſentiments of indignation and abhorrence. Here the captain was cured of a rheumatic complaint, extending from the hip to the foot in an extraordinary manner. The mother of Otoo, a chief of the iſland, his three ſiſters, and eight other women, undertook the cure. Being deſired to lay himſelf down amongſt them, as many as could get round him began to ſqueeze him with both hands, from head to foot, but more particularly in the part where the pain was lodged, till they made his bones crack, and his fleſh became a perfect mummy. After undergoing this diſcipline about a quarter of an hour, he was glad to be releaſed from his female friends. The operation, however, gave him immediate relief, ſo that he was encouraged to ſubmit to another rubbing down before he went to bed; the conſequence of which was, that he was tolerably eaſy the whole ſucceeding night. His female phyſicians repeated their preſcription the next morning, and again in the evening; after which his pains were entirely removed, and the cure was perfected. This operation, which is called "Romee," is univerſally practiſed among theſe iſlanders: being ſometimes performed by the men, but generally by the women. During this viſit of our voyagers to Otaheite, ſuch a cordial friendſhip and confidence ſubſiſted between them and the natives, as never once to be interrupted by any untoward accident. From Otaheite our voyagers ſailed on the 30th to Eimeo, where they anchored. The tranſactions on this iſland were, upon the whole, unpleaſant. On the 11th of October, the ſhip left it, and next day arrived at Owharre harbour, on the weſt ſide of Huaheine. Here they ſettled Omai to mutual ſatisfaction; having procured for him a portion of land and built a houſe, on the outſide of which was this inſcription:

Georgius Tertius, Rex. 2 *Novembris*, 1777.
Naves, { *Reſolution, Jac. Cook, Pr.*
Diſcovery, Car. Clerke, Pr.

After parting with Omai in an affectionate manner, and leaving him comfortably ſettled among ſeveral of his relatives, captain Cook arrived at Bolabola, the laſt of the Society iſlands, which he viſited on the 8th of December. Upon the whole, it has been obſerved, that the future felicity of the inhabitants of Otaheite, and the Society iſlands, will not a little depend on occaſional viſits from Europe, for it would have been better for theſe poor people, as captain Cook ſays, never to have known our ſuperiority in the accommodations and arts which render life comfortable, than, after once knowing it, to be again abandoned to their original incapacity of improvement. On the 8th of December our commander ſailed from Bolabola, and in the night between the 22d and 23d, croſſed the line in E. long. 203° 15′, and on the 24th diſcovered land, which was called "Chriſtmas iſland," the weſt ſide of it, on which was obſerved an eclipſe of the ſun, being in N. lat. 1° 59′. E. long. 202° 30′. On the 2d of January 1778, the ſhips reſumed their courſe towards the north, and in their progreſs diſcovered three iſlands. On the 22d they touched at one of theſe iſlands, called by the natives "Atooi," and where captain Cook found the horrid practice of eating human fleſh, which the inhabitants denominated "ſavoury eating." But it was aſcertained that enemies ſlain in battle, are the ſole objects of this abominable cuſtom. Near this was another iſland, called "Oneeheow," where our commander anchored on the 29th. It is obſerved, that the iſlands in the Pacific ocean, which European voyagers have diſcovered, have generally been found to lie in groups, or cluſters. This was the caſe with thoſe that were now viſited; and to which captain Cook gave the name of "Sandwich iſlands," which ſee. On the 2d of February, our navigators purſued their courſe to the northward; and on the 7th of March they diſcovered the coaſt of "New Albion," the ſhips being then in N. lat. 44° 33′. E. long. 235° 20′. In ranging on the weſt ſide of America, captain Cook gave names to ſeveral capes and head lands, which appeared in ſight. At length, on the 29th he anchored in an inlet, where the country appeared full of mountains, with ſnow covering their ſummits, interſperſed with vallies which produced high ſtraight trees, exhibiting a beautiful proſpect, as of one vaſt foreſt. The ſhips were now in N. lat. 49° 29′. E. long. 232° 29′. The inhabitants on the coaſt appeared to be diſpoſed to maintain a friendly intercourſe with ſtrangers; and a trade immediately commenced, the articles of which were the ſkins of various animals, ſuch as bears, wolves, foxes, deer, rackoons, polecats, and martins; and, particularly, ſea-otters. Garments made of theſe were alſo offered for ſale; the moſt extraordinary articles, however, were human ſkulls, and hands not quite ſtripped of their fleſh, ſome of which exhibited marks of having been upon the fire. In exchange the natives took knives, chiſſels, pieces of iron and tin, nails, looking-glaſſes, buttons, or any kind of metal. Although commerce was, in general, carried on with mutual honeſty, ſome of theſe people were no leſs inclined to theft than the iſlanders in the Southern ocean. Of all the uncivilized tribes, which our commander met with in his various navigations, he never found any who had ſuch ſtrict notions of their right to the excluſive property of every thing which their country produced, as the inhabitants of the Sound where he was now ſtationed. With captain Cook, very much to the honour of his character and of his country, it was a ſacred rule never to take any part of the property of the people whom he viſited, without an ample compenſation. Whilſt the ſhips were under repair for the proſecution of the expedition, our captain improved every opportunity that occurred for extending his knowledge of the manners and cuſtoms of the inhabitants, who, in general, treated him with great civility. The natives were much addicted to ſinging; and in ſome inſtances, the whole body joined, ſome in a ſlow, and others in a quicker time; accompanying their notes with the moſt regular motions of their hands, or with beating in concert with their paddles, on the ſides of the canoes, to which were added other very expreſſive geſtures. At the end of each ſong, they continued ſilent for a few moments, and then began again, ſometimes pronouncing the word *Hooee!* forcibly as a chorus. At our captain's firſt arrival in this inlet, he denominated it "King George's Sound;" but he afterwards was informed that the natives called it "Nootka." The entrance of the Sound is ſituated in the eaſt corner of Hope bay, in N. lat. 49° 53′. E. long. 233° 12′. On the 26th the repairs of the ſhips being completed, every thing was ready for the captain's departure. In the proſecution of the voyage to the north, and back again to the Sandwich iſlands, the incidents that occurred were chiefly of a nautical kind. The firſt place at which captain Cook landed, after his departure from Nootka Sound, was an iſland which he called "Kaye's iſland," ſituated at its S.W. point in N. lat. 59° 49′. E. long. 216° 58′. To an inlet in which the ſhips anchored on the 12th, he gave the appellation of "Prince William's Sound." Some days after leaving this Sound, our navigators came to an inlet, which they hoped would be found to communicate with the ſea to the north, or with Baffin's or Hudſon's bay to the eaſt; and therefore they determined particularly to examine it. In conſequence of a complete inveſtigation of this inlet, it was diſcovered to be a river, which was afterwards called "Cook's river." On the 6th of June they got clear of this river, and purſuing their voyage, they ſailed on the 19th, amidſt the group of iſlands, which had been called by Beering "Schumagin's iſlands." On the 21ſt, among ſome hills, on the main land, that towered above the clouds to a moſt amazing height, one was diſcovered to have a volcano, which continually threw up vaſt columns of ſmoke. It does not ſtand far from the coaſt, and is ſituated in N. lat. 54° 48′, and long. 195° 45′. The mountain is of a completely conical figure, and the volcano is at its very ſummit. A canoe, from an iſland in the neighbourhood, approached the ſhip, and the ſingle perſon on board bowed as he came near. From ſuch tokens of politeneſs, our captain reaſonably inferred, that the Ruſſians muſt have ſome communication and traffic with theſe people. On the 27th our voyagers reached an iſland, known by the name of "Oonalaſhka," the inhabitants of which behaved with a degree of politeneſs uncommon to ſavage tribes. The harbour of "Samgamooda," on the north ſide of the iſland, in which captain Cook came to an anchor, is ſituated in N. lat. 53° 55′. E. long. 193° 30′. On the 2d of July our voyagers left Oonalaſhka, and on the 16th were within ſight of a promontory, on which lieutenant Williamſon landed; but he found that the land, as far as his view extended, produces neither tree nor ſhrub, though the lower grounds were not deſtitute of graſs, and of ſome other plants. To this promontory, in N. lat. 58° 42′. E. long. 197° 36′, was given the name of "Cape Newenham." When our navigators, on the 3d of Auguſt, had advanced to the latitude of 62° 34′, they had the misfortune to loſe Mr. Anderſon, the ſurgeon of the Reſolution, who had for more than twelve months been lingering under a conſumption. Mr. Anderſon, who was a perſon of a cultivated underſtanding and agreeable manners, to diſtinguiſhed ſkill in his own profeſſion, added a very conſiderable knowledge in other branches of ſcience. An iſland, diſcovered ſoon after his death, was honoured with the appellation of "Anderſon's iſland." On the 9th captain Cook anchored under a point of land, to which he gave the name of "Cape Prince of Wales," ſituated in N. lat. 65° 46′. E. long. 191° 45′, and remarkable for being the moſt weſtern extremity of America hitherto explored. This extremity is diſtant from the eaſtern cape of Siberia only 13 leagues; and there our commander had the glory of aſcertaining the vicinity of the two continents, which had only been conjectured from the reports of the neighbouring Aſiatic inhabitants, and the imperfect obſervations of the Ruſſian navigators. Reſuming his courſe on the 10th, captain Cook anchored in a bay, the land of which was at firſt ſuppoſed to be a part of the iſland "Alaſchka;" but from the figure of the coaſt, from the ſituation of the oppoſite ſhore of America, and from the longitude, the captain thought to be more probably the country of the "Tſchutſki," on the eaſtern extremity of Aſia, which had been explored by Beering in 1728; and this was found to be the fact. From the bay of St. Lawrence, belonging to the country of the Tſchutſki, our navigators ſteered, on the 11th, to the eaſt, in order to get nearer to the coaſt of America. Afterwards, proceeding to the north, they reached, on the 17th, the latitude of 70° 33′, in longitude 197° 41′. On this day a brightneſs was perceived in the northern horizon, reſembling that which is reflected from ice, and which is commonly called the *blink*. In about an hour's time, the ſight of a large field of ice removed all doubt in captain Cook's mind with reſpect to the cauſe of the brightneſs of the horizon. The ſhips were ſoon cloſe to the edge of the ice, in lat. 70° 41′, and unable to proceed any farther. On the 18th, in lat. 70° 44′, the ice near them was as compact as a wall, and judged to be at leaſt ten or twelve feet high. Farther to the north, it appeared much higher. A prodigious number of ſea-horſes lay upon the ice; and ſome of them were procured for food, in order to ſupply the want of freſh proviſions. Our voyagers lived on the ſea-horſes as long as they laſted; and they were generally preferred to ſalt proviſions. Captain Cook continued, until the 29th, to traverſe the Icy ſea beyond Beering's ſtrait, in various directions, and through numberleſs obſtructions and difficulties. The ſeaſon, indeed, was now ſo far advanced, that it would have been highly imprudent to have made any farther attempts, till the next ſummer, at finding a paſſage into the Atlantic. Our commander's attention was now directed to the diſcovery of a proper place for obtaining a ſupply of wood and water; and to the manner in which he ſhould ſpend the winter, with ſome improvements in geography and navigation, and ſo as to be in a condition to return to the north, for a farther ſearch of a paſſage, in the enſuing ſummer. Before he proceeded to the ſouth, he employed a conſiderable time in examining the ſea and coaſts in the vicinity of Beering's ſtrait, on the ſide both of Aſia and America. In this examination, he aſcertained the accuracy of Beering, ſo far as he went; demonſtrated the errors with which Stæhlin's map of the new northern Archipelago abounds; and made large additions to the geographical knowledge of this part of the world. “It reflects,” as Mr. Coxe juſtly obſerves, “the higheſt honour even on the Britiſh name, that our great navigator extended his diſcoveries much farther in one expedition, and at ſo great a diſtance from the point of his departure, than the Ruſſians accompliſhed in a long ſeries of years, and in parts belonging or contiguous to their own empire.”

On the 2d of October, our voyagers came within ſight of the iſland of Oonalaſhka, and anchored again in Samganoodah harbour. Here, whilſt the ſhips were repairing, the ſeamen collected berries, with which the iſland abounds, and which, in conjunction with the ſpruce-beer, contributed effectually to eradicate every ſeed of the ſcurvy that might exiſt in either of the veſſels. They alſo procured an ample ſupply of fiſh. Captain Cook, on the 8th, received a very ſingular preſent, which was a rye-loaf, or rather a pye in the form of a loaf, for it incloſed ſome ſalmon, highly ſeaſoned with pepper. Captain Clerke received alſo the ſame kind of preſent. Theſe preſents, it was reaſonably ſuppoſed, came, by the hands of an Oonalaſhkan, from ſome Ruſſians in the neighbourhood. On the 10th corporal Lediard of the marines returned from his reſearches with three Ruſſian ſeamen, or furriers, who, with ſeveral others, reſided at “Engooehſhar,” where they had a dwelling-houſe, ſome ſtore-houſes, and a ſloop of about 30 tons burthen. From theſe perſons captain Cook derived every poſſible degree of information. Afterwards, another Ruſſian was introduced to our captain, whoſe name was Eraſim Gregorioff Sin Iſmyloff, and who was the principal perſon among his countrymen in this and the neighbouring iſlands. From him he obtained two charts, which he was permitted to copy. The firſt included the “Penſhinkian” ſea; the coaſt of Tartary, down to the latitude of 41°; the Kuril iſlands; and the peninſula of Kamtſchatka. The ſecond chart, which was the moſt intereſting, comprehended all the diſcoveries made by the Ruſſians to the eaſtward of Kamtſchatka, towards America; which, however, excluſively of the voyages of Beering and Tſcherikoff, amounted to little or nothing. Indeed captain Cook was aſſured, that no Ruſſians had even ſeen any part of the continent of America to the northward, excepting that which lies oppoſite to the country of the Tſchutkis. On the 26th, all things being ready for captain Cook's departure, he put to ſea, and ſailed for the Sandwich iſlands; it being his intention to ſpend a few months there, and then to direct his courſe to Kamtſchatka, ſo as to endeavour to reach that country by the middle of May, in the enſuing ſummer. On the 26th of November, when the ſhips had proceeded ſouthward to the latitude of 20° 55′, land was diſcovered, which proved to be the iſland of “Mowee,” one of the group of the Sandwich iſlands, with the inhabitants of which a friendly intercourſe was maintained. Another iſland was diſcovered on the 30th, called by the natives “Owhyhee.” Among the articles procured from the natives, was a quantity of ſugar-cane, a ſtrong decoction of which was found, upon trial, to be a very palatable beer; more eſpecially when improved with a few hops. On the 16th of January 1779, canoes in great numbers came out from all parts of the iſland, ſo that the two ſhips were ſurrounded with no fewer than a thouſand, crowded with people and laden with hogs, and other productions of the iſland. Some of them, however, manifeſted a thieviſh diſpoſition, and captain Cook, in order to check it, ordered two or three muſkets, and as many four pounders, to be fired over one of the canoes, which had carried away a rudder. Into a bay, affording good anchorage and freſh water, captain Cook reſolved to take the ſhips in order to refit, and to obtain every refreſhment which the place could afford. The bay in which the ſhips anchored on the 17th was called by the inhabitants “Karakakooa.” The veſſels were ſoon ſurrounded with a multitude of canoes; and the whole ſhore of the bay was covered with ſpectators, whilſt many hundreds were ſwimming round the ſhips like ſhoals of fiſh. Our navigators were much impreſſed by the ſingularity of the ſcene; and few of them lamented their unſucceſsful endeavours of getting homeward, the laſt ſummer, by a northern paſſage. “To this diſappointment,” ſays the captain, “we owed our having it in our power to reviſe the Sandwich iſlands, and to enrich our voyage with a diſcovery, which, though the laſt, ſeemed, in many reſpects, to be the moſt important that had hitherto been made by Europeans, throughout the extent of the Pacific ocean.” Such, alas! is the concluding ſentence of our illuſtrious commander's journal. Little did he then imagine, that a diſcovery which promiſed to annex no ſmall honour to his name, and to be productive of very agreeable conſequences, would be ſo fatal in the reſult. Little did he think, that the iſland of Owhyhee was deſtined to be the laſt ſcene of his exploits and the cauſe of his deſtruction.

The reception which the captain met with from the natives, on his proceeding to anchor in Karakakooa bay, was in a very high degree encouraging. The natives expreſſed their joy by ſinging and ſhouting, and by exhibiting a variety of wild and extravagant geſtures. During the long cruiſe of our navigators off the iſland of Owhyhee, the inhabitants had conducted themſelves in their dealings, almoſt univerſally, with fairneſs and honeſty; but after the arrival of the ſhips in the bay, they altered their conduct. The immenſe crowds of iſlanders that encompaſſed the ſhips afforded frequent opportunities of pilfering without the riſk of detection, and held out, eſpecially as their number was much ſuperior to that of the Engliſh, the proſpect of eſcaping with impunity. Another circumſtance to which the alteration in the conduct of the natives may be aſcribed, aroſe from the preſence and encouragement of their chiefs, into whoſe poſſeſſion the booty might be traced, and who were probably the inſtigators of the depredations that were committed. Soon after the Reſolution had gotten into her ſtation, three chiefs, one of whom named Koah, who was a prieſt, and in his youth had been a diſtinguiſhed warrior, viſited the ſhip; and in the evening, captain Cook, accompanied by Mr. Bayley and Mr. King, attended him on ſhore. The captain was received with great civility and a reſpect, on the part of the natives, approaching to adoration. The captain was particularly deſirous of procuring from the iſland ſome ſalted hogs for ſea-ſtore; and, with this view, of renewing former attempts in the operation for this purpoſe. The event anſwered his moſt ſanguine expectations. On the 26th captain Cook had his firſt interview with Terreeoboo, the king of the iſland; which was conducted with a variety of ceremonies, among which, the cuſtom of exchanging names, which among the iſlanders of the Pacific ocean is the ſtrongeſt pledge of friendſhip, was obſerved. The king, attended by ſeveral chiefs, was conducted in a pinnace on board the Reſolution; where they were received, apparently much to their ſatisfaction, with peculiar attention and reſpect. In the progreſs of the intercourſe which was carried on between our voyagers and the natives, the quiet and inoffenſive behaviour of the latter took away every apprehenſion of danger and inſpired an unſuſpecting confidence in the Engliſh. A ſociety of prieſts, in particular, diſplayed a generoſity and munificence, of which there are few examples; for they furniſhed a conſtant ſupply of hogs and vegetables to our navigators, without ever demanding, or even ſuggeſting, a return. Indeed, the conduct of the warrior chiefs, or *Earees*, was always leſs ſatisfactory than that of the prieſts. Although the kind and liberal behaviour of the natives continued without remiſſion, Terreeoboo, and his chiefs, began at length to be very inquiſitive about the time of the departure of the Engliſh; but this is not ſurpriſing, when we conſider the enormous conſumption of hogs and vegetables, which had taken place during their abode of 16 days in the bay. When the king was informed that they were to leave the iſland in a day or two, a proclamation was made through the iſland, requiring the people to bring their hogs and vegetables, that they might be preſented by the king to the *Orono*, the title of reſpect given to captain Cook, on his quitting the country. Accordingly, on the 3d of February, being the day preceding that which was fixed for leaving the iſland, Terreeoboo invited captain Cook and Mr. King to attend him to the place where Kaoo reſided. On their arrival, they found the adjoining ground covered with parcels of cloth, and at a little diſtance an immenſe quantity of vegetables; and near them was a large herd of hogs. At the cloſe of the viſit a great part of the cloth, and all the vegetables and hogs were given by Terreeoboo to captain Cook and Mr. King, who were aſtoniſhed at the value of the preſent. Such was the attachment of the inhabitants of Owhyhee to Mr. King, that Terreeoboo and Kaoo waited upon captain Cook, whoſe ſon they ſuppoſed him to be, to ſolicit his reſidence in their country. Early on the 4th the ſhips ſailed out of Karakakooa bay, being followed by a large number of canoes. It was the captain's deſign, before he viſited the other iſlands to make a complete ſurvey of Owhyhee, in hopes of finding a better ſheltered bay than that which he had left; and upon failure of ſucceſs to take a view of the ſouth-eaſt part of Mowee, where, as he was informed, he might find an excellent harbour. After ſailing about the iſland of Owyhee for ſeveral days, the weather being ſtormy, and the foremaſt of the Reſolution being damaged, our navigators returned on the 11th to Karakakooa bay; but in coming to an anchor, they found their reception to be very different from what it had been on their firſt arrival. Their anxiety, however, was in ſome meaſure relieved, by the return of a boat which had been ſent on ſhore, and which brought information, that Terreeoboo was abſent, and had left the bay under the *Taboo*. The behaviour of the natives, however, appeared myſterious and excited ſuſpicion; the interdiction of intercourſe, on pretence of the king's abſence, afforded reaſon for apprehending that he only wiſhed to gain time for conſulting with his chiefs. On the next morning Terreeoboo arrived and immediately viſited captain Cook; this circumſtance, and the return of the natives to their uſual friendly intercourſe, were conſidered as ſtrong proofs, that they neither meant, nor apprehended, any change of conduct. Some other incidents confirmed this opinion. Towards the evening of the 13th information was received, that ſeveral chiefs aſſembled at the well near the beach and drove away the natives who had been hired to aſſiſt the ſailors in rolling down the caſks to the ſhore. It was afterwards found, that the iſlanders had armed themſelves with ſtones and were very tumultuous. Not to mention ſome inſtances of theft and ſubſequent diſſenſions which occurred, one of a very ſerious and unpleaſant nature happened, which it may not be improper to ſpecify on account of the conſequences that enſued. A canoe, belonging to Pareea, was ſeized; and he, proteſting his innocence with regard to the theft that had been committed, claimed his property. A ſcuffle took place between him and the Engliſh officer with ſome of his companions, in which Pareea was knocked down by a violent blow on the head, with an oar. The natives, who had been peaceable ſpectators, immediately attacked the Engliſh ſeamen with a ſhower of ſtones, which obliged them precipitately to retreat and to ſwim off to a rock at ſome diſtance from the ſhore. The pinnace, which was waiting for captain Cook's return, was immediately ranſacked by the iſlanders; and if it had not been for the ſeaſonable interpoſition of Pareea, would have been entirely demoliſhed, Pareea interfered further in reſtoring the pinnace; and being aſſured that he would be kindly received by the *Orono*, joined noſes (according to their cuſtom) with the officers, in token of friendſhip, and paddled over to the village of Kowrowa. Captain Cook, on being informed of this occurrence, expreſſed much uneaſineſs: "I am afraid," ſays he, "that theſe people will oblige me to uſe ſome violent meaſures; for," he added, "they muſt not be left to imagine, that they have gained an advantage over us." The confidence of our navigators in the natives gradually abated; and they thought it neceſſary to be very much upon their guard. At this time the cutter belonging to the Diſcovery was ſtolen, and captain Cook made the neceſſary preparations for the recovery of it. On occaſions of a ſimilar kind, it had been his practice to get the king, or ſome of the principal *Erees*, on board, and to detain them as hoſtages till the article, that had been loſt, was reſtored. This method he meant now to purſue; and he alſo gave orders to ſtop all the canoes that ſhould attempt to leave the bay, with an intention of ſeizing and deſtroying them, if by peaceable means he could not recover the cutter. Captain Cook and Mr. King, together with Mr. Philips, and nine marines, left the ſhip; and when they landed, the captain inſtructed Mr. King to quiet the minds of the natives, by aſſuring them they ſhould not be hurt, to keep his people together, and to be on his guard. Whilſt Mr. King was employed in executing his commiſſion, captain Cook proceeded to Kowrowa, where the king reſided, and landed with the lieutenant and nine marines. The people received him with the uſual tokens of reſpect; proſtrating themſelves before him, and bringing their cuſtomary offerings of ſmall hogs. Having gained an interview with Terreeoboo, he invited him to return in the boat, and ſpend the day on board the Reſolution. To this propoſal the old king aſſented, and immediately accompanied him. One of the king's favourite wives, however, beſought him, with many tears and intreaties, not to go on board; and two chiefs, who accompanied her, forced him to ſit down. The natives, who were collecting in great numbers on the ſhore, and who had been alarmed by the hoſtilities that had previouſly occurred in the bay, thronged round captain Cook and their king. The lieutenant of marines, perceiving that they were much preſſed, and thus rendered incapable of uſing their arms, if occaſion ſhould require it, propoſed to the captain to draw them up along the rocks, cloſe to the water's edge; and accordingly they formed a line, at the diſtance of about 30 yards from the place where the king was ſitting. The old king appeared to be much alarmed; and when captain King urged him to proceed, the chiefs interpoſed, and at firſt by prayers and intreaties, and afterwards by force and violence, inſiſted on his ſtaying where he was. The captain at length deſiſted; obſerving to Mr. Philips, that it would be impoſſible to compel him to go on board, without the riſk of killing a great number of the inhabitants. Captain Cook's perſon had hitherto appeared to be in no danger; but a circumſtance accidentally occurred, which gave a fatal turn to his ſituation. The boats, which had been ſtationed acroſs the bay to prevent the eſcape of the canoes, fired at ſome of them that were endeavouring to go off, and unfortunately killed a chief of the firſt rank. The news of his death arrived at the village, where captain Cook was, juſt as he had left the king, and was walking ſlowly toward the ſhore. Upon this, the women and children were immediately ſent off; and the men put on their war-mats, and armed themſelves with ſpears and ſtones. One of the natives, having in his hands a ſtone, and a long iron ſpike (called a *pahooa*), advanced to the captain, flouriſhing his weapon in defiance, and threatening to throw the ſtone. The captain, after having ineffectually deſired him to deſiſt, fired a load of ſmall ſhot, which, as the man had on his war-mat, ſerved only to irritate and encourage the enraged people. Several ſtones were thrown at the marines; and one of the *Erees* attempted to ſtab Mr. Philips with his *pahooa*, but failed in the attempt. Captain Cook now fired his ſecond barrel, loaded with ball, and killed one of the foremoſt of the natives. A general attack with ſtones immediately followed, which was returned by a diſcharge of muſquetry from the marines, and the people in the boats. The iſlanders, contrary to expectation, ſtood the fire with great firmneſs; and before the marines had time to reload, broke in upon them with dreadful ſhouts and yells. Four marines were cut off among the rocks, in their retreat; three more were dangerouſly wounded; and the lieutenant, who had received a ſtab between the ſhoulders with a *pahooa*, having fortunately reſerved his fire, ſhot the man who had wounded him, juſt as he was going to repeat his blow. The unfortunate commander, the laſt time in which he was diſtinctly ſeen, was ſtanding at the water's edge, and calling out to the boats to ceaſe firing, and to pull in. If it be true, as ſome of thoſe who were preſent imagined, that the mariners and boatmen had fired without his orders, and that he was deſirous of preventing any further bloodſhed, it is not improbable that his humanity, on this occaſion, proved fatal to him. For it was remarked, that whilſt he faced the natives, none of them had offered him any violence; but that having turned about, to give his orders to the boats, he was ſtabbed in the back, and fell with his face into the water. On ſeeing him fall, the iſlanders ſet up a great ſhout, and his body was immediately dragged on ſhore, and ſurrounded by the enemy, who, ſnatching the dagger out of each other's hands, ſhewed a ſavage eagerneſs to have a ſhare in his deſtruction. "Thus fell," ſays captain King, "our great and excellent commander!" For other particulars, we refer to "Samwell's Narrative of the Death of Captain Cook."

In conſequence of the ſavage diſpoſition of the natives, the whole remains of captain Cook could not be recovered. Although various means, ſoothing and menacing, were employed for this purpoſe, little more than the principal part of the bones could be procured. By the poſſeſſion of theſe, our navigators were enabled to perform the laſt offices to their eminent and unfortunate commander. The bones, having been put into a coffin, and the ſervice being read over them, were committed to the deep, on the 21ſt, with the uſual military honours. What were the feelings of the companies of both the ſhips, on this occaſion, the world muſt be left to conceive; for thoſe who were preſent know, that it is not in the power of any pen to deſcribe them.

Such was the high eſtimation in which the character and enterpriſes of captain Cook were held by neighbouring nations, that, when war was declared between France and England, a letter was iſſued, on the 15th of March, 1779, by Monſ. Sartine, ſecretary of the marine department at Paris, and ſent to all the commanders of the French ſhips, which, after doing honour to the importance and utility of his diſcoveries, ordered, that the ſhip of captain Cook ſhould be treated with reſpect at ſea. The adoption of this meaſure was ſuggeſted by Monſ. Turgot, who alſo compoſed a memorial, in which he proved that honour, reaſon, and even intereſt, dictated this act of reſpect for humanity; and it was in conſequence of this memorial, as we learn from M. Condorcet (in his Life of M. Turgot), that an order was given not to treat as an enemy the common benefactor of every European nation. The firſt thought of ſuch a plan of conduct was very probably ſuggeſted by Dr. Benjamin Franklin, who, when he was ambaſſador at Paris from the United States of America, preceded the court of France in iſſuing a ſimilar requiſition.

We ſhall cloſe this article, as far as it reſpects the diſcoveries of captain Cook, with merely mentioning, that the Sandwich iſlands were further explored; that Kamtſchatka was viſited, and a very friendly intercourſe maintained with the Ruſſian officers of that country; that our navigators experienced the moſt generous and hoſpitable treatment from major Behm, in particular, the commander of the garriſon at Bolcharetſk; that they proceeded to the north, in purſuit of the grand object of the expedition; that, having paſſed through Beering's ſtrait, and attained to ſomewhat more than 69½ degrees of northern latitude, they found it abſolutely impoſſible to penetrate through the ice, either on the ſide of America or on the ſide of Aſia; that every hope being precluded of accompliſhing, in this way, a paſſage into the Atlantic ocean, captain Clerke was obliged to come to the determination of ſailing back to the ſouthward; that on the 22d of April (1779) the captain died of a conſumption (ſee his article); that captain Gore ſucceeded to the command of the Reſolution, and lieutenant King to that of the Diſcovery; that a ſecond viſit was paid to Kamtſchatka, which extended our acquaintance with that part of the world; that no ſmall acceſſion of information was acquired, with reſpect to geographical ſcience in general; that our voyagers purſued their courſe by the coaſts of Japan and China; that they made ſome ſtay at Canton; that thence they proceeded to the Cape of Good Hope; that they came to an anchor at Stromneſs, on the 22d of May, 1780; that both ſhips arrived at the Nore, on the 4th of October, after an abſence of 4 years, 2 months, and 22 days; that, during the whole of the expedition, the Reſolution loſt only five men by ſickneſs, three of whom were in a precarious ſtate of health at their departure from England, while the Diſcovery did not loſe a ſingle man; and that the hiſtory of the voyage, from the time in which captain Cook's journal ends, was written with great ability by Mr. King. By the deceaſe of captain King, who died at Nice in Italy, in 1784, this country ſuſtained another loſs of an able and ſcientific commander and navigator, who hath left a memorial of his talents and ſervices, which has honourably united his name with that of the immortal Cook.

In ſketching the talents and character of captain Cook, ſtrikingly illuſtrated in the actions and enterpriſes of his life, we ſhall avail ourſelves of the aſſiſtance that is afforded us by his profeſſed or incidental biographers. Captain Cook poſſeſſed, in an eminent degree, an inventive mind, which, by its native vigour, ſuggeſted noble objects of purſuit, and the moſt effectual methods of proſecuting and attaining them. This faculty he exemplified in a great variety of critical and difficult ſituations. To this kind of genius he added unwearied application. By his genius and unremitting aſſiduity he acquired an extenſive acquaintance, not only with navigation, but with many other ſciences. He was ſo well informed with regard to different branches of the mathematics, and particularly in aſtronomy, that he was able to take the lead in various obſervations of an aſtronomical kind, in the courſe of his voyages. In general literature, and even the art of compoſition, he was ſo great a proficient, that he acquired reputation, not merely as the performer, but as the narrator, of his various intereſting enterpriſes. Perſeverance and ſteadineſs in the proſecution of the objects to which his life was devoted, were diſtinguiſhing features of his character; and ſuch was the invincible fortitude of his ſpirit, that no difficulties or dangers intimidated him, or deterred him from accompliſhing any purpoſe which he formed, or which the hazardous ſervices aſſigned him required. His fortitude was of courſe accompanied with complete ſelf-poſſeſſion. This latter quality was eminently uſeful to him in many critical and trying circumſtances. Accordingly it is obſerved, that the calmneſs and compoſure of his mind were ſuch, that, after having given neceſſary directions, he could take his reſt, and ſleep during the hours which he allotted to himſelf with perfect ſoundneſs. To the great qualities poſſeſſed by captain Cook, he added the moſt amiable and conciliatory virtues. His humanity is illuſtrated in the whole courſe of his conduct, during his ſucceſſive voyages; with regard to the inhabitants of the countries which he viſited, and with reſpect to the accommodation, health, and comfort of his own ſeamen. In the private relations of life, he maintained an excellent and exemplary character, as a huſband and father, and as a ſincere and ſteady friend: and his ſobriety and virtue gave ſtability and ſecurity to every other moral qualification. He was alſo diſtinguiſhed by the ſimplicity of his manners. In converſation he was unaffected and unaſſuming; and yet, on neceſſary occaſions, obliging and communicative. To this general account of his talents and virtues, we ſhall ſubjoin ſome delineations of his character by thoſe who were in habits of intimate acquaintance with him, and who had an opportunity of marking his temper and conduct in the various trying circumſtances that occurred in the courſe of his life. Captain King, the continuator of the journal of his laſt voyage, has given us the following ſketch of his character: "The conſtitution of his body was robuſt, inured to labour, and capable of undergoing the ſevereſt hardſhips. His ſtomach bore, without difficulty, the coarſeſt and moſt ungrateful food. Indeed temperance in him was ſcarcely a virtue; ſo great was the indifference with which he ſubmitted to every kind of ſelf-denial. The qualities of his mind were of the ſame hardy, vigorous kind with thoſe of his body. His underſtanding was ſtrong and perſpicacious; his judgment, in whatever related to the ſervices he was engaged in, quick and ſure. His deſigns were bold and manly; and both in the conception, and in the mode of execution, bore evident marks of a great original genius. His courage was cool and determined, and accompanied with an admirable preſence of mind in the moment of danger. His manners were plain and unaffected. His temper might perhaps have been juſtly blamed, as ſubject to haſtineſs and paſſion, had not theſe been diſarmed by a diſpoſition the moſt benevolent and humane. Such were the outlines of captain Cook's character; but its moſt diſtinguiſhed feature was that unremitting perſeverance in the purſuit of his object, which was not only ſuperior to the oppoſition of dangers, and the preſſure of hardſhips, but even exempt from the want of ordinary relaxation. During the long and tedious voyages in which he was engaged, his eagerneſs and activity were never in the leaſt abated. No incidental temptation could detain him for a moment; even thoſe intervals of recreation, which ſometimes unavoidably occurred, and were looked for by us with a longing, that perſons, who have experienced the fatigues of ſervice, will readily excuſe, were ſubmitted to by him with a certain impatience, whenever they could not be employed in making further proviſion for the more effectual proſecution of his deſigns." (See King's Voyage, vol. iii. p. 48, 49.) Mr. Samwell has alſo annexed ſome particulars, relative to the life and character of captain Cook, to the "Narrative of his Death." Dr. Reinhold Forſter has alſo, with ſome abatement, paſſed an eulogium on his character, in his "Hiſtory of the Voyages and Diſcoveries made in the North." The following tribute to his memory, —the memory of "the ableſt and moſt renowned navigator this or any country hath produced," is drawn up by one of his own profeſſion, of whom it is ſaid, that he is not more diſtinguiſhed by the elevation of rank, than by the dignity of private virtues. (See Introduction to Cook's third Voyage, vol. i. p. 85—87, &c.) Captain James Cook, ſays this writer, "poſſeſſed, in an eminent degree, all the qualifications requiſite for his profeſſion and great undertakings; together with the amiable and worthy qualities of the beſt men. Cool and deliberate in judging; ſagacious in determining; active in executing; ſteady and perſevering in enterpriſing from vigilance and unremitting caution: unſubdued by labours, difficulties, and diſappointments: fertile in expedients: never wanting preſence of mind: always poſſeſſing himſelf, and the full uſe of a ſound underſtanding. Mild, juſt, but exact in diſcipline: he was a father to his people, who were attached to him from affection, and obedient from confidence. His knowledge, his experience, his ſagacity, rendered him ſo entirely maſter of his ſubject, that the greateſt obſtacles were ſurmounted, and the moſt dangerous navigations became eaſy, and almoſt ſafe, under his direction. He explored the ſouthern hemiſphere to a much higher latitude than had been ever reached, and with fewer accidents than frequently befal thoſe who navigate the coaſts of this iſland. By his benevolent and unabating attention to the welfare of his ſhip's company, he diſcovered and introduced a ſyſtem for the preſervation of the health of ſeamen in long voyages, which has proved wonderfully efficacious; for in his ſecond voyage round the world, which continued upwards of three years, he loſt only one man by diſtemper, of 118, of which his company conſiſted. The death of this eminent and valuable man was a loſs to mankind in general; and particularly to be deplored by every nation that reſpects uſeful accompliſhments, that honours ſcience, and loves the benevolent and amiable affections of the heart. It is ſtill more to be deplored by this country, which may juſtly boaſt of having produced a man hitherto unequalled for nautical talents; and that ſorrow is farther aggravated by the reflection, that his country was deprived of this ornament by the enmity of a people, from whom, indeed, it might have been dreaded, but, from whom it was not deſerved. For, actuated always by the moſt attentive care and tender compaſſion for the ſavages in general, this excellent man was ever aſſiduouſly endeavouring, by kind treatment, to diſſipate their fears and court their friendſhip; overlooking their thefts and treacheries, and frequently interpoſing, at the hazard of his life, to protect them from the ſudden reſentment of his own injured people. The object of his laſt miſſion was to diſcover and aſcertain the boundaries of Aſia and America, and to penetrate into the northern ocean by the N. E. Cape of Aſia.

Traveller! contemplate, admire, revere, and emulate this great maſter in his profeſſion; whoſe ſkill and labours have enlarged natural philoſophy; have extended nautical ſcience; and have diſcloſed the long unſealed and admirable arrangement of the Almighty, in the formation of this globe, and, at the ſame time, the arrogance of mortals, in preſuming to account, by their ſpeculations, for the laws by which he was pleaſed to create it. It is now diſcovered, beyond all doubt, that the ſame great being who created the univerſe by his *fiat*, by the ſame ordained our earth to keep a juſt poiſe, without a correſponding ſouthern continent—and it was ſo! "*He ſtretches out the north over the empty place, and hangeth the earth upon nothing.* Job. xxxvi. 7. If the arduous but exact reſearches of this extraordinary man have not diſcovered a new world, they have diſcovered ſeas unnavigated and unknown before. They have made us acquainted with iſlands, people, and productions, of which we had no conception. And if he has not been ſo fortunate as Americus to give his name to a continent, his pretenſions to ſuch a diſtinction remain unrivalled; and he will be revered, while there remains a page of his own modeſt account of his voyage, and as long as mariners and geographers ſhall be inſtructed, by his new map of the ſouthern hemiſphere, to trace the various courſes and diſcoveries he has made. If public ſervices merit public acknowledgments; if the man who adorned and raiſed the fame of his country, is deſerving of honour, then captain Cook deſerves to have a monument raiſed to his memory, by a generous and grateful nation.

Virtutis uberrimum alimentum eſt honos.

Val. Max. l. ii. c. 6.

From the numerous poetical tributes, paid to the memory of captain Cook, by our elegant female writers, we muſt confine ourſelves to a ſingle extract from Miſs Hannah More's poem on "Slavery."

"Had thoſe advent'rous ſpirits who explore
Thro' ocean's trackleſs waſtes, the far-ſought ſhore,
Whether of wealth inſatiate, or of power,
Conquerors who waſte, or ruffians who devour:
Had theſe poſſeſs'd, O Cook! thy gentle mind,
Thy love of arts, thy love of human-kind;
Had theſe purſu'd thy mild and liberal plan,
Discoverers had not been a curſe to man!
Then, bleſs'd Philanthropy! thy ſocial hands
Had link'd diſſever'd worlds in brother's bands;
Careleſs, if colour, or if clime divide;
Then lov'd, and loving, man had liv'd, and died."

Miſs Seward's admirable poem in celebration of captain Cook's memory would have furniſhed many pleaſing extracts, if our limits allowed our farther enlarging on this intereſting article; but we muſt refer the reader to this lady's elegy on the occaſion.

The Royal Society teſtified their reſpect for the memory of their illuſtrious member by medals, ſtruck on this occaſion, ſome of gold, others of ſilver, and others of bronze; the expence of which was defrayed by ſubſcription. On one ſide is the head of captain Cook in profile, and round it, Jac. Cook oceani investigator acerrimus; and on the exergue, Reg. Soc. Lond. Socio suo. On the reverſe is a repreſentation of Britannia, holding a globe; round her is inſcribed, Nil intentatum nostri liquere; and on the exergue, Auspiciis Georgii III.

Among the numerous teſtimonies of regard that have been rendered to the merits and memory of captain Cook, the important object of providing for his family hath not been forgotten. Soon after his death was known, the lords of the admiralty preſented a memorial to his majeſty; and he was pleaſed, by the advice of his privy council, to order a penſion of 200*l.* a year to be ſettled on the widow, and 25*l.* a year to each of the three ſons of the captain. A conſiderable benefit alſo redounded to his family from the ſale of the charts and plans, belonging to the voyage to the Pacific ocean, which were provided at the expence of government. On September the 3d, 1785, a coat of arms was granted to the family, with an appropriate device. Our navigator had ſix children. On the ſubject of this article ſee the firſt, ſecond, and third voyages of Cook; the firſt included in Hawkeſworth's Voyages, publiſhed in 3 vols. 4to, 1773. The ſecond, written by captain Cook himſelf, and publiſhed in 2 vols. 4to. in 1777, and the third publiſhed in 3 vols. 4to. in 1784; the two firſt being written by captain Cook, and the third by captain King. To the firſt of theſe volumes is prefixed an introduction by Dr. Douglas, the late biſhop of Saliſbury, containing a brief hiſtorical account of voyages that had been previouſly performed with a view to the objects comprehended by thoſe of captain Cook, a conciſe ſtatement of his diſcoveries, and a detail of the advantages reſulting from them. See alſo Kippis's Life of Captain Cook, and Biog. Brit. vol. iv.

Cook, *Captain* **Henry**, a choir-man, brought up in the chapel-royal during the reign of Charles I., which he quitted at the commencement of the grand rebellion, and went into the king's army, where he conſiderably diſtinguiſhed himſelf; and in 1642, obtained a captain's commiſſion. At the reſtoration, he was appointed maſter of the children of the chapel-royal. He compoſed the coronation anthem, according to Ant. Wood, for Charles II., and a hymn in four parts, compoſed by him, is likewiſe ſaid to have been performed inſtead of the litany, in the chapel of St. George at Windſor, by order of the ſovereign and knights of the garter, on the 17th of April 1661. None of his church muſic, however, was printed, nor has Dr. Tudway inſerted any of his compoſitions in the voluminous MS. Harleian collection of Engliſh ſervices and anthems. And, indeed, if we may judge of them by the few ſecular compoſitions which appear in the collections of the times, he was little fitted for the high office to which he was appointed at the reſtoration. In the ſecond part of Playford's "Muſical Companion," 1667, there are two or three of his ſongs which are dry, ill accented, and equally deſtitute of melody and maſterly harmony. However, he had the merit, or at leaſt the good fortune, to be the maſter of three boys among the children of the chapel, who gave very early teſtimony of their genius and progreſs in compoſition. Theſe were Pelham Humphrey, John Blow, and Michael Wiſe, who, even while they were choriſters in the chapel, produced verſe anthems, far ſuperior in melody and deſign to any that our church could boaſt, anterior to Purcell. Cook died in 1672, according to Ant. Wood, of grief, at being ſo far ſurpaſſed in compoſition by his young pupil, Pelham Humphrey.

Cook, *Dr.* **Benjamin**, an eminent organiſt and contrapuntiſt, in the ſtyle of our beſt eccleſiaſtical compoſers, whom he had ſtudied from Tallis, to Crofts, Weldon, and Green: a very correct harmoniſt and good organ player, but with limited powers of invention. He was organiſt of Weſtminſter Abbey, and on the death of Kelway elected organiſt of St. Martin's in the Fields. He long preſided at the Crown and Anchor concert, which was originally eſtabliſhed for the preſervation of the beſt works of the moſt eminent maſters of old times. It is a curious circumſtance, that at this concert of ancient muſic, Handel was regarded as an innovator, and Geminiani thought it an honour to be allowed to dedicate his laſt concertos to this ſociety. Dr. Pepuſch, who eſtabliſhed and directed this concert, to the time of his death, never allowed Handel any other merit than that of a good practical muſician. The irreconcileable enmity between the lovers of old and new muſic, became from the time of this inſtitution, as violent as the rage between the champions of ancient and modern learning. Dr. Cook, a ſteady votary of the old maſters, died September 1793. He was the ſon of Benjamin Cook, who kept a muſic ſhop in New-ſtreet, Covent Garden, and who publiſhed by patent, among other things, ſix concertos for violins, tenor and baſs, by Alexander Scarlatti; the chamber ſymphonies of Porpora, for three inſtruments; and the two books of leſſons by Domenico Scarlatti, in long 4to., of which Roſingrave was the editor. After the deceaſe of Cook, Johnſon reprinted Scarlatti's leſſons, with the ſame title page, and the ſame errors, as had eſcaped correction in the former edition.

Cook, Henry, a native of this country, born in 1642. Having a taſte for hiſtorical painting, he travelled to Italy for the purpoſe of improving himſelf in this branch of the art, and ſtudied under Salvator Roſa; but, on his return to England, met with ſo little encouragement, that for many years he remained in want and obſcurity. At length, however, his talents gained him notice, and he was employed by king William to repair his cartoons; he likewiſe finiſhed the equeſtrian portrait of Charles II. at Chelſea-college, painted the choir of New-college chapel Oxford, and the ſtaircaſe at Ranelagh houſe, beſides many other works mentioned by Mr. Walpole. He is alſo ſaid to have tried portrait painting, but to have given it up, diſguſted with the caprices of thoſe who ſat to him. He died 18th Nov. 1700. Walpole's Anecdotes.

Cook, in *Ichthyology*, a ſpecies of fiſh, which is ſometimes taken in great plenty on the coaſt of Cornwall. It is a ſcaly fiſh, and does not grow to any great ſize: the back is purple, the belly yellow, and the tail rounded.

Cook's *River*, in *Geography*, a river of North America, which runs into the northern Pacific ocean, between Cape Elizabeth and Point Banks, *i. e.* between E. long. 207° 9′, and 207° 45′; N. lat. 58° 42′, and 59° 10′; and which, by its various branches, opens a very conſiderable inland navigation. This name was given to the river by lord Sandwich, in honour of captain Cook, who, in the year 1778, traced it as high as the latitude of 61° 30′, and the longitude of 210°, or about 70 leagues from its entrance, without perceiving the leaſt appearance of its ſource. "It was a ſatisfaction to me," ſays this perſevering navigator, (Third Voyage, vol. ii. p. 397.) "to reflect, that, if I had not examined this very conſiderable inlet, it would have been aſſumed, by ſpeculative fabricators of geography, as a fact, that it communicated with the ſea to the north, or with Baffin's or Hudſon's bay to the eaſt; and been marked, perhaps, on future maps of the world, with greater preciſion, and more certain ſigns of reality than the inviſible, becauſe imaginary, ſtraits of de Fuca, and de Fonte." Mr. King was ordered to land on the northern point of the low land, on the S.E. ſide of the river, there to diſplay the flag, to take poſſeſſion of the country and river in the name of his Britiſh majeſty, and to bury in the ground a bottle, containing ſome pieces of Engliſh coin, of the year 1772, and a paper, on which were inſcribed the names of the ſhips and the date of the diſcovery. Near the ſhore Mr. King obſerved about twenty of the natives, who appeared with their arms extended, probably to expreſs their peaceable diſpoſition, and to ſhew that they were without weapons. When their alarm, occaſioned by the ſight of muſquets, had ſubſided, they allowed their new viſitants to approach them, and appeared to be cheerful and ſociable. Their ſpears and their other hoſtile weapons, as it was afterwards diſcovered, were hid in the buſhes cloſe behind them. The ground was ſwampy, and the ſoil poor, light, and black. It produced a few trees and ſhrubs, ſuch as pines, alders, birch, and willows; roſe and currant buſhes, and a little graſs, but not ſo much as a ſingle plant or flower was diſcovered. On a future day, ſeveral large and ſome ſmall canoes, with natives, came off to the Britiſh ſhips, and bartered their ſwine; after which, they ſold their garments, till many of them were quite naked. Among others, they brought a number of white hare or rabbit ſkins, and very beautiful reddiſh ones of foxes; but there were only two or three ſkins of otters. They alſo ſold pieces of ſalmon and halibut. They preferred iron to every thing elſe offered to them in exchange. The lip-ornaments did not ſeem ſo frequent among them as at Prince William's Sound; but they had more of thoſe which paſs through the noſe, and, in general, theſe were alſo much larger. They had, however, a greater quantity of a kind of white and red embroidered work on ſome parts of their garments, and on other things, ſuch as their quivers and knife-caſes. On the weſt ſide, a volcano was diſcovered, in lat 60° 23′; and this is the firſt high mountain N. of mount St. Auguſtine. The volcano is on that ſide of it next the river, and not far from the ſummit. It only emitted a white ſmoke without fire. Captain Cook obſerves, that all the people met with near this river, ſeemed, by every ſtriking token of reſemblance, to be of the ſame nation with thoſe who inhabit Prince William's Sound, but eſſentially differing from thoſe of Nootka, or King George's Sound, both in their perſons and language. The language of theſe is rather more guttural; but, like the others, they ſpeak ſtrongly and diſtinctly in words which ſeem to be ſentences. Theſe people are in poſſeſſion of iron; that is, the points of their ſpears and their knives are of this metal, and ſome of the former are alſo made of copper. Their ſpears are like our ſpontoons; and their knives, which they keep in ſheaths, are of a conſiderable length. Theſe, with a few glaſs beads, were the only things ſeen among them that were not of their own manufacture.

Their beads and iron they muſt have received from ſome civilized nation; and it ſeems moſt probable, that they procured them through the intervention of the more inland tribes from Hudſon's Bay, or the ſettlements on the Canadian lakes; unleſs it can be ſuppoſed (which, however, is leſs likely) that the Ruſſian traders from Kamtſchatka, have already extended their traffic ſo far; or at leaſt that the natives of their moſt eaſterly Fox iſlands, communicate along the coaſt, with thoſe of *Prince William's Sound*; which ſee. The Ruſſians themſelves, ſays captain Cook, have never been among them; for if that had been the caſe, we ſhould hardly have found them clothed in ſuch valuable ſkins as thoſe of the ſea-otter. There is not the leaſt doubt, continues captain Cook, that a very beneficial fur trade might be carried on with the inhabitants of this vaſt coaſt. But unleſs a northern paſſage ſhould be found practicable, it ſeems rather too remote for Great Britain to receive any emolument from it. It muſt, however, be obſerved, that the moſt valuable, or the only valuable, ſkins which Cook ſaw on the weſt ſide of America, were thoſe of the ſea-otter. All their other ſkins ſeemed to be of an inferior quality, particularly thoſe of their foxes and martins. Moſt of the ſkins that are fitteſt for ſale, are thoſe which are made up for outer garments, and this is the chief uſe for which they kill the animals. By increaſing intercourſe with purchaſers, they would be more aſſiduous in procuring ſkins, and thus a plentiful ſupply might be obtained in this country.

In Cook's river, the tide is very conſiderable, and much contributes to facilitate the navigation of it. It is high water in the ſtream, on the days of the new and full moon, between two and three o'clock; and the tide riſes perpendicularly, between three and four fathoms. The reaſon of the tides being greater here than at other parts of this coaſt, is, that, the mouth of the river being ſituated in a corner of the coaſt, the flood from the ocean is forced into it by both ſhores, and thus ſwells the tide to a great height. The variation of the compaſs was 25° 40′ E.

Cook-*room*, in a *Ship*, is where the cook and his mate dreſs and deliver out the meat, &c.

Cook's *Strait*, in *Geography*, ſo called from its diſcoverer captain Cook, a ſtrait which ſeparates the two iſlands that form New Zealand. This ſtrait is about four or five leagues broad; and the iſlands, thus divided, are ſituated between the latitudes of 34° and 48° S.; and between the longitudes of 181° and 194° W. See New Zealand.

COOKE, *Sir* Anthony, in *Biography*, governor, preceptor, or ſchoolmaſter, to king Edward VI., and great grandſon to ſir Thomas Cooke, lord-mayor of London in 1462, was born at Giddy-hall in Eſſex about the year 1506, and educated, probably, at Cambridge. He became eminent in literature and the arts, being a thorough maſter of the Latin and Greek languages, an excellent critic and philologiſt, and equally ſkilled in poetry, hiſtory, and the mathematics. He was no leſs diſtinguiſhed for his piety and goodneſs. Theſe qualities recommended him to the office of inſtructor to king Edward VI., and the royal pupil is well known to have done honour to the talents and character of his preceptor. During queen Mary's reign he was an exile for religion; but upon the acceſſion of queen Elizabeth he returned to his native country, fixing his reſidence at Giddy-hall, the building of which he completed. He died June 11, 1576, having attained the age of 70 years, and was buried in the chapel of Rumford in Eſſex, where a monument was erected to his memory. He left four daughters, eminently learned in the Greek and Latin languages; *viz.* Mildred, married to ſir William Cecil, baron Burleigh, lord-treaſurer of England; Anne, wife of ſir Nicholas Bacon, lord keeper of the great ſeal; Elizabeth, married to John, lord Ruſſel, ſon and heir of Francis earl of Bedford; and Catherine, wife of Henry Killigrew, eſq. He had alſo two ſons.

COOKERY *of Meats*, in *Domeſtic Economy*, denotes the application of heat to the ſeveral aliments taken both from vegetables and animals. The advantages attending the application of heat to vegetable aliments are ſuch as follow: 1. That the greateſt part of vegetable ſubſtances are thus rendered more ſoluble in the human ſtomach. The only doubt, ſays Dr. Cullen, that can ariſe with regard to this, reſpects vegetables to which in their crude ſtate a boiling heat is immediately applied, ſo that in many of them a coagulation is produced; in conſequence of which they ſeem to be rendered leſs ſoluble in water than they were before:—but this, he ſays, does not ſeem to have any effect on their ſolution in the ſtomach. Whether the difficult ſolution be obviated by ſome degree of fermentation that neceſſarily takes place in the ſtomach, or by the powers of the gaſtric fluid, it is not neceſſary to determine, as it is certain that the action of heat ſeparates in ſome meaſure the ſmall particles of bodies, and thereby renders them more readily ſeparable by the ſolvent powers of the ſtomach. 2. The application of heat ſeparates and diſſipates the volatile parts of vegetable ſubſtances, which are ſeldom of a nutritious nature, and, in many caſes, have a tendency to prove noxious. 3. The application of heat to a certain degree extricates and diſſipates a conſiderable quantity of air, which, in the natural ſtate of vegetables, is always fixed in their ſubſtance; and it is probably, in this way eſpecially, that heat beſt contributes to the dividing and looſening of the coheſion of the ſmall parts of vegetable ſubſtances. It is certainly in this way, by diſſipating a large portion of their air, that vegetables are rendered leſs liable to fermentation, and leſs liable to produce that flatulence, which is occaſionally ſo troubleſome in the ſtomach and inteſtines. Dr. Cullen obſerves further, that, as the heat may be employed in two ways, either in a humid or a dry form; the former is always better ſuited than the latter to all the purpoſes above-mentioned. The cookery of animal ſubſtances alſo conſiſts chiefly in the application of heat. Other practices, however, previous to cookery, may be conſidered as parts of it; particularly ſalting, drying, and pickling. Theſe practices, however, are merely uſeful for the purpoſes of domeſtic economy, as preſerving meat from putrefaction, before it be ſubjected to heat, for a longer time than it could be preſerved without ſuch means. Theſe practices, Dr. Cullen thinks, can never increaſe the nutritious quality of meat, or render it even of more eaſy digeſtion. Drying certainly brings the ſolid parts of meat more cloſely together, which muſt render it of more difficult ſolution. The addition of ſalt, which ſtimulates the ſtomach, may ſeem in ſome caſes to promote digeſtion; but this muſt be when the ſalt is added in ſmall quantity, and when the meats preſerved by it are taken in moderate quantity only. For when meats have been long ſalted they are hardened, and rendered in proportion leſs ſoluble in the ſtomach: and a large quantity of ſalt accompanying them is certainly hurtful to the ſyſtem. There is one preparation of animal food, which is made without any addition; and that is by its being kept for ſome time before it is ſubjected to cookery, for a longer or ſhorter interval, according to the ſeaſons, and the nature of the meat; but always till it has made ſome advance towards putrefaction. The tendency to this ſeems to take place from the moment that life is extinguiſhed in the animal; and the allowing of it to take place to a certain degree renders the meat more eaſy of ſolution in the ſtomach; and if the putreſcency be only in a moderate degree, it does not ſeem to injure the nutritious quality of the meat. The proper degree of putreſcence is not eaſily aſcertained; and it is certainly different according to the conſtitution of the perſon. Some can uſe meats tainted in a conſiderable degree without inconvenience: whilſt the digeſtion of others is much diſturbed by the ſmalleſt quantity of putreſcent meat. Every advance in meats towards putreſcency, renders them, as Dr. Cullen ſays, more ready to increaſe the tendency of the animal fluids to that ſtate which we take to be always hurtful to the human conſtitution, as it both favours the acceſs of diſeaſes, and aggravates their ſymptoms and danger when they occur.

The cookery of animal ſubſtances by the application of heat is of two kinds, as it is applied in a humid form by *boiling* and *ſtewing*, or in a dry form, by *roaſting*, *broiling*, and *baking*. For the proceſſes and effects of boiling and ſtewing; ſee Boiling. The application of heat in a dry form is of two kinds, as it is in cloſe veſſels, or as it is expoſed to the free air. The firſt is *baking*; and though commonly in this practice the cover of the meat is merely paſte, any conſiderable exhalation is prevented, and the retention of the juices under the application of heat renders the meat more tender; and in all caſes when the heat applied looſens, and, in ſome meaſure, extricates the air, without exhaling it, the ſubſtance is rendered more tender than when with any other application an exhalation is allowed. In *broiling* an exhalation takes place; but as the heat of a naked fire is more nearly applied, the outer ſurface is in a degree hardened before the heat penetrates the whole, and thus a great exhalation is prevented, while the whole is rendered ſufficiently tender; but this kind of cookery is eſpecially ſuited to meats that are choſen to be eaten a little raw. *Frying* is a-kin to this; but as in this caſe the meat is cut into thin ſlices, and laid in a veſſel which is interpoſed between the meat and the naked fire, the heat is more equally applied to the whole ſubſtance. But as the part of the meat lying next to the bottom of the veſſel would be ſuddenly hardened by the heat, it is always neceſſary to interpoſe ſome fluid matter. When this, as is moſt commonly the caſe, is of an oily matter, a ſtrong heat is apt to render it empyreumatic, or at leaſt leſs miſcible with the fluids of the ſtomach; and, therefore, all fried meats are leſs eaſily digeſted than thoſe of any other preparation, except that ſometimes the ſame may happen to baked meats, to which an oily matter, and that only, is added to avoid the too drying heat. By *roaſting* the heat may be ſo managed as to be equally applied, and therefore its effect in rendering the meat more tender is certainly obtained; and though a conſiderable exhalation is made, it is almoſt only of a watery humidity. This, indeed, would take place to a very great degree, and render the meat again more inſoluble, were it not that large maſſes only are ſubjected to this operation, and that thereby the outer ſurface is firſt condenſed, and prevents the exhalation from the interior parts. At the ſame time, an oily matter is commonly and repeatedly applied to the outer ſurface, which prevents both much exhalation, and any great hardening of the outer ſurface, till the heat has penetrated the whole, and rendered it ſufficiently tender. Cullen's Mat. Med. vol. i. pt. i. c. 2.

COOK-HOUSE, in *Geography*, a town of America, ſituated on the Cooquago branch of Delaware river, in the townſhip of Colcheſter, New-York, 18 miles S. of the mouth of Unadilla river.

COOKIA, in *Botany*, (named by Sonnerat, in honour of our illuſtrious circumnavigator, captain Cook.) Willd. 844. Juſſ. 261. Vent. 3. 155. Sonnerat It. 2. 181. tab. 80. Retz. Obſ. 62. Jacq. Hort. Schoenb. 1. 53. tab. 101. (Quinaria Lanſium; Lour. —. Wampi of the Chineſe.)

Gen. Ch. *Cal.* very ſmall, five-cleft. *Cor.* Petals five, ſpreading. *Stam.* Filaments ten, diſtinct; anthers roundiſh. *Piſt.* Germ ſomewhat pedicelled, hirſute; ſtyle one; ſtigma capitate. *Peric.* Berry; Juſſ. (Pome; Willd.) five-celled; three frequently abortive. *Seeds* one in each cell.

Eſſ. Ch. Calyx five-cleft, inferior. Petals five, equal, inferior. Berry or pome, five-celled. Seeds one in each cell.

Sp. Cookia *punctata*. A tree. *Trunk* browniſh, ſtriated, rugged. *Branches*, petioles and common peduncles rough, with prominent points. *Leaves* alternate, petioled, unequally pinnated; leaflets petioled, alternate, egg-ſhaped, acuminate, quite entire, ſmooth, ſprinkled with pellucid dots, inner ſide narrower. *Flowers* white, in a large divaricated terminal panicle. A native of China and of the South Sea iſlands.

COOLER, among *Brewers*, *Diſtillers*, &c. a large veſſel, uſually of ſmall depth and large ſurface, in which liquors are cooled, after having been boiled.

COOLIES, in the Eaſt Indies, are thoſe natives who are employed in carrying of burthens, digging of trenches, and ſuch laborious occupations; and who, ſupplying the place of pioneers, cannot be diſpenſed with in the operations of military tactics in Hindooſtan.

COOLING is the progreſſive decreaſe of temperature from a higher to a lower degree. From the higheſt degree of heat, which human induſtry has been able to obtain by means of combuſtion, or by concentrating the ſolar rays, to the loweſt degree of it, which both natural and artificial methods have produced, the ſcale is very conſiderable; and different parts of it have obtained diverſe denominations, which are derived from the moſt ſtriking phenomena that take place at particular points of the ſcale; thus we hear of porcelain heat, white heat, red heat, boiling heat, temperate, freezing, &c. and all theſe tranſitions from the firſt to the laſt, fall under the denomination of *cooling*; whereas the contrary tranſition from the loweſt to the higheſt, is called *heating*. In order to preſerve perſpicuity, and to aſſign to each of the received denominations, the particulars which belong more immediately to it, we have divided the ſubject into three articles, under the words *congelation*, *cooling*, and *freezing*. Under the firſt we have ſtated the phenomena of natural congelation; the laſt contains whatever relates to artificial freezing, *viz.* to the production of cold below 32° of Fahrenheit's ſcale; and under the preſent, we ſhall principally ſtate all the methods and the effects of cooling from the actual temperature of the atmoſphere to a lower degree; but not below that of melting ice, *viz.* 32°, which is commonly called the freezing point.

The temperature of the atmoſphere in the hotteſt climates, has hardly ever been known to exceed 130°, and it is but ſeldom that it reaches that moſt oppreſſive degree of heat. In the human ſpecies, nature has made ample proviſion, and has furniſhed them with induſtry ſufficient for counteracting the effects of a very high or a very low temperature; but without any artificial aſſiſtance, few are the degrees of heat in which human beings can live with perfect comfort. Making ſome allowance for the natives of different climates, the whole range temperature may be ſaid to reach from the 60th to the 70th degree of Fahrenheit's ſcale. Below 60° moſt perſons have no objection to a gentle fire in their apartments; and above 70° they generally complain of heat. Yet when the natural temperature of the atmoſphere is above 50°, cooled liquors are generally preferred for drink; but when the temperature is above 70°; then not only cooled liquors, but cool apartments alſo, are articles of great luxury; and (it may in great meaſure be ſaid) of neceſſity. The languor which is commonly induced by heat, is in great meaſure relieved by artificial cooling. Patients affected with fevers of the intermittent and putrid kinds, which are ſo very common and deſtructive in hot climates, receive great benefit from the uſe of cooled liquors, and ſuch are plentifully adminiſtered to them, whenever they can be obtained. The preſervation likewiſe, of meats, fruit, butter, &c. in warm climates, or in the hot ſeaſon, is conſiderably aſſiſted by cooling; and it may be extended to a very remarkable long period by actual freezing.

In order to anſwer all theſe purpoſes, mankind has, from time immemorial, endeavoured to diſcover and to apply methods

thods of cooling, or of refrigeration. Theſe methods, as far as they are at preſent known, may be compriſed under the following heads; *viz.* 1ſt, the application of ſomething naturally colder than the actual temperature of the atmoſphere; 2dly, ventilation; 3dly, evaporation; and 4thly, the ſolution of certain ſaline ſubſtances. Sometimes two or three of theſe means are applied at the ſame time, to the article which is required to be cooled. In every country of Europe, and eſpecially in the ſouthern part of it, ice is collected during the winter, in proper places, and is uſed for cooling liquors, &c. in the ſummer ſeaſon, or throughout the whole year. And this undoubtedly is the moſt eaſy, the moſt extenſive, and the moſt effectual method of cooling. A little ice taken out of the ice-houſe, and placed round a bottle of water or wine, in any convenient veſſel, ſoon cools it to the deſired degree; and if the effect is to be increaſed, ſo as to freeze creams, fruit, &c. by breaking the ice into ſmall pieces, and mixing common ſalt with it, the deſired end will be obtained. The ice-houſe itſelf is of very eſſential uſe for preſerving meat, fiſh, butter, fruit, &c. which things need only be laid in it, until they are wanted.

When ice cannot be eaſily procured, well water forms a uſeful ſubſtitute to a certain degree. When the depth of the well is 40 or 50 feet, or upwards, the conſtant temperature of its water is very nearly equal to the mean temperature of the country, which, of courſe, is lower than the uſual temperature of the ſummer ſeaſon in that country; hence, if a pail of water be drawn, and a bottle of wine, or other liquor, be immediately placed in it; a conſiderable refrigeration may be obtained, and it may be maintained by drawing freſh water at intervals from the well, &c. Thus in London the mean temperature is about 50°, and ſo is the temperature of pretty deep wells throughout the year. Now in the ſummer ſeaſon, the temperature frequently riſes above 65°, or 70°; therefore, at thoſe times, by applying freſh-drawn well-water, the liquors we drink may be cooled about 15 or 20 degrees, which will render them incomparably more pleaſant. When articles of food are required to be kept ſome time longer than the heat of the weather would allow, they may be placed in a baſket at the end of a rope, and may be let down into the well, until they come within a foot or two of the water. For the like purpoſes, pretty deep pits, caves, or grottos may be uſed; ſince their temperature is nearly equal to the mean temperature of the country, and ſuffers little or no variation between winter and ſummer.

Ventilation is nothing more than a conſtant change of air; but if the air which has juſt paſſed by a body, and that which ſucceeds it are all of the ſame temperature, no cooling will be produced by the ventilation; but the refrigeration will take place, when the body is hotter than the air which paſſes by it, or when an increaſe of evaporation enſues. Expoſe a thermometer to the open air, but ſhelter it from the wind, and when the thermometer is become ſtationary, let the wind fall upon it; and it will be found that the quickſilver is not lowered in it. But when a human being, or other animal is expoſed to ventilation, the quick tranſition of air cools it; firſt, becauſe it continually removes the air which has been heated by the contact of the animal body, the breath, &c.; and ſecondly, becauſe the evaporation from the body is increaſed by the ventilation. So that, upon the whole, the uſe of ventilation, ſuch as is effected by means of fans, bellows, a particular diſpoſition of apartments, and other machines, is to remove heated or vitiated air from the vicinity of human beings, from cloſe habitations, priſons, ſhips, &c. The ingenious Dr. Hales fixed a machine of this ſort in the old Newgate priſon, which, being put in action by means of ſails, like a wind-mill, conſtantly ventilated the inſide of that priſon; and this machine remained in uſe until the rebuilding of that priſon upon a better plan rendered it ſuperfluous. See VENTILATOR.

Hitherto we have ſuppoſed, that the air is colder than the human beings who are expoſed to it; but ſhould the contrary be the caſe, then ventilation will produce a different effect; *viz.* it will heat, inſtead of cooling, as may be eaſily conceived by conſidering what has been ſaid above. And ſuch is the caſe with the hot winds, which ſometimes blow in Arabia, Africa, India, and other places.

One of the moſt uſeful and efficacious modes of cooling, eſpecially in thoſe countries where it may be moſtly wanted, is performed by means of evaporation. The principle upon which the cooling power of evaporation depends, is, that whenever a body is expanded, *viz.* its volume is increaſed, its capacity for containing heat is increaſed at the ſame time; hence the expanding body abſorbs the heat of the ſurrounding bodies, which, of courſe, are cooled by it.—A ſhort experimental illuſtration of this theory will eaſily explain the effect we are treating of. Take three common mercurial thermometers: keep one in its natural ſtate; place the ſecond in a bottle of water, and cloſe its aperture; wrap ſome cotton moiſtened with water round the bulb of the third; then expoſe all the three thermometers thus prepared to the ambient air, eſpecially when the wind blows in the ſummer ſeaſon; and after a few minutes obſerve their progreſs. It will be found that the naked thermometer, and that which ſtands in the bottle, indicate the ſame degree of temperature; but the third thermometer, which is wrapped in moiſtened cotton, will be found to indicate a temperature lower by a few degrees, than the former. The effect in this experiment is produced by the evaporation of the water from the cotton, and not from the water as water; for if that were the caſe, the thermometer in the bottle of water would likewiſe be cooled like the one involved in moiſtened cotton. Evaporation is the converſion of water into ſteam, or vapour; and the bulk of ſteam has been found to be many hundred times larger than the bulk of the water from which it originated. Now in that expanded ſtate, ſteam is capable of holding a vaſt deal more of the element of heat, than in its form of water, and that without manifeſting any higher degree of temperature. Or, in other words, if a thermometer be placed in a bottle full of vapour of water, and another thermometer be placed in the water from which that vapour was juſt produced, their temperatures will be found to be nearly the ſame; yet the vapour contains a vaſt deal more of the element of heat than an equal weight of water, which quantity of heat is eſſentially neceſſary for maintaining its elaſtic or vapourous exiſtence; and this is proved by obſerving, that vapour cannot be converted into water without depoſiting its heat upon (and of courſe elevating the temperature of) the ſurrounding bodies; and on the other hand, that water cannot be converted into vapour, without abſorbing heat from (and conſequently cooling) the ſurrounding bodies. Mr. Watt of Birmingham ſays, that he has obſerved as exact a coincidence between the heat rendered latent in the vapour, and that which emerges from it, as can be deſired; and that the heat obtainable from ſteam, capable of ſuſtaining the ordinary preſſure of the atmoſphere, is not leſs than 900°; and that it does not exceed 950° of Fahrenheit's ſcale.

The cooling action of evaporation is counteracted by the influx of heat from the ſurrounding bodies, ſince heat always tends to equalize the temperature of contiguous bodies. Thus in the above deſcribed experiment, the heat of the ſurrounding air tends to elevate the temperature of the thermometer, at the ſame time that the evaporation from the cotton tends to lower it. And according as the one or the other of theſe oppoſite actions predominates, ſo the cooling effect is more or leſs conſpicuous. From theſe obſervations it naturally follows, that the cooling, occaſioned by evaporation, is greater when the evaporation is quicker, and contrarywiſe; alſo, that when different fluids are uſed for the evaporation, in ſimilar circumſtances, that fluid which evaporates quickeſt, produces the greateſt refrigeration. Mr. Cavallo ſays, "in order to try the degree of refrigeration produced by the evaporation of different fluids, I held up a naked thermometer, (*viz.* a thermometer, the bulb of which was not in contact with the metal of the ſcale) and poured upon its bulb a ſtream of ſome particular fluid, which iſſued out of the capillary aperture of a tube; taking care to throw juſt fluid enough to ſupply the waſte by evaporation. By this means, when the temperature of the air was 64°, I found that the evaporation of water cooled the thermometer 8°; *viz.* brought it down to 56°; the evaporation of ſpirit of wine cooled it 16°; *viz.* brought it down to 48°; and the evaporation of ether cooled it 54°; *viz.* brought it down to 10°. But, by the uſe of the beſt purified ſulphuric ether, when the temperature of the air was about 56°, I brought the thermometer down to 3°. The cooling produced by the evaporation of other fluids needs not be mentioned; their effect being generally intermediate between the effect of water, and that of ſpirit of wine." (Phil. Tranſ. vol. lxxi.) Whatever promotes the evaporation, ſuch as a dry air, and eſpecially a dry wind, tends to increaſe the refrigeration; and when all the favourable circumſtances concur, the effect is prodigious; ſo that in a dry, warm, and briſk wind, by means of the evaporation of the beſt ſulphuric ether, the temperature of any kind of bodies may be lowered many degrees below the freezing point; and animals might be eaſily frozen to death.

Though ſeveral of the above-mentioned particulars, and eſpecially the cauſes upon which they depend, have been but lately inveſtigated and aſcertained; yet the cooling effect of evaporation has been known and uſed by mankind from time immemorial. Athenæus ſays, as being related by Protagorides of Cyzicum, that in the time of king Antiochus, it was uſual to cool water by evaporation, and to drink it as a luxury. A very eaſy and familiar experiment to ſhew the effect of evaporation, may be performed in the following manner. Moiſten a ſmall ſpace on the upper part of each hand; cover one of thoſe places with an inverted wine glaſs, and let a perſon blow with a pair of bellows upon the other hand. The latter will be ſenſibly cooled, but not the former. Change the glaſs and the blowing, from one hand to the other, and the effects will be reverſed. Seamen, eſpecially in the night time, frequently employ this natural effect for diſcovering which way the wind blows. They moiſten a finger of their hands by putting it in their mouth; then expoſe it to the ambient air by elevating it above their head; and juſtly conclude that the wind blows from that quarter which is oppoſed to the moſt cooled ſide of the finger.

In warm climates, where the dryneſs of the air generally is very great, the refrigeration ariſing from evaporation is very conſiderable, and is of courſe frequently employed for counteracting the natural heat. The caravans which traverſe the parched deſerts of Arabia, are obliged to carry their ſupply of water in earthen jars upon camels; but in order to keep it pleaſantly cool, the jars are involved in cloths, which they take care to keep continually moiſtened with water. It is a pretty common practice in the ſouthern parts of Europe, as well as in the Eaſt and Weſt Indies, in America, &c. to wrap up a bottle of wine, or water, or other liquor, in a wet cloth, and thus to ſuſpend it in a ſhady place, either under a tree or in a paſſage, ſo as to expoſe it to the briſkeſt current of air that can be obtained; for by this means the liquor will be cooled ſeveral degrees; care, however, muſt be had to ſprinkle more water upon the cloth, which ſurrounds the bottle, in proportion as the former evaporates. Mr. Walker, of Oxford, deſcribes a peculiar method of producing a very conſiderable degree of cold by means of evaporation. "Having," he ſays, "in the courſe of the preceding winter, frequently ſucceeded in producing ice, by the cold produced from evaporation with water, when the temperature of the air was 38°; it occurred to me, that it might be poſſible to freeze water in the middle of ſummer, by a proceſs which depended on this principle, by the uſe of water only. Accordingly, I procured a tall cylindrical veſſel, holding about two gallons, in which is fixed a ſmall ſpiral tube, as in the worm-tub of a common ſtill; the lower end of this tube comes out through the veſſel near the bottom, ſufficient to connect the noſle of a pair of bellows to it, by the intervention of a bladder, ſecured air-tight; this ſpiral tube ends at the top of the cylindrical veſſel, where it is ſomewhat enlarged, like the mouth of a funnel. This veſſel, being covered with flannel, was filled with water and hung out in a briſk dry wind, the temperature of the air being 50°; after ſome time, by repeatedly wetting the flannel on the outſide of the veſſel, I found the water within was cooled to 40°; air being then forced through the tube (by means of the bellows), ſurrounded by the cooled water, came out at the upper extremity of the tube at nearly the ſame temperature.

"A thermometer having its bulb covered with lint, and wetted repeatedly with the cold water in the veſſel, placed ſo as to receive the draught of cold air from the tube, ſoon ſunk to 34°; hence by a ſeries of two or three of theſe veſſels, water might, upon this principle, be frozen at midſummer, recollecting that this experiment may always commence at 50°, the uſual temperature of ſprings; and hence it might be poſſible upon the ſame principle, to cauſe nature upon a ſmall ſcale, even without the immediate interpoſition of art, to depart from her uſual courſe, and to aſſume the hoary garb of winter at midſummer.

"For this purpoſe a current from the external air might be admitted into the tube, by means of a funnel, communicating with, and receiving, a conſtant draught of air.

"In an attempt of this kind, it would be neceſſary (beſides ſome other variation in the veſſels, which circumſtances might point out,) that the cylindrical veſſels be porous, or pierced with ſmall holes; ſo that the water may be conſtantly and gently oozing out."

In Spain, in Italy, in Egypt, and probably in other places, certain veſſels are made of a porous earth, which, when full of water, will juſt permit ſome of that fluid to ooze out on their external ſurface, whence it evaporates, and thus cools the remainder of the liquor within the veſſel. The Spaniſh veſſels for this purpoſe conſiſt of a reddiſh brown earth. They are pretty broad, but not very capacious. In Italy they have been made of a pale yellowiſh material, but much larger. In Egypt they are made ſomewhat in the ſhape of a Florence flaſk, and not much bigger; but their aperture ſpreads out in the form of a cone, or rather of an ale glaſs, which is done for the conveniency of drinking out of it. Their ſubſtance is of the colour of aſhes, and it is ſaid to be a ſcum left on the banks of rivers. But veſſels of any degree of poroſity may be made by mixing ſand and clay in various proportions.

The uſe of theſe veſſels in Spain, in Italy, and eſpecially in Egypt, is attended with a notable degree of refrigeration, on account of the great dryneſs of the air in thoſe climates, which enables it to abſorb a great deal of moiſture in a ſhort time; but the ſame veſſels having been brought over, and having been tried, in this country, have been found to cool the contained liquor in a very trifling degree; evidently owing to the ſtate of the air in this country, which is much leſs hot, and much leſs dry than in the above-mentioned places; therefore much leſs apt to promote evaporation. One of the Egyptian veſſels was tried in London at a time when the temperature of the atmoſphere was at a mean, and after about half an hour, when almoſt three quarters of the water had paſſed through it, and had dropped down, the remaining quantity of water was found barely 3° colder than the ſurrounding air.

It is but lately that liquor coolers have been manufactured in this country, and they are at preſent to be found in moſt of the earthenware ſhops in and about London. Theſe are cylindrical veſſels, about ſix inches in diameter, and about a foot high. It is directed to keep one of theſe veſſels entirely immerged in water during one hour. The veſſel, being then removed, in that moiſt ſtate, without putting any water in it, a bottle of wine, &c. muſt be placed in it, and this is ſaid to be cooled by the evaporation of that quantity of water, which the ſubſtance of the veſſel had imbibed whilſt it remained under water. Upon trial, however, it appears that the actual refrigeration which is obtained by means of one of theſe veſſels, ſeldom amounts to two or three degrees; and that, of courſe, a bottle of wine may be cooled much more effectually by placing it into a pail of water freſh drawn from a pretty deep well or pump; which may be renewed at intervals. Indeed, conſidering the form of theſe coolers, alſo that the ſides of it are at a conſiderable diſtance from the ſurface of the bottle, and the ambient air has a free acceſs to both, it is hardly to be expected that any ſenſible advantage ſhould be obtained from them.

In India the action of evaporation is uſed not only for cooling liquors, but likewiſe for cooling apartments, and the effect, by the teſtimony of thoſe perſons who have experienced it, is ſaid to be very remarkable. The method, (which, however, is practicable only when a dry wind blows,) is as follows. That door of the apartment which is oppoſed to the wind, and through which the wind enters, is ſtopped up with a peculiar ſort of ſcreen or curtain, which fits it exactly. This ſcreen conſiſts of two ſurfaces or gratings of bamboo, ſituated parallel to each other, and about three or four inches apart; then the ſpace between theſe external ſurfaces is filled up in a looſe manner with the roots of a ſweet-ſcented graſs. In ſhort the conſtruction of this ſcreen is calculated to admit the air not in a body, but divided through a vaſt number of paſſages. Two men are placed on the outſide, each having a goat's ſkin filled with water, which they keep continually ſprinkling upon the ſcreen. A conſtant and copious evaporation is of courſe kept up, which preſently cools the adjoining room to a very remarkable degree. By this means the temperature of the room has ſometimes been lowered upwards of 15°.

Amongſt thoſe cooling proceſſes which depend upon the expanſion of bodies, that which ariſes from the expanſion of air muſt not be forgotten; but as this is by no means very practicable, we ſhall barely mention it in this place. The condenſation and expanſion of air produce the effects which have been mentioned above; *viz.* the former is attended with an extrication of heat, and the latter with an abſorption of it; hence the contiguous bodies are heated by the former, and are cooled by the latter. When air is ſuddenly condenſed, (ſee Condenser, and Condensation,) the heat which is extricated from it, has been found capable of ſetting fire to light combuſtible bodies; and when the air is rarefied either by means of an air-pump, or by liberating it from a veſſel, in which it has been condenſed; the cold it produces has ſometimes been found to lower the thermometer ſeveral degrees below the freezing point.

The laſt method of cooling which remains to be deſcribed, is obtained by the ſolution of ſalts. That certain ſaline ſubſtances, whilſt diſſolving in water, or in acids, would generate a conſiderable degree of refrigeration, and eſpecially that the ſolution of ſalt ammoniac would lower the thermometer down to the freezing point, has been long known; but, within theſe 15 or 20 years, the ſubject has received wonderful improvements, in conſequence of the experiments inſtituted by various ingenious perſons; and eſpecially from the aſſiduous inveſtigations, and ſucceſsful experiments of Mr. Walker of Oxford, who has examined the cooling powers of a vaſt number of ſaline ſubſtances both ſingle and mixed; and has been able to freeze quickſilver at Oxford in the middle of ſummer, merely by the ſolution of ſalts. His intereſting experiments, and his various freezing mixtures, will be found deſcribed under the article Freezing.

A vaſt number of ſalts and ſaline mixtures may be uſed for cooling liquors; but the moſt advantageous are thoſe which, after ſolution, may be recovered by means of evaporation, ſo as to render them uſeful for a ſecond refrigeration, a third, and ſo forth. Yet the price of moſt of thoſe ſalts in Europe, the trouble of recovering them from the ſolution, and pounding them in order to render them fit for another cooling operation, have not rendered this method common in this part of the world; eſpecially where other eaſier methods are practicable. So that in fact the cooling power of ſaline ſolutions is moſtly uſed for particular experiments by the European philoſophers, eſpecially when a very powerful freezing mixture is required. In India, where nitre is very cheap, and the heat of the climate prompts the inhabitants eagerly to adopt every poſſible method of cooling, the practice of cooling liquors, by means of the ſolution of nitre in water, is very common. For this purpoſe, the wine, the water, or any other liquor, is put into a metallic bottle, generally a pewter one, having a pretty long neck. A tub is partly filled with water, and a quantity of nitre is thrown in it; then the operator holds the bottle by the upper end of its long neck, and gently moves it about the ſaline ſolution, and thus cools the liquor in it to a very conſiderable degree. As ſalts will produce cold only during their ſolution, therefore when the firſt quantity of nitre has been thoroughly diſſolved in the above proceſs, more nitre muſt be added; and when the water is completely ſaturated, ſo as not to be capable of diſſolving more ſalt, then the bottle muſt be removed to another tub with a freſh ſaline mixture. The nitre might afterwards be eaſily recovered merely by expoſing the ſolution, in ſhallow pans, to the hot rays of the ſun in that country; this economical plan, however, does not as yet ſeem to have been adopted.

The ſalts which might be uſed for the purpoſe of cooling liquors in this country, or in long voyages, are nitre and ſalt ammoniac; the other ſaline ſubſtances being either more expenſive or not eaſily recoverable after ſolution. Of the effects of nitre alone in water enough may be derived from the above deſcribed proceſs. Salt ammoniac by itſelf gradually added to a quantity of water, will occaſion a conſiderable refrigeration, ſo that a bottle of wine, &c. placed in the ſolution may be cooled even to 32° of Fahrenheit's ſcale. But a mixture of both ſalts is much more efficacious, and the beſt proportion is five parts of nitre, five of ſalt ammoniac, and 16 of water. During the ſolution, which will continue a conſiderable time, this mixture will cool the thermometer ſeveral degrees below the freezing point; but it muſt not be imagined that a ſmall quantity of the ſame will cool a bottle of wine to an equal degree. The ſolution of a given quantity of the mixture abſorbs a certain quantity of heat, and this quantity abſtracted from the ſmall body of the thermometer, will lower its temperature conſiderably; but the ſame quantity of heat abſtracted from a bottle of wine, will cool it proportionably leſs than the thermometer. In order to cool a bottle of wine from the uſual temperature of ſpring waters (which in London is about 50° or 51°) down to about 32°; a pound of nitre with a pound of ſalt ammoniac, and a proportionate quantity of water, will generally ſuffice. The ſalts for this purpoſe muſt be finely powdered and as dry as poſſible. But when a moderate refrigeration is required; half a pound of each ſalt and about three pints of water will be ſufficient.

Glauber ſalt, (*viz.* ſulphate of ſoda) diſſolved in water, likewiſe produces a very conſiderable refrigeration; but this ſalt will not produce that effect unleſs it be in its cryſtallized ſtate. In that ſtate, however, it is not eaſily preſerved, ſince the mere contact of air will render it powdery and opaque, in which caſe its ſolution will generate heat rather than cold. On this account, therefore, this ſalt is not ſo much to be recommended, as thoſe which have been already mentioned. Nearly the ſame obſervations are applicable to the muriate of lime, the ſolution of which ſaline ſubſtance, when properly conducted, has a very powerful cooling property.

Thus we have deſcribed all the practicable proceſſes of cooling, which, if not in this country, are undoubtedly of great conſequence amongſt the inhabitants of warmer climates. We have, likewiſe, ſtated the moſt neceſſary particulars reſpecting the quantity of materials proportionate to the effect, whence the intelligent reader may be enabled to make proper choice of a proceſs fit for his purpoſe, agreeably to the circumſtances which the nature of the place, the actual temperature of the atmoſphere, and other particulars, may offer.

There are now two other particulars belonging to the preſent article which deſerve to be briefly mentioned. The firſt is that by cooling, certain bodies acquire electrical properties; and the ſecond is that the law of cooling, or progreſs of refrigeration, furniſhes a method of meaſuring ſuch high degrees of heat, as exceed the ſcale of ordinary thermometers.

With reſpect to the firſt, it has been obſerved that ſulphur, in cooling after having been melted, becomes electrified, ſo as to attract and repel ſmall light bodies like any other excited electric. The ſame thing alſo takes place with wax, chocolate, and a few other ſubſtances. Beſides this effect of cooling after fuſion, there are certain ſolids, like the tourmalin, the Brazilian emerald, &c. which are rendered electrical by any alteration of their temperature, be it from cold to heat, or from heat to cold; but for a full and particular account of thoſe facts, which properly belong to the ſcience of electricity, ſee the articles ELECTRICITY, ELECTRICS, and EXCITATION.

The method of determining high degrees of heat, from the progreſs of cooling, depends upon the following obſervation. Sir Iſaac Newton, conſidering the progreſs of cooling, was led to ſuppoſe, that the heat loſt by any body originally at a high temperature, in equal ſmall portions of time, is as the heat exiſting in it; (reckoning the heat in the body, equal to its exceſs above that of the ſurrounding atmoſphere,) that is, taking the times in arithmetical progreſſion. The portions of heat loſt in thoſe times would be in a geometrical one. The truth of this ſuppoſition has been ſufficiently ſhewn by ſubſequent experiments, the reſult of which has not differed much from the theoretical determinations. Hence we have the following practical rule for determining the high temperature to which a body has been expoſed, from its ſubſequent progreſs of cooling.

Meaſure the time in minutes that elapſes from the hotteſt ſtate of the body (which is the degree ſought,) to ſuch a ſtate of lower temperature as will allow the application of a common thermometer to the body in queſtion, and call this number of degrees A; then having applied the thermometer, ſet down the temperature, which is indicated by the ſame, at the expiration of each ſucceſſive minute, until you have obtained three or four terms of the ſeries, which, as has been ſaid above, will be found to be a geometrical one (omitting, however, trifling differences.) Now, ſince from thoſe few terms it is eaſy to determine any other terms of the ſame ſeries, by the well known arithmetical rules; find ſo many terms of the ſeries aſcending, as are equal to the number of units in A; and the laſt term of the ſeries, thus found, will be the degree of temperature of the body in its hotteſt ſtate. An example will eaſily illuſtrate the application of this rule. Suppoſe it be required to determine the temperature of a piece of red-hot iron at the time that it came out of the forge. Look at the watch the moment the iron is taken out of the fire, and note the minute. Find by trials when the thermometer may be ſafely applied to the iron, *viz.* when the heat is not ſufficient to rarefy the mercury of the thermometer beyond the limit of its ſcale, and when this is practicable, obſerve the temperature of the iron, and the correſponding time as indicated by the watch. Suppoſe, for inſtance, that when the temperature of the iron was 250°, four minutes had elapſed ſince the commencement of the obſervation; therefore in this experiment A is equal to 4. Let the thermometer continue in contact with the iron, and when one minute more has elapſed, let the temperature be 125°. When another minute has elapſed, let the temperature be 62½ degrees; and after this, the obſervation needs not be continued. Now we have three ſucceſſive terms of a geometrical ſeries; *viz.* 62½, 125, and 250; from which four more terms of the ſeries are to be found, (ſince A was found equal to 4,) and the laſt of thoſe terms is the number of degrees indicating the temperature ſought. By dividing 250 by 125, or the latter by 62½, we have the quotient 2, (or nearly 2) which is the multiplier of the ſeries, and therefore multiplying 250 by 2, we have the term 500, which multiplied by 2, gives the next term 1000, which multiplied by 2, gives 2000; and laſtly this term multipled by 2, gives the fourth term 4000; hence we conclude, that when the iron was taken out of the furnace, its temperature was 4000 degrees. The laſt term of the ſeries may be found out by other means, but we have choſen the eaſieſt, for the conveniency of all readers. The two ſeries are annexed.

Time elapſed in minutes.	Correſponding heat.
0.	4000°.
1.	2000.
2.	1000.
3.	500.
4.	250.
5.	125.
6.	62½.

Inſtead of minutes, the intervals of time may be half minutes, or hours, or, in ſhort, of any other denomination; provided they be all equal.

Cooling *of liquors*, in *Domeſtic Economy*, is a practice of ancient origin, and of general prevalence in warm countries, and, during the heat of ſummer, even in colder climates. This practice, as ſome have thought, is referred to by Solomon, in the book of Proverbs (ch. xxv. 13.); but however this be, evidences of it are very numerous in the works of the Greeks and Romans. Ice and ſnow were generally uſed for this purpoſe, and repoſitories were conſtructed for keeping theſe cooling materials. That the ſnow was preſerved in pits or trenches is aſſerted by many; particularly by Seneca (Quæſt. Natur. iv. 13.) and Pliny (H. N. l. xix. 4.) When Alexander the Great beſieged the city of Petra, he cauſed thirty trenches to be dug, and filled with ſnow, which was covered with oak-branches, and which was kept in that manner for a long time (Athenæi Deipnos. iii. p. 124.) Plutarch ſays (Sympos. vi. Quæſt. 6.), that a covering of chaff and coarſe cloth is ſufficient; and a like method is now practiſed in Portugal. Where the ſnow has been collected in a deep gulph, ſome graſs or green ſods, covered with dung from the ſheep-pens, are thrown over it; and under theſe it is ſo well preſerved, that it is ſent through the whole ſummer for the diſtance of 60 Spaniſh miles to Liſbon. When the ancients wiſhed to have cooling liquors, they either drank the melted ſnow, or put ſome of it in their wine, or they placed jars filled with wine in the ſnow, and ſuffered it to cool there as long as they thought proper. The diſſipated and luxurious Heliogabalus cauſed whole mounts of ſnow to be heaped up in ſummer to cool the air (Lamprid. Vit. Heliogab. c. 23.) That ice was alſo preſerved for the like purpoſe is probable from the teſtimony of various authors, Pliny, Seneca, &c.; but it appears not to have been uſed ſo much in warm countries as in the northern. At preſent ſnow is employed in Italy, Spain, Portugal; but in Perſia, ice. The art of cooling water without ſnow or ice was ſoon ſuggeſted to mankind, by obſerving, that it became cold more ſpeedily when it had been previouſly boiled, or at leaſt warmed, and then put in a veſſel among ſnow, or in a place much expoſed to the air. Pliny (H. N. l. xxxi. 3. 23.) ſeems to aſcribe this to the invention of Nero; and a jocular expreſſion of Suetonius (Vit. Ner. c. 48.) renders it probable, that he was fond of water thus cooled. But this method was much more ancient than Nero; for it ſeems to have been known to Hippocrates (De Morb. Vulgar. lib. vi. 4.); and Ariſtotle was acquainted with it; for he ſays (Meteorol. i. cap. 12.) that ſome were accuſtomed, when they wiſhed water to become ſoon cold, to place it firſt in the ſun and ſuffer it to become warm. He relates alſo, that the fiſhermen near the Black Sea poured boiling water over the reeds, which they uſed in fiſhing on the ice, to cauſe them to freeze ſooner. See alſo Galen, in lib. vi. Hippocrat. de Morb. Vulg. Comment. 4, 10. Athenæus remarks (Deipnos. iii.) that the pitchers filled with water, which had become warm by ſtanding through the whole day in the ſun, were kept continually wet during the night, by ſervants deſtined to that office, and in the morning they were bound round with ſtraw. In the iſland Cimolus, water which had become warm in the day-time was put into earthen jars, and depoſited in a cool cellar, where it became as cold as ſnow. From theſe facts it appears to have been a general opinion, that water which had been warmed or boiled, was ſooneſt cooled, and acquired a greater degree of refrigeration. The ſame opinion prevails at preſent in the ſouthern countries of Aſia, and perſons there let their water boil before they expoſe it to the air to cool. The experiments, however, that have been made on this ſubject, have given different reſults. Beckmann (ubi infra) inclines to the opinion, that the cooling of water in ancient times is not to be aſcribed ſo much to the boiling as to the keeping of the jars continually wet, and to the air to which they were expoſed. See Congelation and Freezing, and alſo the preceding article.

Another method of cooling water ſeems to have been known to Plutarch. It conſiſted in throwing into it ſmall pebbles or plates of lead (Sympoſ. vi. 5.)

The practice of cooling liquors, at the tables of the great, was not uſual in any country beſides Italy and the neighbouring ſtates, before the end of the 16th century. In the middle of that century, there were no ice-cellars in France. Towards the end of this century, under the reign of Henry III., the uſe of ſnow muſt have been well known at the French court, though it appears that it was conſidered by the people as a mark of exceſſive and effeminate luxury. Towards the end of the 17th century, this luxury muſt have been very common in France. At that period there were many who dealt in ſnow and ice; and that was a free trade which every one might carry on: but ſoon after government farmed out a monopoly of cooling waters.

The method of cooling liquors by placing them in water, in which ſalt-petre has been diſſolved, could not be known to the ancients, becauſe they were unacquainted with that ſalt. This property of ſalt-petre was firſt diſcovered in the firſt half of the 16th century; and it was not remarked till a long period afterwards that it belongs alſo to other ſalts. The Italians were the firſt perſons by whom it was employed; and about the year 1550, all the water, as well as the wine, drunk at the tables of the great and opulent families at Rome, was cooled in this manner. Towards the end of the 16th century this method of cooling liquors was well known. Mr. Beckmann ſays, that he cannot determine who firſt conceived the idea of mixing ſnow or ice with ſalt-petre, and other ſalts, which increaſe the cold ſo much, that a veſſel filled with water, placed in that mixture, is congealed into a ſolid maſs of ice, that may be uſed on the table, but the earlieſt account of it he has been able to find is in a work of Latinus Tancredus, a phyſician and profeſſor at Naples, who, in his book, "De Fame et Siti," publiſhed in 1607, ſpeaks of this experiment. In 1626 Sanct. Sanctorius, in his Commentary on the Works of Avicenna, relates, that, in the preſence of many ſpectators, he had converted wine into ice, not by a mixture of ſnow and ſalt-petre, but of ſnow and common ſalt. When the ſalt, he ſays, was equal to a third part of the ſnow, the cold was three times as ſtrong as when ſnow was uſed alone. Lord Bacon, who died in 1626, ſays, that a new method had been found out of bringing ſnow and ice to ſuch a degree of cold, by means of ſalt-petre, as to make water freeze. This, he tells us, can be done alſo with common ſalt; and he adds, that in warm countries, where ſnow was not to be found, people made ice with ſalt-petre alone; but that he had never tried the experiment. Mr. Boyle, who died in 1691, made experiments with various kinds of ſalt; and he deſcribes, how, by means of ſalt, a piece of ice may be frozen to another ſolid body. Des Cartes ſays, that, in his time, this was a well-known phenomenon, but highly worthy of attention. Since that period, the art of making ice has been mentioned in the writings of all philoſophers, where they treated on heat and cold. Towards the end of the 17th century, the French began to congeal all kinds of well-taſted juices, which were ſerved up as refreſhments at the tables of the great and wealthy. This was a grand invention for the art of cookery, and afterwards it became common, eſpecially in the laſt century, and ſince that time the confectioners have univerſally practiſed it. Beckmann's Hiſt. of Inventions, vol. ii. See Freezing and Ice.

Cooling *medicines*, thoſe which have a tendency to diminiſh febrile heat, to allay thirſt, and to leſſen the activity of the circulation. They conſiſt chiefly of diluents, acids, and neutral ſalts. With the uſe of theſe a cooling regimen is commonly combined, which conſiſts in a free employment of thin watery drinks, and a forbearance from every thing ſtimulating; ſuch as animal food and fermented or ſpirituous liquors. Occaſional laxatives and gentle diaphoretics contribute to the ſame purpoſe. See Refrigerants.

COOLI-POU, in *Geography*, a port of Chineſe Tartary; 5 miles N. of Tie-ling-Hotun.

COOLLO, a town of Hindooſtan, in the country of Oriſſa; 39 miles S.W. of Cattack.

COOLOOME, an Indian town, ſituated on the W. ſide of Talapooſe river. See Talapoose.

COOM, a term for ſoot that gathers over an oven's mouth: alſo for that black greaſy ſubſtance which works out of the wheels of carriages, and with which the axle-trees and boxes have been daubed or ſmeared over, in order to leſſen friction, and make them run eaſy.

Coom, or ſoot, is ſometimes uſed in medicine, infuſed in wine with other ingredients, as an anti-hyſteric, and againſt palpitations of the heart, &c. The ſpirit of ſoot is alſo uſed for the ſame intentions, and in cephalic caſes.

COOMB, or *Carnock of wheat*, according to the 9th and 51ſt Henry III., 12th Henry VII., &c. was, 256 ℔ troy = 210.6614 ℔ avoirdupoiſe = 2 ſtrikes = 16 pecks = 32 gallons = 256 pints or pounds.

Coomb, *Coom, or ſack of corn*, is = 2 long ſtrikes = 4 Wincheſter buſhels = 16 pecks = 32 dry gallons = 128 dry quarts = 256 dry pints = 8601.6 cubic inches = 4.97 cubic feet = 1.843621 cubic yards = 17.32142 cubic links. In ſome of the fen diſtricts it conſiſts of 4 buſhels, and each buſhel of 8 gallons and a quart.

COOMBE Hill *Canal*, in *Geography*, is a ſhort canal, in Glouceſterſhire, whoſe principal trade conſiſts in carrying coals from the pits to the Severn river. See Canal.

COOMINGS, in *Naval Architecture*. See Coamings.

COOMTAH, in *Geography*, a town of Hindooſtan, in the country of Berar; 45 miles N.E. of Nagpour.

COOP, in *Rural Economy*, a provincial term, ſometimes applied to a tumbril or cart encloſed with boards, to carry dung, ſand, grains, &c. See Cart.

Coop, alſo ſignifies a pen, or encloſed place, where lambs, poultry, &c. are ſhut up, to be fed or fattened.

Coop's *Town*, in *Geography*, a town of America, in the ſtate of Maryland, and county of Harford; 12 miles N.W. of Harford, and 22 north-eaſterly of Baltimore.

COOPA, a town of Perſia, in the province of Irak; 30 miles E.N.E. of Iſpahan.

COOPER, Samuel, in *Biography*, a miniature painter, whoſe works are deſervedly held in the higheſt eſtimation. He was born in London in 1609, and was inſtructed by his uncle, Hoſkins, who was himſelf a limner of conſiderable merit. The ſcholar, however, ſoon ſurpaſſed his maſter in the variety of his tints, the clearneſs of his carnations, and the beautiful management of his hair. The works of Vandyke were the models upon which he formed his ſtyle; and ſo perfect, yet ſo bold, is the imitation, that were ſome of Cooper's pictures magnified to the ſize of life, they would ſcarcely loſe by their compariſon with the fineſt heads of the great Flemiſh maſter. He was the firſt who gave to his miniatures the freedom and ſtrength of oil painting; and had his ſkill in drawing the other parts of the body been equal to that which he evinced in the face, his works might have challenged the moſt ſcrutinizing eye of criticiſm. He ſeems, however, to have been conſcious of his defects, and, probably on that account, left many of his fineſt pictures with the neck and arms unfiniſhed. It would far exceed our preſent limits to enumerate even the beſt of Cooper's works. His portrait of Oliver Cromwell, which was lately in the poſſeſſion of ſir Thomas Frankland, a deſcendant of Oliver, is deſcribed as a maſter-piece of character, and was engraved by Vertue. Mr. Walpole mentions ſome of his other productions in the cloſet of queen Caroline, at Kenſington; particularly a fine portrait of general Monk, of which the head only is finiſhed. He was employed ſome time by the court of France, and lived ſeveral years in Holland. He died in London, May 5th, 1672, and was buried in Pancras church, where a monument is erected to his memory. Walpole's Anecdotes.

Cooper, Alexander, was the brother of the preceding artiſt, and, with him, received inſtruction in miniature painting from their uncle, Hoſkins. We learn from Walpole, that Alexander painted landſcapes and figures in water colours, as well as portraits. The ſame author mentions the ſtory of Diana and Actæon by this maſter, at Burleigh. He reſided ſome time at Amſterdam, and ultimately entered into the ſervice of queen Chriſtina. Walpole's Anecdotes.

Cooper, Richard, a painter and engraver, a reſident of Edinburgh, who flouriſhed in 1730. Amongſt other works, he engraved the portrait of William Carſtares, and that of Andrea Allen, the painter, after William Robinſon.—Mr. Strutt mentions another *Richard Cooper*, who reſided at London, and flouriſhed in 1762. Like the former artiſt, he engraved portraits. One of his beſt prints repreſents the five children of Charles I., accompanied by a great dog, from a picture of Vandyke. Other artiſts of the name of Cooper are mentioned by Heinecken. Strutt.

Cooper, or Couper, Thomas, a learned prelate of the ſixteenth century, was born at Oxford about the year 1517, and educated in grammar learning in the ſchool joining to St. Mary Magdalen College; and afterwards ſtudied in that college, where he took the ſeveral degrees, and ſucceeded to a fellowſhip. When queen Mary came to the throne, he declined the purſuits of divinity for the ſtudy of phyſic, being a ſound proteſtant in principle. Upon the death of that ſovereign, he reſumed his former ſtudies, and became a frequent and celebrated preacher. He was made dean of Chriſt-Church in Oxford, and was for ſeveral years vice-chancellor of the univerſity. In 1569, he was inducted to the deanery of Glouceſter; and, in the following February, was conſecrated biſhop of Lincoln. His diſtinguiſhed merit and great zeal, in the performance of the duties of his high office, recommended him to his ſovereign's favour, who cauſed him to be tranſlated, in 1584, to the rich biſhopric of Wincheſter, where he became celebrated for his learning, and for the exemplarineſs of his conduct. Soon after his conſecration, he went and reſided in his new dioceſe; but being apprehenſive of danger from the papiſts, he petitioned the privy council to ſuppreſs their boldneſs. Among other methods propoſed by the biſhop, were the following, which exhibit the true ſpirit of the times: "That an hundred or two of obſtinate recuſants, luſty men, well able to labour, might, by ſome convenient commiſſion, be taken up, and ſent into Flanders, as pioneers and labourers; whereby the country would be diſburthened of a company of dangerous people: and the reſt that remained be put in ſome fear." In 1588 he preached at St. Paul's Croſs, November 17th, being the day of public thankſgiving, as well for the queen's acceſſion to the throne, as for the ſignal victory obtained over the Spaniſh Armada. He died at Wincheſter, April 29th, 1594, and was buried in the cathedral there, on the ſouth ſide of the choir, a little above the biſhop's ſeat. His publications were numerous, among which are, 1. "The Epitome of Chronicles, from the 17th year after Chriſt to 1540, and thence afterwards to the year 1560." A part of this work was compoſed by Thomas Lænquet, a young man of 24 years of age, who died before he could complete what he had taken in hand. 2. "Theſaurus Linguæ Romanæ et Britannicæ, et Dictionarium Hiſtoricum et Poeticum, Lond. 1565." This work was ſo much eſteemed by queen Elizabeth, that ſhe endeavoured to promote the author as high as poſſible in the church. To theſe may be added, "An Expoſition of certain Parts of the Old Teſtament;" and "Sermons on various Subjects." Biſhop Cooper's character is repreſented by writers in a very advantageous light. "He was," according to A. Wood, "furniſhed with all kinds of learning, almoſt beyond all his contemporaries; and not only adorned the pulpit with his ſermons, but alſo the commonwealth of learning with his writings." Many other teſtimonies might be adduced, in favour of the high reputation to which he attained with his contemporaries, among theſe is that of the celebrated ſir John Harrington. Biog. Brit.

COOPER, ANTHONY ASHLEY, firſt earl of Shafteſbury, one of the ableſt perſons, and moſt diſtinguiſhed miniſters of the 17th century, was ſon of ſir John Cooper of Rockborn, in the county of Southampton, bart., by Anne, daughter and ſole heireſs of ſir Anthony Aſhley of Winborne St. Giles, in the county of Dorſet, from whom he inherited an eſtate of 8000*l.* per annum. He was born at Winborne, July 22, 1621, and educated with the greateſt care under the eye of his parents, during his infancy, in which he diſcovered ſuch talents, that extraordinary things were predicted of him, while he was yet a boy. Before he was ten years of age, he had the misfortune to loſe his father; at fifteen he became a fellow-commoner of Exeter college Oxford, under the tuition of the celebrated Dr. Prideaux, who was then rector of it. At the univerſity, where he remained but two years, he obtained a character for great aſſiduity, and extraordinary genius. From Oxford he removed to Lincoln's Inn for the ſtudy of the law, and before he had completed his nineteenth year, he was choſen member of parliament for Tewkeſbury. This was in the year 1640; and, at the commencement of the civil war, he adhered to the king's ſide, though he was always a friend to peace, and thought conceſſions ſhould be made by both parties to attain it. To accompliſh this great object, it is ſaid by the great Mr. Locke, that he repaired to the king at Oxford, and propoſed a method of putting an end to the war, by treating with the parliamentary garriſons, and promiſing them amneſty for the paſt, and full ſecurity for liberty in the future. The plan did not ſucceed; and when ſir Aſhley found himſelf ſuſpected by the court, and that his perſon was in conſiderable danger, he went over to the parliament party, by whom he was kindly received, as well on account of his great talents, as for the influence which his property muſt create. He raiſed forces in Dorſetſhire, and in 1644 he rendered the cauſe in which he acted ſome very ſignal ſervices. He ſeems even at this period to have been looked up to by the royal party, ſince he was truſted with private negociations between the king and Denzil lord Hollis, at the treaty of Uxbridge, for which he was afterwards queſtioned, and ſeverely threatened, in parliament. After the battle of Naſeby, he attempted to check the overgrown power of parliament, by exciting the "Club men," a body of people in ſeveral counties, encouraged to take up arms, to declare themſelves as a middle party, and to inſiſt upon a ſort of treaty by which they might be reſtored to the benefits of the law, and the protection of the conſtitution. The plan was in ſome meaſure executed; Fairfax received their propoſals, and promiſed to communicate them to parliament, but Cromwell, and other leaders of that party, perceiving that no time was to be loſt, attacked the club-men without mercy, killed great numbers of them, and diſperſed the reſt. The ſcheme was abandoned, but the author of it contrived ſo as not only not to involve himſelf in their fate, but to obtain ſhortly after the office of high ſheriff of the county of Wiltſhire. Owing either to his great influence in the country, or to the warineſs of his own well-planned ſchemes, he was elected a member of the convention, which ſucceeded to the long parliament diſmiſſed by Cromwell; and, in 1754, we find him a member of parliament, and one of thoſe who proteſted againſt the tyrannical government of Cromwell. He was on other occaſions a ſtrong, though perhaps neither a ſteady nor uniform, oppoſer of the protector, as he cauſed himſelf to be ſtyled. See CROMWELL. Sir Anthony was nevertheleſs choſen by the protector to be one of his privy council; and it has been aſſerted, that he even ſought an alliance by marriage with the baronet's daughter. Dr. Kippis, however, who inveſtigated the matter, gives no credit to this part of the charge. When Richard Cromwell was depoſed, ſir Anthony was appointed by the rump parliament one of the council of ſtate, and a commiſſioner for the managing army, although, it is now well known, that he was, at the ſame time, engaged in a plan to reſtore Charles II. to the throne, notwithſtanding the ſtrong proteſtations which he made of his innocence when queſtioned on the buſineſs, by which he obtained an acquittal. Like other diſcerning men, he foreſaw, from exiſting circumſtances, that a change in favour of monarchy muſt eventually take place, and therefore he took care to ſecure a claim of merit in the reſtoration, which he promoted with great zeal and aſſiduity, when he perceived an evident tendency to that event. In 1660, he was a member of the healing parliament, and one of twelve who were deputed to invite the return of the king; who, in grateful remembrance of his ſervices, made him a privy counſellor; gave him a commiſſion for the trial of the regicides; and, in the courſe of a year, raiſed him to the rank of peer of the realm, by the title of baron Aſhley of Winborne St. Giles. He was ſoon after appointed chancellor and under-treaſurer of the exchequer, and, upon the death of lord Southampton, one of the lords commiſſioners of the treaſury. He was a member of the celebrated cabal miniſtry, in which, from his ſuperior talents and forcible eloquence, he took a deciſive lead. He continued in the councils and confidence of the king his maſter, during the happieſt part of his reign, and ſtood as high in his favour as any of his miniſters. He was afterwards appointed to the lord lieutenancy of the county of Dorſet, and on the twenty-third of April 1672, was created baron Cooper of Pawlet, and earl of Shafteſbury. In the following November, he was raiſed to the higheſt office of ſtate, *viz.* that of lord chancellor of England, the duties of which ſtation he executed with equal ability and integrity. In his other capacities, of a miniſter and privy counſellor, he has been variouſly deſcribed; but he is allowed, on all hands, to have been one of the ableſt men, and one of the moſt accompliſhed orators that have adorned this country. "The ſhort time," ſays one of his biographers, "that he was at the helm, was a ſeaſon of ſtorms and tempeſts, and it is but doing him ſtrict juſtice to ſay, that they could neither affright nor diſtract him. Whatever he did, he did with his might, and there was a ſpirit and dignity in his adminiſtration, which that government could never recover after he left it. He was the ſoul and genius of the miniſtry while he made a part of it; but whether he did not carry things too high, and out of the reach of all other capacities but his own, it would ſavour of raſhneſs to determine." Some hiſtorians attribute to him the arbitrary counſel of ſhutting up the exchequer, while others aſſert that he oppoſed it with all his power, and drew up a paper of reaſons againſt it. It is certain that he was an earneſt promoter of the declaration for liberty of conſcience, which, though intended principally to favour the Papiſts, probably agreed with his own real judgment, as a decided friend to religious toleration. It is generally admitted that he had no concern in the diſgraceful treaty with Lewis XIV., of which the main object was to render Charles a penſioner on the French monarch; but he was a ſtrenuous ſupporter of the Dutch war, and was guilty of adviſing the illegal meaſure of iſſuing writs for the election of members of parliament, during a receſs, and abuſing the influence of the crown to procure returns in favour of the court. He had not been more than a year in poſſeſſion of the ſeals, when he manifeſted hoſtility to the principles which governed the Stuart family; ſo that the duke of York became his enemy, and at length in Nov. 1673 got him removed from his office. After he had quitted the court, he continued to make a great figure in parliament, and for his warmth in maintaining that a prorogation for fifteen months was equal to a diſſolution, he was committed to the tower, where he remained a priſoner full thirteen months, when he ſubmitted and was releaſed, and the precedent made in his caſe was afterwards reverſed. Previouſly to this, he had ſhewn himſelf a friend to civil and religious liberty, by oppoſing the teſt-bill introduced into the houſe of peers by lord Danby, and on this buſineſs, he is ſaid to have diſtinguiſhed himſelf more than he had ever done. He managed the oppoſition to lord Danby's adminiſtration with ſo much dexterity and vigour, that it was found abſolutely impoſſible to do any thing effectually in parliament, without changing the ſyſtem which then prevailed. The king accordingly diſmiſſed all his privy council at once, and formed a new one, making lord Shafteſbury the lord preſident. He had, however, already drawn upon himſelf the implacable hatred of the duke of York, by ſteadily promoting, if not originally inventing, the project of an "excluſion bill." To him alſo is imputed the contrivance of the Popiſh plot in 1678; which, if it were not a fiction of his own, was urged by him with the greateſt virulence againſt the court party, ſo as to be the means of throwing out lord Danby's adminiſtration; and there is no doubt that he was the author and promoter of all the perſecutions which followed on this buſineſs, as well in the inferior courts as in parliament, with a view of quaſhing the popiſh party entirely, and of excluding the duke from the ſucceſſion, which were points he had moſt at heart, and which he purſued with an indefenſible ſeverity. Amidſt many violent and very unjuſt proceedings, he was the author of a meaſure of ſignal national benefit, the paſſing of the "Habeas Corpus act;" to the protection of which he had occaſion to appeal ſhortly after, for his own perſonal ſecurity. His new employment was ſhort-lived, as he was diſmiſſed after holding it little more than five months; and ſome of the practices to which he had recourſe againſt the papiſts, were turned againſt himſelf. He was applied to by a man pretending to make diſcoveries relating to the popiſh plot, and the murder of ſir Edmundbury Godfrey, provided that for this ſervice he might obtain a pardon. The man was conducted to the privy council; but inſtead of giving the information expected, he charged the noble earl with endeavouring to ſuborn him. Upon this information his lordſhip was apprehended on the 2d of July 1681, and after an examination by his majeſty in council, he was committed to the tower, where he remained four months, notwithſtanding he took every legal method to obtain a trial, or to be admitted to bail, according to the principles of the habeas corpus act. At length, on the 24th of October, a bill was preſented to the grand jury at the ſeſſions houſe in the Old Bailey, againſt his lordſhip, for high treaſon. Witneſſes were brought againſt him, but their characters were too infamous to permit their evidence to have the ſmalleſt degree of weight. Conſiderable ſtreſs was laid upon the draught of an aſſociation found in his ſtudy, which, however, was neither written nor ſigned by the noble earl; and the jury, after ſome conſideration, threw out the bill, and he was acquitted, amidſt the acclamations of the people. A medal was ſtruck on the occaſion, which was the cauſe of a very bitter ſatirical poem, from the pen of Dryden, who had before perſonified Shafteſbury, as the great counſellor of rebellion, in his "Abſalom and Achitophel."

As ſoon as he was at liberty, lord Shafteſbury endeavoured to vindicate himſelf by law, and brought an action againſt a perſon for ſpeaking of him as a traitor: this he thought proper to diſcontinue before it came to trial. For many years he had reſided at Thanet-houſe in Alderſgate-ſtreet; but finding his health decay, his ſpirits declining, and the times becoming more ſerious, he withdrew into Holland, where he arrived in November 1682, and in the following January he died at Amſterdam in the ſixty-ſecond year of his age. His body being embalmed was tranſported to England, and buried with his anceſtors, at Winborne St. Giles. Much has been written concerning the character of this nobleman. As a public man, he was, ſays Dr. Kippis, guilty of manifold inconſiſtencies, and ſubmitted to ſhameful compliances. "There were, however," adds the ſame candid and excellent biographer, "three points in which, through the uſual tenor of his life, the earl of Shafteſbury was entitled to applauſe. Theſe were, his attention to the protection and advancement of trade and commerce; his endeavours to counteract the growing power of France; and his attachment to the cauſe of religious liberty. He wrote an eſſay on toleration, ſtill preſerved in the family, which was evidently the ground work of Mr. Locke's admirable letters on that ſubject. Several of the meaſures, propoſed and ſupported by him, were preparatory to thoſe that were adopted at the Revolution, and he contributed, by his ardour, to raiſe and animate the ſpirit, which, in the end, produced the event, ſo that amidſt all his obliquities and faults, he deſerves to be celebrated, as having been no ſmall benefactor to the free conſtitution of England." He left in MS. a hiſtory of his own times; and ſome of his ſpeeches have been publiſhed. He was thrice married, but left only one ſon, who ſucceeded him in his eſtates and titles, and who died in November 1699, and was ſucceeded by Anthony his ſon and heir, of whom we are now to give an account.

COOPER, ANTHONY ASHLEY, third earl of Shafteſbury, was born Feb. 26, 1670-71, at Exeter-houſe, London, which was at that time the town-reſidence of his grandfather, who undertook the ſuperintendance of his education. He firſt entruſted him to the care of a learned lady of the name of Birch, under whom he made ſuch rapid advances in the Greek and Latin languages, as to be able to read the common authors in each before he was eleven years old. He was then placed in a private ſchool, where he continued till the death of his grandfather, when he was ſent to Wincheſter; where, on account of the inſults which he ſuffered, through the hatred borne to his grandfather's memory by the friends to arbitrary power, he remained but a ſhort time, and, in 1686, he commenced his travels under the care of a well qualified tutor. With him he ſpent much time in France and Italy, improving himſelf in the languages and accompliſhments of thoſe countries, and laying the foundation of the knowledge and taſte for which his own ſubſequent writings were juſtly celebrated. He returned to England in 1689, and was offered a ſeat in parliament, which for the preſent he declined, wiſhing rather to employ all his leiſure in the improvement of his mind, and in extending his knowledge on ſubjects of the greateſt importance. In theſe views he ſucceeded, and laid a foundation in learning which was accurate, extenſive, and truly liberal. After purſuing the ſtudies congenial to his temper, with much ardour and almoſt unabating diligence, for nearly five years, he was elected member of parliament for Poole. In this high ſtation he ſhortly had an opportunity of expreſſing that attachment to liberty, by which he was diſtinguiſhed through the whole of his life, and of conciliating the houſe to the object which he had in view. The occaſion was the introduction of a bill for granting, among other things, the aid of counſel to perſons indicted for high-treaſon. Lord Aſhley had prepared a ſpeech for the purpoſe, but when the moment came, in which he was to deliver it, he was utterly unable to proceed. After a ſhort pauſe, he addreſſed the ſpeaker. "If I, ſir, who only riſe to give an opinion on the bill now depending, am ſo confounded, that I am unable to expreſs the leaſt of what I propoſed to ſay, what muſt be the condition of that man, who, without any aſſiſtance, is pleading for his life, and under the apprehenſion of being deprived of it?" This happy turn of thought, ſo appropriate to the occaſion, is ſuppoſed to have contributed more than any of the arguments which were urged in obtaining the juſtice for which he pleaded. The neceſſity of this wiſe and humane law has been of late years amply manifeſted by the conduct of certain great law officers, who took the very moderate ſpace of ſeven, nine, and eleven hours in opening caſes of *ſuppoſed* high-treaſon. During the remainder of that parliament, lord Aſhley was indefatigable in the promotion and ſupport of every meaſure in favour of liberty, without regard to the perſon by whom it was introduced, influenced unqueſtionably by an attention to the public good, without feeling the paltry motives which too frequently actuate political men. At the diſſolution in 1698, he reſigned his pretenſions to a ſeat in the houſe, on account of ill health, and with a view alſo of ſecuring more time for literary purſuits. He went to Holland under the aſſumed character of a ſtudent in phyſic: here he cultivated an acquaintance with Bayle, Le Clerc, and other men of celebrity, and it was not till a ſhort time before he left the country that he made his name known. Before his lordſhip's return an imperfect and ſurreptitious edition of his "Enquiry concerning Virtue," was publiſhed in a moſt unhandſome manner by Mr. John Toland, who, ſays Dr. Kippis, in this tranſaction, repaid with ingratitude a very generous benefactor. His lordſhip bought up the edition, and ſet about compleating the treatiſe, which afterwards appeared as the ſecond volume of the "Characteriſtics." Soon after lord Aſhley's return to England, he became, by the deceaſe of his father, the earl of Shafteſbury, but he did not take his ſeat in the houſe of peers till the beginning of the year 1700-1, when his friend, lord Somers, ſent a meſſenger to acquaint him that his preſence was neceſſary, on account of the Partition-treaty, which, at that time, was under the conſideration of parliament. During the remainder of the ſeſſion he attended his duty as frequently as the ſtate of his health permitted, zealouſly ſupporting the meaſures of king William, who was, at that period, negociating the grand alliance. That ſovereign regarded the ſupport of lord Shafteſbury ſo highly, that he wiſhed to appoint him ſecretary of ſtate. This honour his health did not allow him to accept; but he was nevertheleſs aſſiduous in rendering to his majeſty advice on every important occaſion. Soon after the acceſſion of queen Anne, lord Shafteſbury retired from public life, being no longer a friend to the meaſures of the court. Miniſters now took from him the vice-admiralty of the county of Dorſet, which had been held by his family for three ſucceſſive generations. He went to Holland a ſecond time, where he ſpent two years among the learned connections, which he had already formed in that country. About this period the French prophets having excited a conſiderable diſturbance, in the nation, by their enthuſiaſtic extravagances; ſome great men recommended proſecutions and puniſhments as the only methods of ſuppreſſing them: to theſe lord Shafteſbury was decidedly inimical, thinking that ſuch meaſures would increaſe rather than cure the malady. This was the origin of his "Letter on Enthuſiaſm," which he ſent to lord Somers, then preſident of the council, which, being approved by that nobleman and others, was publiſhed in 1708, though without the name of the author, or that of the perſon to whom it was addreſſed. In the following year he publiſhed his "Moraliſts," a philoſophical rhapſody, being a recital of certain converſations on natural and moral ſubjects; and in a few months afterwards his "Senſus Communis; an Eſſay upon the Freedom of Wit and Humour, in a Letter to a Friend." In the ſame year he married Miſs Jane Ewer, the youngeſt daughter of Thomas Ewer, eſq. of Lee, in Hertfordſhire. In forming this connection, it ſhould ſeem that his lordſhip was principally influenced by the ſolicitations of his friends, rather than from any inclination of his own, or high expectations of the happineſs of that ſtate. Letters to this effect are preſerved in the Biographia Britannica. By his lady, to whom he was previouſly related, he had an only ſon Anthony, afterwards earl of Shafteſbury.

In 1710 the noble lord publiſhed his "Soliloquy, or Advice to an Author;" after which his health obliged him to try the effects of a warmer climate. He accordingly, in 1711, paſſed through France and Piedmont, and fixed his reſidence at Naples, where he died on the 4th of February, 1712-13, at the early age of forty-two. During his abode at Naples, he finiſhed his "Judgment of Hercules," and the "Letter concerning Deſign," which have ſince been added to the "Characteriſtics." It was in 1711 that the firſt edition was publiſhed of all the Characteriſtics, in the ſame order in which they now ſtand: but this publication not being entirely to his lordſhip's ſatisfaction, he chiefly employed his time abroad in preparing his writings for a more elegant edition, which was given to the world ſoon after his deceaſe, in the year 1713. The ſeveral engravings, that were then firſt interſperſed through the volumes, were all invented by himſelf, and deſigned under his immediate inſpection. The impreſſion of the "Characteriſtics of Men, Manners, Opinions, and Times," in 3 vols. 8vo., contains the whole of his works which he intended to ſubmit to the judgment of the public. In the year 1716, ſome of his private letters upon philoſophical and theological ſubjects were publiſhed, under the title of "Several Letters written by a noble Lord to a young Man at the Univerſity;" and in 1721, another collection of the ſame kind appeared, entitled, "Letters from the Right Honourable the late Earl of Shafteſbury to Robert Moleſworth, eſq. now Lord Viſcount of that Name; with two Letters written by the late Sir John Cropley: to which is prefixed, a large Introduction by the Editor." That editor, ſays the candid biographer already referred to, was Mr. Toland, who, in the preſent, as well as in the former caſe, aſſumed a liberty not very agreeable to the family. In their opinion, as the correſpondence was almoſt entirely of a private nature, it was on that account unfit for public view. It nevertheleſs ſet his lordſhip's integrity in the moſt amiable point of light. Lord Shafteſbury alſo wrote a preface to a volume of Dr. Whichcote's ſermons, publiſhed in 1698; and in his Letters to a young Man at the Univerſity, expatiates on the merits of Burnet, Hoadly, Tillotſon, Barrow, Chillingworth, and Hammond, as the great pillars of the church againſt fanaticiſm. But however highly he might eſteem the labours of modern divines, his principal admiration was directed to the writings of antiquity. Theſe were the conſtant ſubjects of his ſtudy, and on theſe his philoſophy was built. His favourite books were the moral works of Xenophon, Horace, the Commentaries and Enchiridion of Epictetus, as publiſhed by Arrian, and Marcus Antoninus. Theſe authors he always carried with him, in his various excurſions; and they are ſtill extant, filled with marginal notes, written in his own hand. It remains now to notice more particularly the writings of lord Shafteſbury, which, by one claſs of critics, have received the moſt extravagant applauſe, and, by another, have been the ſubjects of indiſcriminate condemnation. They have been examined with a critical eye, and in rather an elaborate manner, by Dr. Kippis, to whoſe article, in the Biographia Britannica, we refer the reader, contenting ourſelves with a brief outline. Lord Shafteſbury's Letter on Enthuſiaſm was written from excellent motives: it contains many admirable remarks, delivered in a neat and lively ſtrain; but it wants preciſion; conveys but little information; and contains ſome exceptionable paſſages. The ſame character may be given, with truth and juſtice, of "The Eſſay on the Freedom of Wit and Humour," deſigned to defend the application of ridicule to ſubjects of ſpeculative inquiry, and among others to religious opinions. His "Soliloquy, or Advice to an Author," met with more general approbation. It contains a variety of excellent matter; and what the noble lord has advanced in recommendation of ſelf-examination, and in defence of critics and criticiſm, is particularly valuable: it is evidently the reſult of the author's knowledge and refined taſte in books, in life, and manners. Lord Shafteſbury's "Enquiry concerning Virtue" obtained more general applauſe. It is ably and finely written, and maintains with great force the important truth, that virtue is the greateſt happineſs, and vice the greateſt miſery of men. This work has met with much oppoſition from thoſe who deduce the principles of virtue from ſelf-love only, and refer the obligation of it ſolely to the will of God. In this "Enquiry," the noble author appeared in the cloſe, the logical, and the didactic form. But in the "Moraliſts," he aſſumes a higher tone, and figures in a new character. Here he preſents himſelf in the mode of dialogue, and is the emulator of Plato, in the boldeſt poetic manner of that eminent philoſopher. Biſhop Hurd ranks it among the beſt compoſitions of the kind in our language. Its matter is highly valuable and important, and preſents us with a truly argumentative and eloquent defence of the doctrines of a Deity and a Providence. The "Miſcellaneous Reflections on the preceding Treatiſes, and other critical Subjects," are intended as a ſort of defence and explanation of his former works: they contain a variety of juſt and ingenious remarks, and much fine writing; but they are written in a deſultory manner, abounding with many exceptionable paſſages concerning revelation. With reſpect to the ſtyle of lord Shafteſbury, we may quote the opinion of Dr. Blair, which is at once accurate and judicious. "His language has many beauties; it is firm and ſupported in an uncommon degree; it is rich and muſical. No Engliſh author has attended ſo much to the regular conſtruction of his ſentences, both with reſpect to propriety, and with reſpect to cadence. All this gives ſo much elegance and pomp to his language, that there is no wonder it ſhould ſometimes be highly admired. It is greatly hurt, however, by perpetual ſtiffneſs and affectation. This is its capital fault. His lordſhip can expreſs nothing with ſimplicity. He ſeems to have conſidered it as vulgar, and beneath the dignity of a man of quality, to ſpeak like other men. Hence he is ever in buſkins, full of circumlocutions and artificial elegance. In every ſentence we ſee the marks of labour and art; nothing of that eaſe which expreſſes a ſentiment coming natural and warm from the heart. Of figures and ornaments of every kind he is exceedingly fond; ſometimes happy in them; but his fondneſs for them is too viſible, and having once laid hold of ſome metaphor or alluſion that pleaſed, he knows not how to part with it. What is moſt wonderful, he was a profeſſed admirer of ſimplicity; is always extolling it in the ancients, and cenſuring the moderns for want of it, though he departs from it himſelf as far as any one modern whatever. Lord Shafteſbury poſſeſſed delicacy and refinement of taſte to a degree that we may call exceſſive and ſickly; but he had little warmth of paſſion; few ſtrong or vigorous feelings; and the coldneſs of his character led him to that artificial and ſtately manner which appears in his writings. He is fonder of nothing than of wit and raillery; but he is far from being happy in it. He attempts it often, but always awkwardly: he is ſtiff even in his pleaſantry, and laughs in form like an author, and not like a man." To this Dr. Kippis adds: "On the reperuſal of the Characteriſtics, we have been clearly convinced, that the noble author was always excellent in the diſpoſition of his words, but that in the choice of them he is frequently liable to cenſure." Lord Shafteſbury, in all his works, ſhews himſelf a zealous advocate for liberty, the ſteady friend of virtue, and a true believer in natural religion. He ſometimes profeſſed himſelf a Chriſtian; but his writings, in many parts, render his faith in the divine miſſion of Chriſt very queſtionable. The noble lord left one ſon, Anthony Aſhley Cooper, the fourth earl, of whom the learned Mr. Huntingford ſays, "there never exiſted a man of more benevolence, moral worth, and true piety." To this high character Dr. Kippis gives his own teſtimony, having had the honour of enjoying his acquaintance and correſpondence. He was the author of the life of his father, in the great General Dictionary. It may not be improper to add in this place, that the tranſlator of Xenophon's Cyropedia was the honourable Maurice Aſhley Cooper, brother to the third earl.

COOPER, JOHN GILBERT, born in 1723, was of an ancient family in Nottinghamſhire. He received the early part of his education at Weſtminſter ſchool, and finiſhed his ſtudies in Trinity College, Cambridge. As an author, his firſt work was on the "Power of Harmony," formed on the model of the "Pleaſures of the Imagination." In 1749 he publiſhed "The Life of Socrates, collected from the Memorabilia of Xenophon, and the Dialogues of Plato," &c. Learned notes were added by the Rev. J. Jackſon of Leiceſter. This work was well received, though at preſent it is in no great eſtimation. In 1754 he gave to the world "Letters on Taſte," which were written in an elegant ſtyle, for which, and for the vivacity in the deſcription, they were more admired than for accuracy and depth of thought. Cooper wrote ſome papers in "The World:" his other works are all poetical, of which the principal are, "The Tomb of Shakeſpeare, a Viſion;" "Epiſtles to the Great, from Ariſtippus in Retirement;" "The Call of Ariſtippus, an Epiſtle to Dr. Akenſide;" and "A Tranſlation of Greſſet's Ver Vert." Mr. Cooper was not deſtitute of fancy, but his fancy was not always under proper regulation, and he ſometimes failed in the preciſion of his ideas. He excelled in the light, eaſy, and epiſtolary ſtrain. His ſentiments have conſiderable ſameneſs, being derived from the Shafteſburian ſchool of philoſophy, of which he was a diſciple. He was an active member of the Society for the Encouragement of Arts, Manufactures, &c.; a diligent and uſeful magiſtrate. He died in 1769, of a fit of the ſtone.

Cooper, on board a *Ship*, the perſon that looks to the caſks and all other veſſels, for beer, water, or any other liquors. He has a mate under him.

Cooper, in *Geography*, one of the Bermudas iſlands.

Cooper, a large and navigable river of America, which mingles its waters with Aſhley river, below Charleſton city, in South Carolina. Theſe form a ſpacious and convenient harbour, which communicates with the ocean, juſt below Sullivan's iſland, leaving it on the N. 7 miles S.E. of the city. Cooper river is a mile wide at the ferry, 9 miles above Charleſton.

Cooper's-*Bridge*, over the Calder river, on the road between Huddersfield and Leeds in Yorkſhire, is the place at which ſir John Ramſden's canal connects with the Calder and Hibble navigation, which now has become a place of conſiderable traffic, in conſequence of the junction of the Huddersfield canal with the other end of ſir John Ramſden's canal. See Canal.

Cooper's *Iſland*, one of the Virgin iſlands in the Weſt Indies, S. W. of Ginger iſland, uninhabited; about five miles long, and from one to two broad. N. lat. 18° 7′. W. long. 63° 5′.

Cooper's, or de Kuiper *iſland*, lies on the north coaſt of the iſland of Java, near Batavia; about 1600 feet from the iſland of Onruſt, and about one-third leſs in ſize. The Dutch company have ſeveral warehouſes in this iſland, in which they chiefly lay up coffee. At its ſouth ſide there are two pier-heads, where veſſels may load and diſcharge. Over the iſland are interſperſed ſeveral large tamarind trees, which afford an agreeable ſhade. The workmen that are employed here in the day-time, are fetched over at night to Onruſt, and two are left, as a watch, together with a number of dogs, ſo remarkably fierce, that no one dares to ſet his foot on the iſland at night.

Cooper's *Iſland*, an iſland in the Southern Pacific ocean, near the E. coaſt of the iſle of Georgia. It is a rock of conſiderable height, about five miles in circuit, and one mile from the main. At this iſle the main coaſt takes a S.W. direction for the ſpace of four or five leagues to a point, called by Cook "Cape Diſappointment." Off that are three ſmall iſles, the ſouthernmoſt of which is green, low, and flat, and lies one league from the cape. S. lat. 54° 57′. W. long. 36° 4′.

Cooper's *Town*, a poſt town, and townſhip of America, in the ſtate of New York and county of Otſego. It is the compact part of the townſhip of Otſego, and the chief town of the country round lake Otſego. It is pleaſantly ſituated at the S.W. end of the lake, on its banks, and thoſe of its outlet; 12 miles N.W. of Cherry valley, and 73 W. of Albany. It has a court-houſe, gaol, and academy. In 1789 it had only three houſes; in 1791 it contained 292 inhabitants; and in 1795, 50 houſes had been erected on an improved plan, regularly laid out in ſquares. N. lat. 42° 44′. W. long. 74° 48′.

Cooper's *Town*, a town of Pennſylvania, ſituated on the Suſquehannah river. In 1785 this was a wilderneſs; but in nine years after, it contained 1800 inhabitants, a large and handſome church, a market-houſe, a library of 1200 volumes, and an academy of 64 ſcholars. Four hundred and ſeventy pipes were laid under ground for the purpoſe of bringing water from Weſt mountain, and conducting it to every houſe in the town.

CO-OPERATE, to, in a *Military Senſe*, is to carry a well-directed plan into execution in ſuch a manner, that the troops or forces, how much ſoever divided, may act at one time, on one principle, and towards one end.

CO-OPERATOR, derived from *con*, and *opera*, labour, denotes any cauſe, natural or ſupernatural, which concurs with another to the production of an effect. Thus, nature and medicine co-operate in the cure of diſorders; and the will of man concurs with the grace of God in the performance of good works.

CO-OPERRIE Pallio. See Pallio.

COOPERS, *Company of*. See Company. Coopers are enjoined to make their veſſels of ſeaſonable wood, and to mark them with their own marks, on pain of forfeiting 3*s*. 4*d*.; and the contents of veſſels are to be obſerved under a like penalty, ſo that the beer barrel ſhall contain 36 gallons, a kilderkin 18, a firkin 9, &c. The wardens of the Coopers' company in London, with an officer of the mayor, are to ſearch all veſſels for ale, beer, and ſoap to be ſold there, and to mark thoſe that are right; and they may burn the others: and if any cooper diminiſh a veſſel by taking out the head, or any one of its ſtaves, it ſhall be burnt, and the offender forfeit 3*s*. 4*d*. Stat. 23 Hen. VIII. c. 4.

CO-OPERTURA, in *Antiquity*, a thicket or covert of wood. Chart. de Foreſt. cap. 12.

CO-OPTATION, derived from *co-opto*, I chooſe, ſignifies the admiſſion of members into any college or ſociety. Thus it was anciently applied to the choice of the augurs and pontiffs; and in modern times, to an extraordinary nomination and election of perſons of diſtinguiſhed merit into a learned ſociety.

CO-ORDINATE, ſomething of equal order, rank, or degree, with another.

CO-ORDINATION, in reſpect of cauſes, denotes an order of cauſes, wherein ſeveral of the ſame kind, order, and tendency, concur to the production of the ſame effect.

COORNHAERT, or Cuernhert, in *Biography*. See Theodore Dirk.

COOROORAA, in *Geography*, one of the Pelew iſles, the capital of which is called Pelew; which ſee.

COOS, in *Ancient Geography*, an iſland of the Ægean or Icarian ſea, near Cnidus (now called *Zia*); in which was a city of the ſame name, from which Hippocrates, the celebrated phyſician, and Apelles, the famous painter, were called *Coi*. Here was a large temple of Æſculapius, and another of Juno. It abounded in rich wines, and here were made thoſe "*Coæ veſtes*," which were tranſparent, and are ſo often mentioned by the ancient poets.

Coos, or Cohos, in *Geography*, a country of America, called *Upper* and *Lower Coos*, which lies on the Connecticut river, between 20 and 40 miles above Dartmouth college. Upper Coos is the country S. of Upper Amonooſuck river on John and Iſrael rivers. Lower Coos lies below the town of Haverhill, S. of the lower Amonooſuck. The diſtance from Upper Coos to the tide in Kennebeck river was meaſured in 1793, and found to be but 90 miles.

Coos-*Baybar*. See Cooch-*Bahar*.

COOSA, or Coosa-Hatcha, a river which riſes in the high lands of the Cherokees' country, and joining Tallapooſe, forms Alabama river. Its courſe is generally S. through the country of the Natchez, and other tribes of the Upper Creeks. It is rapid, and full of rocks and ſhoals, ſo that it is hardly navigable by canoes.

COOSADES, an Indian town on Alabama river, in America, about 60 miles above its mouth, on Mobile river; below M'Gillivray's town, and oppoſite the mouth of the Oakfuſkee.

COOSA-HATCHEE, or Coosaw, a river of America, in S. Carolina, which riſes in Orangeburg diſtrict, and after running in a S.S.W. courſe, diſcharges itſelf into Broad river and Whale branch, which ſeparate Beaufort iſland from the main land.

COOSAWATCHIE, or Coosahatchie, a poſt town of America, in the ſtate of S. Carolina, and diſtrict of Beaufort, ſituated on the S.W. ſide of Cooſa river, over which a bridge has been erected. The place is flouriſhing, having about 40 houſes, a court-houſe, and a gaol. The courts formerly held at Beaufort are held here. It is 33 miles diſtant from Beaufort, and 77 W.S.W. from Charleſton.

COOSCOOSOO, a common food among the Moors of Africa, conſiſting of a paſte made of flour in the form of ſmall grains in the manner of Italian paſtes. This is dreſſed by the vapour of broth in a round diſh, with holes like a cullender, and that is fixed in the kettle in which they boil their meat. The cooſcooſoo, contained in the deep plate or cullender, is ſlowly ſoftened, and prepared by the vapour of the broth, with which they take care to moiſten it occaſionally. This is a nouriſhing and agreeable food, and eaten by the common people either with milk or with butter, but ſuperior perſons have it dreſſed by a rich broth made with mutton, poultry, and pigeons or hedge-hogs, and mix it afterwards with freſh butter.

COOSY, Cosa, or Koss, a river of Aſia, which riſes in the mountains of Thibet, takes its courſe through Purneah, and runs into the Ganges, 20 miles E. of Boglipour in the country of Bahar.

COOT, in *Ornithology*. See Fulica *atra*.

COOTE, *Sir* Charles, in *Biography*, a diſtinguiſhed military officer in the 17th century, was the eldeſt ſon of ſir Charles Coote, who was created baronet in April 1621. He was a gentleman of great conſideration in Ireland. Upon the breaking out of the rebellion, in 1641, he had a commiſſion for a regiment of foot, and was made governor of Dublin. From this period, to the year 1652, he was engaged in a great number of important ſervices for his country. In almoſt all the conteſts of which he took a part he was ſucceſsful. After Ireland was reduced to the obedience of the parliament, ſir Charles was one of the court of juſtice in the province of Connaught, of which he was made preſident by act of parliament. Being in England at the time of the depoſing of Richard Cromwell, he went poſt to Ireland, to carry the news to his brother Henry Cromwell, and to concert with him what to do in order to maintain themſelves in their poſts. When, however, he perceived that king Charles the Second's intereſt was likely to prevail, he endeavoured to inſinuate himſelf into his favour. For this purpoſe he ſent to the king ſir Arthur Forbes, "to aſſure his majeſty of ſir Charles's affection and duty, and that if his majeſty would vouchſafe to come to Ireland, he was confident the whole kingdom would declare for him; that though the preſent power in England had removed all the ſober men from the government of the ſtate in Ireland, under the character of preſbyterians; and had put Ludlow, Corbet, and others of the king's judges in their places, yet they were generally ſo odious to the army as well as to the people, that they could ſeize on their perſons, and the caſtle of Dublin when they ſhould judge it convenient." The king did not think it prudent to accept the invitation. In a ſhort time after ſir Charles Coote, and ſome others, ſo influenced the whole council of officers, that they prevailed upon them to vote not to receive colonel Ludlow as commander in chief; they, moreover, made themſelves maſters of Athlone, Drogheda, Limerick, Dublin, and other important places for the ſervice of the king. He immediately cauſed colonel Monk to be made acquainted with the progreſs of the king's intereſt in Ireland, who urged them by every means not to reſtore the ſuſpended commiſſioners to the exerciſe of their authority. Soon after, ſir Charles Coote and others ſent to the parliament a charge of high treaſon, againſt colonel Ludlow, Corbet, Jones, and Thomlinſon. He likewiſe made himſelf maſter of Dublin-caſtle; and apprehended John Coke, chief juſtice of Ireland, who had been ſolicitor-general at the trial of king Charles I. Notwithſtanding this, parliament thought themſelves ſo ſure of him in their intereſt, that he received their vote of thanks on the 5th of Jan. 1659—60. On the 19th of the ſame month he was appointed one of the commiſſioners for the management of the affairs of Ireland. Before thoſe commiſſioners declared for king Charles, they inſiſted upon certain things relating to their intereſt as members of that nation. On the 6th of September 1660, ſir Charles Coote, on account of his many and very valuable ſervices for the royal cauſe, was created baron and viſcount Coote, and earl of Montrath in the queen's county. He was alſo appointed one of the lords juſtices of Ireland, but he did not long enjoy theſe marks of his ſovereign's favour, for he died in December 1661, and was ſucceeded in his eſtate and titles by his ſon Charles, the ſecond earl. Dr. Leland aſſerts that Coote and his father had engaged in the parliamentary ſervice not from principle, but intereſt. Dr. Kippis, however, doubts the aſſertion upon the ground that the Cootes were zealous preſbyterians, and therefore he thinks it highly probable that they were influenced, at leaſt in part, by their real ſentiments, civil and religious, and eſpecially by their averſion from popery.—Biog. Britan.

COOTE-HILL, in *Geography*, a market and poſt town of the county of Cavan, Ireland, near the borders of Monaghan. It was much neglected by the late proprietor, but the preſent one is improving its appearance by public buildings, ſuch as a market-houſe and ſhambles; and by obliging tenants to build on a plan adopted by him. It contains ſix houſes of worſhip, beſides the pariſh-church. In the ſale of its markets it is the moſt conſiderable town in the county. The ſale of linen alone averages 4000 *l.* weekly, principally of ſheetings, in which branch no market in Ireland

land can vie with it. It is fifty-three Iriſh miles N.W. from Dublin, and ten miles N.E. from Cavan. Coote's ſurvey of Cavan, &c.

COOTS-TOWN, a town of America, in the ſtate of Pennſylvania and county of Berks, is ſituated on a branch of Sauhoca creek, which is itſelf a branch of the Schuylkill river. It contains forty houſes, and a German Lutheran and Calviniſt church. It is diſtant ſeventeen miles N.N.E. from Reading, and ſeventy-three N.W. by N. from Philadelphia.

COOTWYCK, or KOOTWYCX, JURIAN, in *Biography*, a goldſmith, born at Amſterdam in 1714, who applied himſelf after the example of his countryman Ploos Van Amſtel, to the imitation of drawings by means of etching and aquatinta Amongſt his works, are ſeveral prints from the deſigns of Backhuyſen, Berghem, and other Dutch and Flemiſh maſters; and likewiſe ſome, which it is ſuppoſed he executed from ſketches of his own. One of his prints in imitation of black and white chalk, repreſenting an old woman ſitting in a chair, with a paper in her hand, is dated 1748. Heinecken.

COP, WILLIAM, born at Bale in Switzerland, took his degree of doctor in medicine at Paris, in the year 1495, and ſoon became ſo diſtinguiſhed by his ſuperior knowledge and abilities, that Ramus, no incompetent judge, called him, "Unica nobilium medicorum gloria." He was phyſician to Lewis the twelfth, and to Francis the firſt, and ancient to the Faculty of Medicine at Paris. He tranſlated the work of Paulus of Ægina, de Ratione Victus, which was publiſhed at Paris in the year 1510, in 4to.; and the following year at Straſburg; alſo, Galen's ſix books, de Locis Affectis, et de Morborum Cauſis et Differentiis, and the Prognoſtics of Hippocrates. He died in 1531. His ſon Nicholas ſucceeded him as regent of the Univerſity of Paris, but giving into the errors, his biographer ſays, of Calviniſm, he was obliged to leave Paris, and to paſs the latter part of his life at Bale. Haller Bib. Med. Eloy. Dict. Hiſt.

COPÆ, in *Ancient Geography*, town of Greece, in Bœotia, ſituated on the north banks of the lake Copais, to which it gave name. It is mentioned by Strabo, Ptolemy, and Pliny; the latter of whom ſays, that cars were invented in this place. It had temples of Ceres, Bacchus, and Serapis.

COPAIBA BALSAM, in the *Materia Medica*. See BALSAM.

COPAIFERA, in *Botany*, (from Copaiva, the Indian name, and *fero*, to bear.) Linn. Gen. 542. Schreb. 757. Willd. 880. Juſſ. 365. Vent. 3. 430. Copaiba; Marg. Piſ. Ray. Copaiva; Jacq. Copaier; Encyc. Claſs and order, *decandria monogynia*. Nat. Ord. Undetermined by Linnæus. *Leguminoſæ*; Juſſieu, with a doubt whether it be not more nearly allied to his next order, *Terebintaceæ*.

Gen. Ch. *Cal.* none. *Cor.* Petals four, oblong, acute, concave, widely ſpreading. (Calyx with four diviſions. Corolla none; or petals numerous, caducous? Juſſ.) *Stam.* Filaments ten, filiform, incurved, a little longer than the corolla; anthers oblong, incumbent. *Piſt.* Germ ſuperior, rounded, compreſſed-flattiſh, pedicelled; ſtyle filiform, curved, the length of the ſtamens: ſtigma obtuſe. *Peric.* Legume egg-ſhaped, pointed with part of the ſtyle, two-valved. *Seed* ſingle, egg-ſhaped, involved in a berried aril; (Incloſed in a pulpy envelope; Lam.)

Eſſ. Ch. Calyx none. Petals four. Legume egg-ſhaped. Seed ſingle, in a berried aril.

Sp. C. *officinalis*. Balſam of capevi tree. Linn. Sp. Pl. Jacq. Amer. 133. tab. 86. Pict. 67. 123. Lam. Ill. 342. Woodv. Med. Bot. tab. 137. A lofty tree with a handſome head; the ſmaller branches zig-zag, with a nearly ſmooth, browniſh aſh-coloured bark. *Leaves* alternate, winged, about four inches long; leaflets ſix or eight, peticled, lanceolate-egg-ſhaped, quite entire, ending in a blunt point narrower on one ſide than on the other, ſhining, ſomewhat coriaceous, not exactly oppoſite, one of the uppermoſt frequently wanting. *Flowers* white, on ſhort peduncles; in ſolitary axillary panicles at the ſummit of the branches, which conſiſt of about eight alternate, ſpreading racemes. A native of Brazil, Guiana, and New Spain, frequent about Tolu, ſixty leagues from Carthagena, growing promiſcuouſly among the trees which yield balſam of Tolu, Peru, &c. By a deep inciſion through the bark into the wood of the tree, a fluid balſam or reſin is obtained, which gradually thickens when expoſed to the air. For its chemical and medical properties, ſee the article *Copaiba* BALSAM.

COPAIS, in *Ancient Geography*. a lake of Bœotia; Strabo ſays that it had different names from the towns that were ſituated near it; thus it was called Copais, from Copæ; Haliartos, from Haliarte. It is alſo called Leuconis by Steph. Byz.; and Cephiſſis by Pauſanias. Its preſent name is "Lagordi Topoglia." This lake was 380 ſtadia, or 14⅓ leagues in circumference, and ſerved as a common receptacle for the rivers which iſſued from the mountains by which Bœotia was ſurrounded. As this lake had no apparent outlet, it muſt have overflown the country, if nature, or rather the induſtry of man, had not contrived ſecret paſſages for draining off the water. In the part adjoining to the ſea, the lake terminates in three bays, which advance to the foot of mount Ptous, ſituated between the ſea and the lake. From the bottom of each of theſe bays, diverge a number of canals, that traverſe the mountain through its whole breadth, ſome of which are thirty ſtadia, or more than a league in length, and others of a much greater extent. To excavate or cleanſe them, wells had been ſunk at ſtated diſtances on the mountain, which are of a very great depth. The formation of theſe wells muſt be traced to the moſt remote antiquity, as no traditional or hiſtorical account of their origin exiſts. It requires great labour and expence to maintain them; and as moſt of them have been choaked up, the lake has proportionally gained on the plain.

It is not improbable that the deluge, or rather the inundation which happened in Bœotia, in the time of Ogyges, was cauſed merely by the obſtruction of the water in theſe ſubterraneous conduits.

COPAL. This valuable and ſingular kind of reſin is imported partly from South America, and partly from the Eaſt Indies, and like moſt of the other reſins, is a natural exſudation from a large tree, which hardens in the air.

The beſt copal is a hard brittle reſin, in rounded lumps of moderate ſize, eaſily reducible to fine powder, beautifully tranſparent, but often, like amber, containing parts of inſects and other ſmall extraneous bodies impacted in its ſubſtance.

The colour of copal is a light lemon yellow, varying to orange; but when diſſolved and thinly ſpread over any ſurface, the colour is ſcarcely perceptible, and it only gives a fine hard, ſmooth, tranſparent glazing. It is this union of hardneſs and tranſparency, with want of colour, that renders copal ſo valuable as a varniſh.

Copal unqueſtionably belongs to the claſs of reſins, but it differs from moſt of theſe ſubſtances in the great difficulty with which it diſſolves in alcohol and eſſential oils, ſo as to require great purity of theſe menſtrua and particular management.

The three menſtrua uſually employed in varniſhing, are alcohol, oil of turpentine, or any other eſſential oil, and drying

drying linſeed, or other fixed oil. Theſe are uſed ſometimes ſeparately with the varniſh reſins, but generally mixed.

We ſhall give ſome of the proceſſes by which copal may be diſſolved in each of theſe ſubſtances.

Alcohol ſingly, which ſo readily diſſolves the other reſins, has but little action on copal; for if this reſin in fine powder be digeſted with the very pureſt alcohol, with or without heat, ſcarcely any of it is diſſolved, and the copal coaleſces at the bottom of the veſſel into a tough coheſive maſs. But a ſolution may be effected by the addition of *camphor*, the action of which, upon the reſins, has been partly deſcribed under that article. With none is it more ſtriking than with copal. When the two are ſeparately powdered and mixed, the copal abſorbs the camphor, ſwells and ſoftens into a paſty maſs, which will remain for months of the ſame conſiſtence, without hardening. To make an alcoholic ſolution of copal, diſſolve half an ounce of camphor in a pint of highly rectified alcohol; put it in a glaſs veſſel over a lamp, and add four ounces of copal in ſmall pieces, and continue the heat juſt to that degree at which the bubbles may be counted, till the ſolution is compleat. Part of the copal ſeparates when cold, but moſt of it remains in permanent ſolution.

It is neceſſary firſt to diſſolve the camphor in the alcohol; for, if the paſty maſs ariſing from the mixture of copal and camphor be added to alcohol, the ſolution will not go on.

A mixture of maſtich, elemi, and other reſins, will bear a moderate quantity of copal, without being rendered inſoluble in alcohol, even without the aſſiſtance of camphor.

To diſſolve copal in the eſſential oils, Mr. Sheldrake has given the following proceſs in the Tranſactions of the Society of Arts.

Reduce two ounces of copal to *coarſe* powder; put it into a glaſs veſſel, and pour thereon a pint of the *very beſt* oil of turpentine, with one eighth of ſpirit of ſal ammoniac, previouſly well ſhaken. Cork the glaſs, leaving a pin-hole through the cork to allow of the eſcape of vapour, and ſpeedily heat it to that point at which the bubbles may be counted. Continue this till the ſolution is complete, taking care not to increaſe the heat, otherwiſe the copal will coaleſce at the bottom of the glaſs, and the ſolution will not go on. The veſſel ſhould not be opened till quite cold. This liquor is of a rich deep yellow when in quantity, but when applied as a varniſh, it is nearly colourleſs. The ſpirit of ſal ammoniac is not a neceſſary ingredient.

Mr. Tingry of Geneva (Painter's and Varniſher's Guide, 1804,) finds that copal may be united to oil of turpentine by the intermede of ſome other of the eſſential oils, particularly oil of ſpike and lavender. He gives the following proceſs: Take two ounces of oil of lavender, heat it in a glaſs matraſs, add thereto an ounce of copal groſsly powdered, and, at different times, ſtirring the mixture with a ſtick of white wood. When the copal is diſſolved, add ſix ounces of oil of turpentine, nearly boiling, and ſtir the whole thoroughly. This gives a fine gold-coloured liquid, very fit for varniſhing.

Camphor alſo highly aſſiſts the ſolution of copal, in oil of turpentine, as it does in alcohol, and the ſame precaution is neceſſary, of diſſolving the camphor completely in the oil, before the copal is added. Half an ounce of camphor is ſufficient to a quart of the oil, to enable it to take up as much copal as will make a good varniſh.

To unite any of the reſins with drying linſeed oil in the compoſition of the oil varniſhes, it is neceſſary to expoſe them to a much greater heat than in the former inſtances, that is, not leſs than is ſufficient to liquefy the reſins. This, however, always gives the reſin a certain degree of brown colour, which is often injurious to it when uſed as a varniſh. Copal when melted with as little heat as poſſible, and then dropped into drying linſeed oil, diſſolves therein with eaſe, and this ſolution mixed with clear turpentine, forms a very fine hard varniſh. To avoid as much as poſſible the diſcolouration of the copal, Mr. Tingry incloſes it in a kind of wire-cage ſuſpended in a very ſlow well-regulated furnace; and, as ſoon as any portion melts, it falls in drops into the drying oil heated and ſet beneath it.

When melted copal is dropped into water, a ſmall quantity of oil is ſeparated, and floats at top, and the reſin at the bottom is thereby rendered ſomewhat more ſoluble in the different menſtrua.

Copal is liable to be confounded with gum anime, when the latter is very clear and good. The diſtinction is of ſome conſequence, as the anime, though valuable in varniſhing, is much leſs ſo than the fineſt copal, the varniſh with the former being darker coloured, and not ſo hard. Beſides the external appearance of each, which is pretty diſtinct to a practiſed eye, the ſolubility in alcohol furniſhes an uſeful teſt, the anime being readily ſoluble in this fluid, but the copal ſcarcely ſo.

COPALLI, in *Botany*, Hernand. See RHUS *copallinum*.

COPAR, in *Ancient Geography*, a village of Arabia Felix, according to Ptolemy.—Alſo, a place of Paleſtine, in the vicinity of Cæſarea Philippi.

COPARCENARY, the ſhare, or quota, of a coparcener.

COPARCENERS, from *con*, and *particeps*, *partner*; or parceners; ſuch as have equal portions in the inheritance of their anceſtor.

Coparceners are ſo either by *law*, or *cuſtom*. Coparceners *by common law*, are the iſſue female; which, in default of a male heir, come equally to the lands of their anceſtor: thus, when a perſon ſeiſed in fee-ſimple or in fee-tail dies, and his next heirs are two or more females, his daughters, ſiſters, aunts, couſins, or their repreſentatives; in this caſe they ſhall all inherit, and theſe co-heirs are then called coparceners or parceners.

Coparceners *by cuſtom*, are thoſe who, by ſome peculiar cuſtom of the country, challenge equal parts in ſuch lands; as in Kent, by the cuſtom of gavelkind, according to which lands deſcend to all the males in equal degree, as ſons, brothers, uncles, &c. In either of theſe caſes, all the parceners put together make but one heir, and have but one eſtate among them. Co. Litt. § 241, 242, 265; and 163. The crown of England is not ſubject to coparcenary.

COPARTNERSHIP. See PARTNERSHIP.

COPAS, in *Ancient Geography*, a river of Aſia Minor, in Caria.

COPATZ, in *Geography*, a town in the iſland of Cherſo; 8 miles N. of Cherſo.

COPE, an eccleſiaſtical ornament, uſually worn by chantors and ſub-chantors, when they officiate in the church-ſolemnity. It is alſo worn by the Romiſh biſhops, and other ordinaries: it reaches from the ſhoulders to the feet. The ancients called it *pluviale*.

In the trial of archbiſhop Laud, one of the charges alleged againſt him was his introducing the uſe of copes and church muſic into divine worſhip. To this charge he replied,

plied, that the uſe of copes is preſcribed by the 24th canon of 1603, which ſays, "that in all cathedrals and collegiate churches, the communion ſhall be adminiſtered on principal feaſt-days, ſometimes by the biſhop, if preſent, ſometimes by the dean, and ſometimes by the canon or prebendary, the principal miniſter uſing a decent cope;" ſo that in this reſpect he had made no innovation.

To this defence it was replied, that neither the common-prayer book, nor book of ordination, nor homilies confirmed by parliament, nor queen Elizabeth's injunctions in her firſt year, make any mention of copes, though they are evidently derived from the popiſh wardrobe; and the laſt common-prayer book of king Edward VI. expreſsly prohibits them. The 24th canon of 1603 enjoins only the chief miniſter to wear a cope at the adminiſtration of the ſacrament, whereas the archbiſhop preſcribed them to be worn by others beſides the chief miniſter, and as well when the ſacrament was not adminiſtered as when it was. But theſe canons not being confirmed in parliament, expired with king James, and therefore could be no warrant for their preſent uſe.

Cope, in *Biography*, a Flemiſh ſculptor of the 16th century, who reſided at Rome, and is celebrated by Baglione for the beautiful baſſo-relievos which he modelled, in a ſmall ſize, from the Fables of Ovid; and which were afterwards caſt in gold and ſilver, for the purpoſe of ornamenting the magnificent furniture of thoſe times. The above-mentioned author informs us, that impreſſions from theſe beautiful models were generally diſperſed and much admired at Rome. From Baglione's deſcription of theſe works, we might be led to conjecture, that many of thoſe ſmall baſſo-relievos in bronze, which are uſually attributed to Benvento Cellini, are no other than caſts from theſe models of Cope. He is ſaid to have ſucceeded in ſome ſmall productions in ivory; and, ultimately, to have attempted a ſtatue of a larger ſize in marble, which, however, after a long and fruitleſs labour, he left unfiniſhed. He was not leſs remarkable for his talents, than for his moroſe and unſocial diſpoſition, and he died miſerably at about the age of 80, in the pontificate of Paul V. Baglione.

Cope, *St. Martin's*, was a relic formerly in great eſteem among the French kings; and was often carried with them to war as their ſtandard.

Cope, among *Miners*, is a cuſtom or tribute due to the king, or lord of the ſoil, out of the lead mines in ſome part of Derbyſhire. This duty amounted, according to Manlove, to ſixpence a load, nine diſhes making one load.

COPEC, in *Commerce*, a Muſcovite coin, valued at about a half-penny; ſo that 100 copecs are equal to a ruble, which is valued at an average at 4*s*.

COPE-STAKE, a German coin, valued at 12*d*. ſterling.

COPENHAGEN (in Latin *Hafnia*, in Daniſh *Kiobenhavn*, originally *Kiobmandſhavn*, the *Merchants' harbour*), in *Geography*, is the capital of the kingdom of Denmark, ſituated on the eaſtern ſhore of the iſland of Zealand, in a bay of the Baltic ſea, about 24 Engliſh miles from the Sound. E. long. 12° 35′ 15″. N. lat. 55° 41′ 4″, 160 miles N.E. of Hamburgh, and 240 S.W. of Stockholm. Its circumference is from 4 to 5 Engliſh miles.

In the 11th century Copenhagen was only a mean fiſhing place. It owed its increaſe to a caſtle, which protected its inhabitants againſt the numerous pirates who infeſted the Baltic ſea. Leyre, or Lethra, of which ſome remains have been found near Roſchild, had been the reſidence of the Daniſh kings till the year 950, when that diſtinction was beſtowed on Roſchild itſelf, from whence the ſeat of empire was transferred to Copenhagen, in 1443, during the reign of Chriſtopher of Bavaria. From that time the kings of Denmark have conſtantly reſided at Copenhagen.

This city was always well fortified by nature and art, but the ſtrong citadel of Frederickſhavn, between the harbour and the eaſt gate, was only erected in 1663, previous to which time Copenhagen had often been attacked. In the year 1523 it was beſieged by Frederick, duke of Gottorp, ſupported by a fleet from Lubeck, conſiſting of ten ſhips of war. Preſſed by famine, and cut off from all hopes of relief, the citizens ſurrendered, after a cloſe ſiege of ſeven months. Thirteen years after, when, on the death of Frederick, the inhabitants attempted to replace their old and favourite king Chriſtian II. on the throne, Copenhagen underwent the ſame fate.

In 1658, Charles Guſtavus, king of Sweden, having led his army over the ice, overran Denmark, and in the month of Auguſt appeared before Copenhagen, whilſt his fleet blockaded the harbour. Bombs and red-hot balls were thrown into the city, but the fire was immediately extinguiſhed by the activity of the inhabitants. However, in the month of October of the ſame year the Dutch fleet, under the command of admiral Opdam, came to the aſſiſtance of the beſieged, defeated the Swediſh fleet, and threw a large ſupply of proviſions into the town. Charles Guſtavus at length ventured a general aſſault in the night between the 11th and 12th of February 1659, when the ditches about the ramparts were thickly frozen. The chief attack was directed againſt the weſtern rampart which the citizens and ſtudents defended with ſuch obſtinacy, that the Swediſh monarch, giving up all hopes of taking the city, retired, and the year following concluded a peace. As a reward for their bravery, the citizens and ſtudents obtained privileges which they enjoy at this day.

During the reign of Frederick IV. in the year 1700, Copenhagen was again beſieged on the land ſide by a Swediſh army under the command of the renowned Charles XII. and on the ſea ſide by the combined fleets of Holland, England, and Sweden. The Daniſh king was in Holſtein, but the queen dowager, Charlotte Amelia, having animated the citizens and ſtudents to a brave reſiſtance, neither the numerous Swediſh army, nor the combined fleets, could make any impreſſion on the town. The peace of Travendahl put an end to the ſiege, and Copenhagen enjoyed a complete century of uninterrupted peace.

On the 2d of April, 1801, the Engliſh vice-admiral, Nelſon, with 11 ſhips of the line, 7 frigates, and 19 ſmall veſſels, attacked the line of defence before the port of Copenhagen, and, after a moſt obſtinate engagement of three hours and a half, unfurled the white flag, took poſſeſſion of 11 Daniſh ſhips, and, by an equally well-timed and ſkilful negociation, detached Denmark from the maritime league into which ſhe had entered with Ruſſia and Sweden againſt England. The harmony between the two countries was reſtored, but continued only until the month of Auguſt 1807, when a ſtrong Engliſh fleet encircled the iſland of Zealand, having previouſly diſembarked an army of nearly 20,000 men, under the command of lord Cathcart, which inveſted Copenhagen by land. After a vigorous bombardment of five days and nights, during which Copenhagen made a defence worthy of the acknowledged bravery of the Danes, and the citizens and ſtudents diſplayed the moſt undaunted courage, a capitulation was agreed upon on the 7th of September, by which the Engliſh troops were allowed to take poſſeſſion of the citadel for ſix weeks, and the whole Daniſh navy, conſiſting of 18 ſail of the line, 15 frigates, 6 ſloops, and 25 gun-boats, together with all the ſtores of the naval arſenal of Chriſtianſholm, were ſurrendered to the diſpoſal of the king of Great Britain.

On this occaſion Copenhagen ſuffered ſeverely. In the night of the 4th of September the grand ſteeple of St. Mary's, or our lady's church, which was 380 feet high, and ſtood on the higheſt ſpot in the city, was ſet on fire, and after having blazed for four hours, fell with a moſt tremendous craſh. From ſix to ſeven hundred buildings, beſides thoſe of the univerſity and one hoſpital, were burnt to the ground; thouſands were damaged, and no more than four hundred houſes eſcaped unhurt. Several valuable libraries fell a prey to the flames, and five or ſix hundred peaceable inhabitants were killed or maimed.

Anciently, Copenhagen had often been viſited by the plague. The laſt which raged, in 1711, ſwept away great numbers of the inhabitants. In more recent times, Copenhagen has been frequently expoſed to terrible conflagrations. On the evening of the 20th of October 1728, a fire broke out in a low houſe, not far from the weſt-gate, which ſpread with ſuch fury, that in eight-and-forty hours the moſt elegant part of the city was laid in aſhes; 1650 dwelling houſes, four churches, the univerſity buildings, and ſeveral other public edifices were burnt down to the ground. On the 26th of February 1794, the church of St. Nicholas, and the royal palace of Chriſtianſburg, the gorgeous magnificence of which is ſufficiently atteſted by its ſtupendous remains, were deſtroyed by fire, and hardly had the private houſes, which ſuffered in this dreadful calamity, been rebuilt, when another conſiderable part of the city was reduced to aſhes in 1795.

Theſe conflagrations contributed, however, to render Copenhagen one of the fineſt cities in the north. The houſes, though moſtly of brick ſtuccoed, exhibit a beautiful and uniform appearance, the ſtreets are furniſhed with lamps; well paved, with a foot way on each ſide, and running in a ſtraight line; but ſome of the ſtreets are rather too narrow.

Copenhagen is divided into the Old and New Town and Chriſtianſhafen. The *Kongens nye Torge*, or king's New Market, which connects the Old with the New Town, is a ſpacious, irregular area, embelliſhed with an equeſtrian ſtatue in bronze of Chriſtian V., and adorned with ſeveral handſome buildings, among which are the palace of Charlottenburg, devoted in part to the Royal Academy of painting, architecture, and ſculpture; and the theatre, which, though ſmall, is neat and elegantly decorated within. In the New Town is a beautiful octagon, containing four uniform and elegant buildings, in two of which the royal family reſided ever ſince the palace was burnt down. In the middle of the octagon ſtands an equeſtrian ſtatue of Frederick V. in bronze.

Chriſtianſhafen is built on the iſland of Amack, and connected with the Old Town by two bridges. Beſides the fine dock-yards, where the men of war are refitted, Chriſtianſhafen contains the great Weſt India ſugar houſe and the Eaſt India houſe. The iſland of *Amack* itſelf is conſidered as the kitchen garden of Copenhagen, and furniſhes the ſame with greens, fruit, milk, butter, and cheeſe in abundance. It is 9 miles long and about 2½ miles in breadth. It contains above 800 families or 4000 ſouls, and is divided into two pariſhes, Taarnebye which is inhabited by Danes and Dutchmen, and Hollanderbye inhabited only by the deſcendants of a Dutch colony, which king Chriſtian II. tranſplanted hither from North Holland, in 1516, at the requeſt of his wife Elizabeth, ſiſter to Charles V. who was a native of the Low Countries. The language of the inhabitants of Amack is ſtill a mixture of Daniſh and Low Dutch. They have preſerved their particular dreſs, manners, and cuſtoms. The men wear broad brimmed hats, black jackets, full glazed black breeches, looſe at the knee; the women black jackets, red petticoats, and a piece of blue glazed cloth bound round their heads. There is a particular market place at Copenhagen for the peaſants of Amack, called the Amacker market.

The harbour of Copenhagen, formed by the ſtraits of Kelleboe, between the iſlands of Zealand and Amack, is capable of holding 500 ſhips. It is protected by ſeveral batteries, of which that of the three crowns is the moſt formidable. The naval arſenal, called Chriſtianſholm, is much ſuperior to that of Venice. The forges, workſhops, rope-walks, are upon an admirable conſtruction. Each ſhip has her ſeparate magazine, containing all the materials for her equipment. The ſeamen are regiſtered and divided into two claſſes; thoſe who in time of peace are permitted to ſerve on board the merchants' ſhips, or to enter into foreign ſervice, ſubject to be recalled in caſe of war, and the ſtationary ſailors who are always in the employ of the crown. The latter, 4000 in number, live in barracks at Copenhagen. The academy of marine cadets forms one of the palaces in the octagon of the New Town. It was founded in 1701, for the education of fifty young gentlemen, who are boarded and inſtructed gratis; but more are admitted, on paying, to ſhare in their inſtruction. They have to paſs through ſeveral ſevere examinations before they are entered as midſhipmen in the king's ſhips.

Copenhagen is the chief commercial town of all Denmark. Its principal domeſtic trade is with Norway, Iceland, the Faro iſlands, and Greenland. Since the year 1754, the trade to the Weſt Indies is free to all the Daniſh ports; yet Copenhagen receives, almoſt excluſively, the return cargoes from St. Croix, St. Thomas, and St. John. Copenhagen is alſo the ſeat of an Eaſt India Company, a Jiro Bank, an Inſurance Company; and its extenſive foreign trade is chiefly with Germany, the countries round the Baltic, and the Mediterranean ſeas, France, Portugal, and Spain. In the year 1792, Copenhagen had only 218 ſhips of about 24,000 tons, but during the long wars between France and England their number has been nearly doubled.

The moſt important manufactures of Copenhagen are the woollen cloth and ſtuff, the calico-printing, ſilk, and China manufacture. The latter, though in its infancy, is thought to rival thoſe of Dreſden and Berlin.

Copenhagen is the ſeat of an univerſity founded in 1475. It is richly endowed, grants a ſupport of 4 marks Daniſh, or nearly 3 ſhillings Engliſh, a week to 180 poor ſtudents, and ſince the year 1791 diſtributes eight premiums annually for the beſt anſwer to eight prize queſtions. There are four colleges, in which 168 ſtudents are provided with lodging, fire wood, and pecuniary ſtipends. The number of ſtudents is generally between five and ſix hundred.

Since the year 1742, ſeveral learned aſſociations have been formed at Copenhagen, the oldeſt and moſt known of which is the Royal Society, whoſe reſearches have thrown great light on northern hiſtory. This ſociety ſuperintends alſo the geographical menſuration of the country, and the publication of new ſpecial maps. It propoſes four queſtions annually, and the prize for each is a gold medal worth twenty pounds ſterling. But beſides the Medical Society, founded in 1772, that of Icelandic literature, founded in

1779, and that of natural hiſtory, founded in 1789, the moſt important is the Royal Economical Society, founded in 1768, whoſe annual income of 6000 dollars, or 1200*l.* ſterling, is expended in promoting the fine arts, fiſheries, agriculture, and horticulture, and in encouraging every attempt that tends to benefit the country. It is now endeavouring to eſtabliſh a regular importation of coals from the Faro iſlands. There is alſo a board of longitude and a repoſitory for marine charts, founded in 1784, which has publiſhed excellent charts of the entrance of the Sound, of the two Belts, the Sound and the Baltic as far as Bornholm, of the Cattegat, of part of the weſtern coaſt of Iceland, of part of the eaſtern coaſt of Iceland, of the Faro iſlands, and ſix charts of the coaſt of Norway. Copenhagen has likewiſe acquired ſome celebrity from its royal muſeum or cabinet of curioſities remarkable for Laplandiſh dreſſes, implements, and arms; from its excellent theatre of anatomy, founded in 1736, and from its public royal library, which, in 1797, was increaſed with the celebrated Suhm's library of 50,000 volumes, collected by himſelf, and relating chiefly to the antiquities of northern Europe.

There is only one theatre at Copenhagen, which is partly ſupported by the court. During the year 1806, it brought out nine tranſlated pieces, and only one original Daniſh comedy. The performances of the ſeaſon amounted to 158. There has been no Italian opera of late; only occaſionally, and for a ſhort time, German and French plays are performed by itinerant companies.

Copenhagen is the ſeat of a ſupreme tribunal, which is the higheſt court of juſtice for all the Daniſh dominions. Its ſittings are opened with great ſolemnity in the beginning of March, on the ancient *Herredag* or *Danehoev* (meeting of parliament) by the king himſelf. And beſides the inferior courts of juſtice there are *boards of conciliation*, or rather *conciliatory committees*, whoſe duty it is to accommodate matters between the parties by all poſſible means of perſuaſion. If an accommodation takes place, the expences are very trifling, and the parties are bound to abide by it. From the 13th of Auguſt, 1795, when the firſt conciliatory committee was eſtabliſhed at Copenhagen till the 31ſt of December 1801, 13,223 litigations were prevented at Copenhagen only in the courſe of ſix years and a half.

The biſhop of Zealand, who is firſt in rank among the twelve biſhops, of whom the Daniſh hierarchy is compoſed, reſides at Copenhagen, which, beſides the cathedral, counts 20 churches, one French proteſtant church, and ſeveral ſynagogues for the Jews, whoſe number amounts to 1500. They are moſt liberally treated at Copenhagen, and there is even a ſociety eſtabliſhed by Chriſtians for the purpoſe of encouraging the inſtruction of Jews in arts and handicraft-trades.

In 1714, Frederick IV. eſtabliſhed at Copenhagen a board of miſſions or *Collegium de Curſu evangelii promovendo*, which ſends miſſionaries to Greenland, and to the Eaſt Indies. The latter are alſo ſupported in part by contributions collected at London. In the beginning of 1807, Copenhagen, with its ſuburbs, counted 3156 houſes, and 104,000 inhabitants. The regiſters for the year 1806, gave 3440 born, 3109 dead, and 930 couples married. In 1799, Copenhagen counted only 82,608 inhabitants, one-ſixteenth, or 5163, of whom were paupers. Yet no beggars are ſeen in the ſtreets. A board of alms watches over the poor, who are provided for by voluntary contributions. Copenhagen has twenty-two hoſpitals, and thirty poor-houſes. In 1802, the principal infirmary admitted 2349 patients, 1813 of whom were cured, 218 died, and 318 remained in the houſe. The naval hoſpital, or *Quatſch-houſe*, contains 300 invalid ſailors.

The police at Copenhagen is vigilant and good. A paper publiſhed weekly, under the title of the *Friend of the Police*, has particularly contributed to render the police excellent, by pointing out the moſt minute objects with regard to which it was thought deficient. Since the year 1804, the priſons have been rendered much more comfortable. They are all wainſcotted and boarded, provided with bedſteads, blankets, and mattreſſes; and no perſon, whatever may be his crime, is ever confined in a dungeon or cellar. In the Raſp-houſe, where capital offenders are ſhut up for life, the male convicts raſp and ſaw Brazil wood, the females ſpin, and thus they all contribute towards their ſupport by their labour. There is alſo a board of health, and a committee for promoting vaccination, under whoſe ſuperintendance 6489 individuals were inoculated for the cow-pox at Copenhagen, in the courſe of the year 1802.

Copenhagen is ſurrounded with country ſeats, which offer the moſt enchanting ſea-views. Its environs are beautiful, the country being finely varied with ſmall foreſts of beech and oak. Of the ſummer-palaces in its neighbourhood, *Frederickſberg* is the moſt remarkable for its delightful ſituation.

Without the weſtern gate, cloſe to Copenhagen on the high road, ſtands an intereſting monument in commemoration of the emancipation of the peaſants, which was effected under the preſent king. Four figures of white marble, repreſenting peace, plenty, content, and induſtry, occupy the four corners of a pedeſtal, from the centre of which riſes a pyramid. On one ſide of the baſe are theſe words: "For Chriſtian den ſyvende de Danſkes og Norges Konge af eenige og taknemmelige Borgere." To Chriſtian the Seventh king of the Danes and Norwegians from united and grateful citizens; and on the other, "Grund ſteenen blev lagt af Frederik kongens ſon, folkets ven 1792." The foundation ſtone was laid by Frederic the king's ſon, the friend of the people.

A. Anderſon's Tour in Zealand, in the year 1802. Buſching. I. 85. Coxe's Travels, fifth edition, vol. v. p. 97. Catteau's Tableau du Danemarck. Sir John Carr's Northern Summer, p. 42. Fr. Thaarup's Statiſtik der Dæniſchen Monarchie. 1796.

COPERARIO, Giovanni, or John Cooper, in *Biography*, an Engliſh muſician, who, having reſided for ſome time in Italy, on returning to his native country, Italianized his name, and became a favourite performer on the lute and viol du gambe, and a voluminous compoſer of *fantaſie*, fancies, for viols, in three, four, five, and ſix parts. He was appointed muſic-maſter to the children of James I.; and prince Charles, under his inſtruction, made a conſiderable progreſs on the viol. Some of his vocal compoſitions were printed in the muſical publications of the times. In conjunction with Nicholas Laniere, and others, he compoſed the ſongs in a Maſque, written by ſir Thomas Campion, on the marriage of Carr, earl of Somerſet, and lady Frances Howard, the divorced counteſs of Eſſex, which was performed in the Banquetting Room at Whitehall, on St. Stephen's night, in the year 1604. Mr. Fenton, in his notes on Waller, ſays, that Henry Lawes, having been educated under him (Coperario), "introduced a ſofter mixture of Italian airs than had before been practiſed in this country;" from which, and from his giving him the title of *Signor*, he ſeems to intimate, that he regarded him as an Italian. The following are the titles of his printed works, excluſive of the ſongs which he compoſed in conjunction with Laniere: "Funeral Tears for the Death of the Right Hon. the Earl of Devonſhire, figured in ſeauen Songes, whereof ſixe are ſo ſet forth that the Wordes may be expreſſed by a treble Voyce alone to the Lute, and baſe Viol, or elſe that the meane part may be added, if any ſhall effect more fulneſſe of parts. The ſeaventh is made in forme of a Dialogue, and cannot be ſung without two Voyces. Invented by John Coperario." Fol. London, 1606. 2. "Songs of Mourning, bewailing the untimely death of Prince Henry, worded by Thomas Campion, and ſet forth to bee ſung with one Uoice to the Lute or Violl, by John Coperario." Fol. Lond. 1613.

COPERNICAN Sphere. See Sphere.

Copernican *Syſtem*, is that ſyſtem of the world, wherein the ſun is ſuppoſed at reſt in the centre; and the planets, with the earth, to move in ellipſes round him.

The heavens and ſtars are here ſuppoſed at reſt; and that diurnal motion which they appear to have from eaſt to weſt, is imputed to the earth's motion from weſt to eaſt.

This ſyſtem was aſſerted by many of the ancients; and particularly Ecphantus, Seleucus, Ariſtarchus, Philolaus, Cleanthes Samius, Nicetas, Heraclides Ponticus, Plato, and Pythagoras; from the laſt of whom it was anciently denominated the *Pythagoric ſyſtem*.

It was alſo held by Archimedes, in his book De Granorum Arenæ Numero; but after him it became neglected, and even forgotten, for many ages; till above three hundred years ago, when Copernicus revived it; from whom it took the new name of the *Copernican ſyſtem*. See Copernicus.

COPERNICUS, Nicholas, or rather Copernick, in *Biography*, the celebrated aſtronomer, was born at Thorn in Pruſſia, near the Old Gate, on the 19th of February, 1473, [illegible] which was ſtill extant in 1797, and ſhewn to ſtrangers as one of the greateſt curioſities of that town. His father was a ſurgeon; his mother's brother, *Lucas Walzelrodt*, or, as he is ſometimes called, *Waiſſelrodt Von Alten*, was, ſome years after young Copernicus's birth, raiſed to the dignity of biſhop of Ermeland, in Latin, Epiſcopus Varmienſis: which circumſtance has betrayed moſt of the Engliſh biographers into a ſingular miſtake. They make Copernicus canon of Worms, in the ſouth of Germany, inſtead of Frauenburg in Pruſſia, which is the ſee of the biſhops of Ermeland.

Copernicus received his firſt inſtructions in the grammar ſchool of his native city, from whence he was ſent to ſtudy phyſic at the univerſity of Cracow, where he gained the academical honour of a doctor's diploma. But he never practiſed as a phyſician, though he readily gave his advice, and his medicines, without any fee, to thoſe friends who conſulted him. Mathematics were his favourite ſtudy: and he took particular delight in the ſtudy of perſpective; and this induced him to acquire the art of painting, in which he is ſaid to have excelled. From the inſtant he had heard Albert Brudzevius's mathematical lectures at Cracow, he was fired with the noble ardour of emulating the two greateſt mathematicians of his time, George Purbach, an Auſtrian, and John Regiomontanus, a native of Königſberg, in the Newmark of Brandenburg. To accompliſh this arduous deſign, he went to Italy, and was at firſt the pupil, but ſoon became the friend and aſſiſtant, of Dominicus Maria, of Ferrara, who was then teaching mathematics at Bologna, and whoſe hypotheſis about the variability of the axis of the globe, by exciting univerſal attention, gave Copernicus the firſt ideas of the motion of the earth. At Bologna, in the year 1497, Copernicus firſt obſerved the occultation of Palilitium by the moon.

He left Bologna to teach mathematics at Rome, where he obſerved an eclipſe of the moon in the year 1500; and ſuch was his dawning celebrity, that, even after his return to Pruſſia, he was conſulted by the clergy of Rome, in the year 1516, reſpecting the improvement of the calendar. In the mean time his uncle, the biſhop of Ermeland, had made him a canon of the chapter of Frauenburg; and the town of Thorn had named him to the archdeaconry of the church of St. John: yet he ſeldom lived in his native city, but made Frauenburg his principal reſidence. Zealouſly attached to the tenets of his church, he fulfilled the duties of his clerical offices with punctual care. The glorious Reformation, which he witneſſed, had no influence on his religious opinions: his mind purſued a different tract. Drawing and painting, the ſtudy of perſpective, and the making of mathematical inſtruments, filled his leiſure hours; and beſides his regular avocations, the conſtruction of ſome aqueducts abſorbed his time. That which feeds the mill of Graudentz with water has been completely preſerved; of another, which ſupplied the hill of Frauenburg, on which the canons reſide, nothing remains but the tower on the banks of the Paſſarge, to the top of which he raiſed the waters of that river, and which exhibits ſtill the following inſcription:

> "Hic patiuntur aquæ ſurſum properare coactæ,
> Ne careat ſitiens Incola montis ope,
> Quod natura negat tribuit Copernicus arte,
> Unum pro cunctis Fama loquatur opus."

Whenever the biſhop was abſent, Copernicus was entruſted with the government of the dioceſe; and after the death of two prelates, he was appointed general vicar during the vacancy. He was alſo frequently deputed to the provincial diets. Nothing, however, could divert him from his original purpoſe. He applied his ſtores of mathematical knowledge to the improvement of aſtronomy. The garret of his houſe at Frauenburg, which is ſtill ſhewn, and the ſteeple of the cathedral, were his obſervatories. The epicycles and eccentrics of Ptolemy embarraſſed and perplexed him; but the hypotheſis of the earth being the motionleſs centre of the univerſe, was generally received: it had been adopted by Plato and Ariſtotle, whoſe authority was conſidered paramount to that of the bible; and Joſhua's command to the ſun and moon confirmed it. To attack this ſyſtem was incurring the imputation of hereſy; and it required no ordinary courage to advance an opinion, for which Galileo ſuffered a century after.

In this perplexity, Copernicus aſſiduouſly ſearched the lore of antiquity. He found that the Egyptians taught the revolution of Mercury and Venus about the ſun; that Apollonius and Pergæus had aſſigned the ſame motion to Mars, Jupiter, and Saturn; that, according to his diſciples, Nicetas and Heraclides, Pythagoras, whoſe learning was derived from the Egyptians, aſſerted the earth's motion round its own axis; and that Ariſtarchus and Philolaus went ſtill farther, and maintained that the earth did not only move about its axis, but employed twelve months in revolving round the ſun.

On theſe foundations Copernicus raiſed a ſtructure, of which his intenſe and acute ſtudy furniſhed him with the moſt correct mathematical evidence. According to his ſyſtem, the ſun occupies the centre of the univerſe; the planets, in their motion round him, deſcribe ellipſes proportioned to their ſize; Mercury moves round the ſun within three months, Venus within eight, the earth within twelve, and within four-and-twenty hours it revolves round its own axis; the moon is a ſatellite of the earth, about which ſhe turns thirteen times in a year; Mars takes two, Jupiter almoſt twelve, and Saturn nearly thirty, years to move about the ſun.

It was in the year 1530 that Copernicus laid the laſt hand to his ſyſtem, which he had begun to form about the year 1507; but he had not yet ventured to launch it into the learned world, when its fame reached the biſhop of Capoua, cardinal Nicholas Schönberg, who, in 1534, by a letter which does honour to his ſentiments, invited Copernicus to publiſh his new ſyſtem. Other great men, particularly Tindemann Gieſe, biſhop of Culm, aſſailed him with their intreaties to the ſame purpoſe. But his modeſty was ſtill reſiſting their preſſing application, when Rheticus, profeſſor of mathematics at Wittenberg, excited by an ardent thirſt of learning, reſigned his chair, and viſited Copernicus at Frauenburg, in the year 1539. To him Copernicus at laſt truſted his work, which, in 1543, was printed at Marienburg, at the expence of cardinal Schönberg, under the title of "Nicolai Copernici de Revolutionibus Orbium Cœleſtium, Libri vi." But he did not live to read his book in print. A copy of it reached him only a few hours before his death, which happened at Frauenburg, on the 22d of May, 1543, three months and three days after he had entered the ſeventy-firſt year of his age. He was probably buried at the foot of the altar before which he uſed to celebrate maſs; for, 38 years after his death, Cromerus, biſhop of Ermeland, cauſed the following inſcription to be placed on his tomb-ſtone, which is now ſhewn in the chapter's room:

D. O. M.
R. D. Nicolai Copernico Torunenſi,
Artium et Medicinæ Doctori, Canonico Varmienſi,
Præſtanti Aſtrologo et ejus Diſciplinæ inſtauratori,
Martinus Cromerus Epiſcopus Varmienſis,
Honoris et ad Poſteritatem Memoriæ Cauſa poſuit,
MDLXXXI.

Others pretend that Copernicus, having requeſted to be interred near his relations, was buried at Thorn, in the church of St. John, where he is repreſented in his canonical dreſs, kneeling before a crucifix, and a globe on his ſide, with this inſcription:

"Non parem Pauli gratiam requiro,
Veniam Patri neque poſco, ſed quam
In crucis ligno dederas Latroni, ſedulus oro."

Nicolai Copernico Thorunienſi abſolutæ ſubtilitatis mathematico, ne tanti viri, apud exteros celeber, in ſua patria periret memoria hoc monumentum poſitum. Mort. Varmiæ in ſuo Canonicatu, anno 1543, die 4, ætatis LXXIII.

This painting was renovated, in the year 1733, by a poſtmaſter of Thorn, named Rubinkowſki. A print of it may be ſeen in Hartknock's Ancient and Modern Pruſſia.

It is ſuppoſed that Copernicus's manuſcripts were depoſited at Braunſberg, in the Jeſuits' library, with the books of which they may have been removed to Sweden by Charles XI. Whether they be ſtill extant in that country is uncertain. Ludwig von Baczko's Kleine Schriften, 1797, vol. ii. p. 135. Gaſſendi Opera, vol. v. p. 499. Bernoulli's Travels, vol. iii. p. 18.

See the order and diſpoſition of the heavenly bodies, as laid down by him, compared with thoſe in the other ſyſtems, under the head System.

This ſyſtem has been eſtabliſhed by new arguments advanced by Kepler, Galileo, and Newton, in every ſucceeding age; and notwithſtanding the oppoſition it met with, from the prejudices of ſenſe againſt the earth's motion, the authority of Ariſtotle in the ſchools, the threats of ignorant bigots, and the terror of the inquiſition, it has generally prevailed. Galileo, after having demonſtrated the motion of the earth, was obliged, by the rancour of the Jeſuits, to go to Rome, and there ſolemnly renounce it. Beſides which cruel treatment, he was condemned to a year's impriſonment in the inquiſition, and the penance of repeating daily ſome penitential pſalms. As a ſpecimen of the authority of the Romiſh church in oppoſition to this ſyſtem, we ſhall only tranſcribe the declaration of the excellent commentators, Le Seur and Jacquier, on the Principia, prefixed to the third volume. "Newtonus in hoc tertio libro telluris motæ hypotheſim aſſumit. Autoris propoſitiones aliter explicari non poterant, niſi eâdem quoque facta hypotheſi. Hinc alienam coacti ſumus gerere perſonam. Cæterum latis a ſummis pontificibus contra telluris motum decretis nos obſequi profitemur."

Copernicus is the name of an aſtronomical inſtrument, contrived by Mr. Whiſton, for the calculation and exhibition of eclipſes, and of the motions of the planets, both the primary and ſecondary ones, &c.

It was ſo called by the inventor, as being conſtructed on the Copernican ſyſtem; or as repreſenting the heavenly bodies agreeable to it.. It conſiſts of ſeveral concentrical circles of wood; upon which are inſcribed numbers, transferred hither from the aſtronomical tables: by the various diſpoſitions of theſe circles, which are made ſo as to ſlide within each other, queſtions are ſolved; and thus long calculations are ſaved, and the work of many hours brought into a few minutes.

For the exhibition of eclipſes there is a peculiar apparatus, conſiſting of a terreſtrial globe, ſo diſpoſed, as that, being turned round its axis, the light of the ſun, or a candle, is projected through a glaſs plane, marked out into concentric circles, expreſſing digits of the eclipſe: and thus is the path of the eclipſe, with its degree or quantity in any part of its path, agreeably and accurately repreſented.

The inſtrument not being very common, a particular deſcription would be ſuperfluous. The author of it has written a book to explain it.

COPHANTA, in *Ancient Geography*, a port of Carmania.

COPHANTUS, a mountain of Aſia, placed by Pliny in Bactriana.

COPHENES, a river of India, which ran between Alexandria, and the firſt ſcene of the military operations of Alexander, and which, as major Rennell conjectures, occurred pretty early in his march. In Alexander's arrangement of boundaries, the river Cophenes was the eaſtern limit of the province of Paropamiſus, of which Alexandria was regarded as the capital; and that province, according to the ideas of Ptolemy, lay between thoſe which the moderns name Koraſan and Cabul. The major therefore concludes, with ſome degree of confidence, that the river "Cow" of the Turkiſh geography, and the "Cow-mull" of Baber, which paſſes by Nughz, and whoſe principal branches are the rivers of Ghizni and Gurdaiz, is the Cophenes; and that we muſt look for Alexandria in the quarter of Bamian, though it is not poſſible to aſſign its particular ſituation. At all events, the proximity of Alexandria to the northern mountains, a fact which Arrian impreſſes very ſtrongly, renders it an impoſſible caſe, that Alexandria and Candahar can be one and the ſame place. Leaving Alexandria, at the foot of Caucaſus, Alexander came to the river Cophenes, and paſſed it in the higher part of its courſe. From Cophenes, Hepheſtion and Perdiccas, with a ſtrong a ſtrong detachment, were ſent into the country of Peucelaotis (Arrian) or Peucolaitis (Strabo) near the Indus. Alexander marched from the banks of the Cophenes againſt the Aſpii, Thyræi, and Araſaci, nations, whoſe ſituations and modern names are unknown, but ſuppoſed by Rennell to be inferior diviſions of the modern Cabul, and ſituated between the rivers of Ghizni and Cabul, at the height of Irjab and Dukkah. In his march to Arigæus, Alexander croſſed two rivers, the "Choe" and "Euaſpla," and defeating the Aſpians in a pitched battle, near the latter, paſſed through the territories of the Guræi, and croſſed the river of the ſame name (ſee GUREUS.) The Choe and Euaſpla may be two of the nine rivers of the Lumghanat. It is very difficult to determine the length of Alexander's march from the Cophenes to the Gureus; but it might poſſibly be 100 road miles. As Alexander had croſſed the Indus, probably at Attock, when he came to the bridge (which was completed before his arrival), he made an excurſion by land into the country adjacent to the weſtern bank of the Indus, in order to view the city of Nyſa (ſuppoſed by M. d'Anville to be Nughz, or Nagaz, the Nagara, or Dionyſiopolis of Ptolemy); and he is then ſaid to have entered the country, that lay between the two rivers, Cophenes and Indus. Admitting that the Cophenes is the river that runs by Nughz, and falls into the Indus, 30 or 35 miles below the city of Attock, and as the river Cabul joins the Indus in front of the city of Attock, it is clear that, till he came oppoſite to that city, he could not be between the Cophenes and Indus. And if it be ſaid, that the Cabul river was the Cophenes, he had all along been between the Cophenes and Indus; and Arrian's words could have no meaning. Upon the whole we may conclude that the ancient Cophenes was the ſame with the modern *Cow*, which ſee. Rennell's Memoir, p. 170, &c.

COPHOS, a place of Greece, in Attica, ſituated before Piræa.

COPHOSIS, in *Medical Writers*, is uſed for deafneſs, whether beginning, or perfect, or from what cauſe ſoever.

The word is derived from κοφεω, *I am deaf.*

COPHRANTA, or COPHANTA, an ancient town of Aſia, in Carmania. Ptolemy.

COPHSIS, SAMUEL, in *Biography*, a learned Jewiſh Rabbi of Spain in the eleventh century, was a native of Cordova, and publiſhed a commentary on the Pentateuch, the manuſcript of which is ſtill extant in the Vatican library. Thoſe who have examined it commend it as an excellent work, except that it too much abounds with allegories. The author died A.D. 1034.

COPHTI, COPHTS, or COPTS, a name given to the Chriſtians of Egypt; who are of the ſect of Jacobites.

They derive the latter appellation from the learned Jacobus Zanzalu, biſhop of Edeſſa, who, when the Coptic party had ſunk in number and credit, appeared in defence of the Monophyſite doctrine; and by his writings, as well as indefatigable travels through moſt parts of the Eaſt, ſucceeded to ſuch a degree in reviving and diſſeminating it, that he hath been reverenced and eſteemed by the whole ſect, which, from reſpect to him have aſſumed the name of Jacobites: though the other Chriſtians, as well as the Turks, call them by their old name Copts. By way of contempt ſome have called them "Kufti" or Girdlers, thus intimating that they are Chriſtians only from the girdle upwards, but bear the ſcar of Judaiſm below it.

The critics are extremely divided about the origin and orthography of the word: ſome write it *Gophti*, others *Cophtites*, *Cophtitæ*, *Copts*, &c. Scaliger derives the name from *Coptos*, an anciently celebrated town of Egypt, the metropolis of the Thebaid, whither they retired from the tyranny of the Greeks. Kircher refutes this opinion, and maintains, that the word originally ſignifies *cut* and *circumſcribed;* and was given theſe people by the Mahometans, by way of reproach, becauſe of their practice of circumciſing: but P. Sollier, another Jeſuit, refutes this opinion. Scaliger afterwards changed his opinion, and derived the word from Αιγυπτος, the ancient name of Egypt, by retrenching the firſt ſyllable; but this opinion, too, P. Sollier diſputes. Volney, concurring in opinion with Scaliger, obſerves, that the Arabic term *Kobti*, a Copt, ſeems to be an evident abbreviation of the Greek word *Ai-goupti-os*, an Egyptian; for the γ was pronounced *ou* among the ancient Greeks; and the Arabs, having neither *p* nor *g* before *a*, *o*, *u*, always ſubſtitute for thoſe letters *b* and *b*. John de Leo and others ſay, that the Egyptians anciently called their country *Elchibth*, or *Cibth*, from Cibth their firſt king, whence *Cophtite*, &c. others ſay from Cobtim ſecond king of Egypt. Vanſleb derives the word *Copht* from Copt, ſon of Miſraim, grandſon of Noah. All theſe etymologies P. Sollier rejects, on this principle, that were they true, the Egyptians ought all equally to be called *Cophti;* whereas, in effect, none but the Chriſtians, and among thoſe none but the Jacobites, bear the name; the Melchites not being comprehended under it. Hence he chooſes to derive the word from the name *Jacobite*, by retrenching the firſt ſyllable; whence *Cobite*, *Cobea*, *Copta*, and *Cophta*.

Several families of theſe Copts are to be found in the Delta; but the greateſt number inhabit the Said, where they in ſome places occupy whole villages. Both hiſtory and tradition atteſt their deſcent from the people who were conquered by the Arabs, that is, from that mixture of Egyptians, Perſians, and, above all, Greeks, who, under the Ptolemies and the Conſtantines were ſo long in poſſeſſion of Egypt. Their name, according to the etymology given of it by Scaliger and by Volney, ſeems to indicate that they are the remains of the ancient Egyptians; and this is the more probable, ſince we find them in the Said before the time of Diocleſian; and it is certain the Greeks were leſs numerous in the Said than in the Delta. This opinion of their origin is rendered ſtill more probable, by conſidering the diſtinguiſhing features of this race of people; and they are found to be all characteriſed by a ſort of yellowiſh duſky complexion, which is neither Grecian nor Arabian; they have all a puffed viſage, ſwoln eyes, flat noſes, and thick lips, or, in ſhort, the exact countenance of a Mulatto. Volney, when he ſaw the figure of the ſphynx, and obſerved its features to be preciſely thoſe of a negro, recollected the remarkable paſſage of Herodotus, in which he ſays, (lib. ii.) "For my part, I believe the Colchi to be a colony of Egyptians, becauſe, like them, they have black ſkins and frizzled hair." Hence he concludes, that the ancient Egyptians were real negroes, of the ſame ſpecies with all the natives of Africa; and though, as we might naturally expect, after mixing for ſo many ages with the Greeks and Romans, they have loſt the intenſity of their firſt colour, yet they ſtill retain ſtrong marks of their original conformation. "How are we aſtoniſhed," ſays Volney, "when we behold the preſent barbariſm and ignorance of the Copts, deſcended from the profound genius of the Egyptians, and the brilliant imagination of the Greeks; when we reflect that to the race of negroes, at preſent our ſlaves, and the objects of our extreme contempt, we owe our arts, ſciences, and even the very uſe of ſpeech; and when we recollect that, in the midſt of thoſe nations who call themſelves the friends of liberty and humanity, the moſt barbarous of ſlaveries is juſtified; and that it is even a problem, whether the underſtanding of negroes be of the ſame ſpecies with that of white men!" The language formerly ſpoken by the Copts furniſhes another argument in favour of the origin above aſcribed to them. On the one hand the form of their letters, and the greater part of their words, demonſtrate that the Greek nation, during the thouſand years it continued in Egypt, has left deep marks of its influence; but, on the other, the Cophtic alphabet has five letters, and the language a number of words, which are to be conſidered as the remains of the ancient Egyptian. Theſe, when critically examined, have a ſenſible analogy with the dialects of the ancient neighbouring nations, ſuch as the Arabs, Ethiopians, Syrians, and even thoſe who lived on the banks of the Euphrates; nor can it be doubted that all theſe languages are derived from one common ſtock. For upwards of three centuries, that of the Copts has fallen into diſuſe. The Arabs, diſdaining the language of the nations they ſubdued, impoſed on them, together with their yoke, the neceſſity of learning that of their conquerors. This obligation became even a law, when, about the end of the firſt century of the Hegira, the Caliph Waled I. prohibited the Greek tongue throughout his whole empire. From that time the Arabic became univerſal; and the other languages, confined to books, ſubſiſted only for the learned, who neglected them. Such has been the fate of the Cophtic. The prieſts and monks no longer underſtand it, in their ſcriptures and books of devotion in which alone it exiſts.

Mr. Browne, a late traveller in Africa, (p. 71.) does not admit this hypotheſis of Volney; for he obſerves, that the Copts, or original inhabitants of Egypt, have no reſemblance of the negro features or form; though they have ſome peculiarities of feature common to them all. Their hair and eyes are of a dark hue, and the former is often curled; but not in a greater degree than is occaſionally ſeen among Europeans. The noſe is often aquiline; and though the lips be ſometimes thick, they are by no means generally ſo; and on the whole, a ſtrong reſemblance may be traced between the form of viſage in the modern Copts, and that preſented in the ancient monuments, paintings, and ſtatues. Their complexion, like that of the Arabs, is of a duſky brown; it is repreſented of the ſame colour in the paintings, ſeen by Mr. Browne in the tombs of Thebes. The Coptic women have intereſting features, large black eyes, and a genteel form.

The Copts differ from the Arabs by their religion, which is Chriſtianity, and which they embraced at an early period; but they are again diſtinct from other Chriſtians by their opinions, which are thoſe of the Eutychians or Monophyſites. Their adherence to theſe opinions has expoſed them to the perſecution of the other Greeks, and thus they are rendered irreconcileable enemies. When the Arabs conquered the country, they took advantage of theſe animoſities, to enfeeble them both. The Copts, however, have at length expelled their rivals; and as they have been always intimately acquainted with the interior of the country, they are become the depoſitaries of the regiſters of the lands and tribes. Under the name of "Writers," they are at Cairo the intendants, ſecretaries, and collectors of government. Theſe writers, deſpiſed by the Turks whom they ſerve, and hated by the peaſants whom they oppreſs, form a kind of ſeparate claſs, the head of which is the writer to the principal Bey. He diſpoſes of all employments in that department, which, according to the ſpirit of the Turkiſh government, he beſtows on the beſt bidder.

The Copts endured many ſeverities, and were reduced to extreme poverty and diſtreſs by the intolerance and perſecution of the Greeks; but when Amrou invaded Egypt, A. D. 638, the Copts availed themſelves of the opportunity which was afforded by their voluntary ſubmiſſion to the conqueror for retaliation on their perſecutors. The Saracens were received by them as the deliverers of the Jacobite church; and during the ſiege of Memphis a ſecret and effectual treaty was opened between a victorious army and a people reduced to the moſt abject diſtreſs and bondage. "The Greeks," ſaid Mokawkas, a rich and noble Egyptian, connected with the Coptic ſect, in his firſt conference with Amrou, "are determined to abide the determination of the ſword; but with the Greeks I deſire no communion, either in this world or in the next; and I abjure for ever the Byzantine tyrant, his ſynod of Chalcedon, and his Melchite ſlaves. For myſelf and my brethren, we are reſolved to live and die in the profeſſion of the goſpel and unity of Chriſtians. It is impoſſible for us to embrace the revelations of your prophet; but we are deſirous of peace, and cheerfully ſubmit to pay tribute and obedience to his temporal ſucceſſors."

The tribute was aſcertained at two pieces of gold for the head of every Chriſtian; but old men, monks, women, and children, of both ſexes, under 16 years of age, were exempted from this perſonal aſſeſſment; the Copts above and below Memphis ſwore allegiance to the caliph, and promiſed an hoſpitable entertainment of three days to every muſſulman who ſhould travel through their country. By this charter of ſecurity, the Copts obtained a triumph over their enemies, and the ſacred edifices, with the patrimony of the church, were reſtored to the national communion of the Jacobites, who enjoyed without moderation the moment of triumph and revenge. From the ſuperiority thus acquired, and the conduct by which it was obtained, and by which it was ſucceeded, proceeded that permanent and invincible animoſity, which hath ſubſiſted between the Copts and the Greeks ever ſince their ſubjection to the Turks; and which the Romiſh miſſionaries have endeavoured to terminate, by uſing every method likely to reconcile both theſe ſects to the church of Rome. In the 17th century attempts were made for uniting the Monophyſites of Aſia with the Romiſh church, and they were attended with a partial and temporary ſucceſs; but the African Monophyſites, and more eſpecially the Copts, notwithſtanding that poverty and ignorance which expoſed them to the ſeductions of ſophiſtry and gain, maintained their principles with firmneſs, and made an obſtinate reſiſtance to the promiſes, preſents, and attempts, employed by the papal miſſionaries to bring them under the Roman yoke. The Copts, ever ſince the Saracen conqueſt above-mentioned, have had churches, prieſts, biſhops, and a patriarch, who fixed his ſeat of reſidence at Cairo, when that city became the capital. In their worſhip they blend a number of ſuperſtitious cuſtoms, which have been tranſmitted to them from their anceſtors and which they obſtinately retain. In other reſpects, ſays Savary (Letters on Egypt, vol. ii.) the Copts are gentle, humane, and hoſpitable. Paternal tenderneſs and filial love conſtitute the happineſs of their families. They honour and cheriſh all the ties of blood. The internal commerce, the art of hatching chickens, and that of bringing up bees, form almoſt their only ſcience. They often acquire conſiderable wealth in the management of the affairs with which they are entruſted, but they are never allowed to enjoy the fruit of their labours in tranquillity. The Bey, who ſees their opulence, ſtrips them without pity;—happy if they can ſecure their lives by the ſacrifice of their fortune. Theſe vexations, however, never excite them to revolt.

Their want of energy keeps them chained down to ſervitude and miſery, which they endure without murmuring. Mr. Browne repreſents the Copts as an acute and ingenious people, who get money ſteadily without oſtentation, conſidering, that, under an arbitrary government, obſcurity is ſafety. In their temperament, he ſays, they are melancholic, but, if called into action, induſtrious and laborious. However, they are fond of their diſtilled liquors, and rather licentious in their amours. They are zealous in their faith, this writer adds, and their eccleſiaſtics are numerous. The populous city of Cairo, as we have ſaid, affords a reſidence, or rather a ſhelter, for their indigent patriarch, and a remnant of 10 (ſome ſay 12 or 13) biſhops; 40 monaſteries have ſurvived the depredations of the Arabs; and the progreſs of ſervitude and apoſtacy has reduced the Coptic nation to the deſpicable number of twenty-five or thirty thouſand families; a race of illiterate beggars, whoſe only conſolation is derived from the ſuperior wretchedneſs of the Greek patriarch and his diminutive congregation.

The Coptic patriarch, though he reſides at Cairo, takes his title from Alexandria; and the body of the inferior clergy, whether ſecular or regular, is compoſed of the orders of St. Antony, St. Paul, and St. Macarius, who have each their monaſteries.

Beſides the orders of prieſts, deacons, and ſubdeacons, the Copts have likewiſe archimandrites, the dignity whereof they confer with all the prayers and ceremonies of a ſtrict ordination. This makes a conſiderable difference among the prieſts; and beſides the rank and authority it gives them with regard to the religious, it comprehends the degree and functions of archprieſts. By a cuſtom of about ſeven hundred years, if a prieſt elected biſhop be not already archimandrite, that dignity muſt be conferred on him before epiſcopal ordination.

The ſecond perſon among the clergy, after the patriarch, is the titular-patriarch of Jeruſalem, who alſo reſides at Cairo, becauſe of the few Copts at Jeruſalem; he is, in effect, little more than the biſhop of Cairo: only he goes to Jeruſalem every Eaſter, and viſits ſome other places in Paleſtine near Egypt, which own his juriſdiction.

To him belongs the government of the Coptic church, during the vacancy of the patriarchal ſee.

To be elected patriarch, it is neceſſary the perſon have lived all his life in continence: it is he confers the biſhoprics. To be elected biſhop, the perſon muſt be in the celibate; or, if he have been married, it muſt not be above once.

The prieſts and inferior miniſters are allowed to be married before ordination; but are not obliged to it, as Ludolphus erroneouſly obſerves. They have a great number of deacons, and even confer the dignity frequently on children. None but the loweſt rank among the people commence eccleſiaſtics; whence ariſes that exceſſive ignorance found among them: yet the reſpect of the laity towards the clergy is very extraordinary. Their office is longer than the Roman office, and never changes in any thing: they have three liturgies, which they vary occaſionally.

The monaſtic life is in great eſteem among the Copts; to be admitted into it, there is always required the conſent of the biſhop. The religious Copts make a vow of perpetual chaſtity; renounce the world, and live with great auſterity in deſerts: they are obliged to ſleep in their cloaths and their girdle, on a mat ſtretched on the ground; and to proſtrate themſelves every evening a hundred and fifty times, with their face and breaſt on the ground. They are all, both men and women, of the loweſt claſs of the people; and live on alms. The nunneries are properly hoſpitals; and few enter but widows reduced to beggary.

The preſent habitation of the Coptic cœnobites is ſituated in the deſert of Nitria, called alſo after the name of a famous ſaint denominated Macarius, and is diſtinguiſhed by the appellation of "Zaïdi el Baramous," and called by the Arabs, "Kaſr Zaïdi." It is an encloſure of high walls without any gate, unleſs that name ſhould be given to a ſmall wicket, which is opened only twice or thrice in the courſe of a year. Perſons entering or leaving it are hoiſted up and lowered down by means of a ſtrong rope and a pulley. The building is entirely conſtructed of ſoft calcareous ſtones, ſeveral of which contain foſſile ſhells. Within the walls there is a kind of ſmall fort, ſurrounded by ditches, over which is built a drawbridge. Here the monks retire, when the Arabs ſucceed in forcing the outer walls. In this little fort are a church, a ciſtern, and proviſions; in ſhort, every thing for enabling the monks to ſuſtain a long ſiege. Here they alſo keep their books, written in the Coptic language; which they cannot on any conſideration be prevailed on to part with, although they never read them, and ſuffer them to lie on the ground, eaten by vermin and covered with duſt. The cells of the monks are vaulted and very low, and are indeed no better than a ſort of dens, not unſuitable to the ignorant and ſlothful wretches who inhabit them. The church is ſimple in its conſtruction, and has no other ornament beſides a few oſtrich's eggs, and bad pictures of ſaints. It is impoſſible, ſays Sonnini, (Travels in Upper and Lower Egypt, p. 354.) to give an idea of the confuſion that ſometimes prevails in their church: they often know not what they are to ſing; one will have a particular anthem or pſalm, and another a different one: they then diſpute and come to blows; in the mean time a third chaunts a prayer, which is followed by the choir, and thus the quarrel terminates. Their ſinging conſiſts of Turkiſh and Arabic airs, accompanied by cymbals, the noiſe of which, mixed with their ſqualling voices, and their diſcordant muſic, makes the church re-echo with a medley of jarring ſounds. The prieſt celebrates maſs with water. They conſecrate common bread; which the prieſt cuts in pieces and mixes with water, which is likewiſe conſecrated. This makes a kind of ſoup, of which he eats a few ſpoonfuls; and afterwards adminiſters the ſacrament, alſo with a ſpoon, to all that are preſent. After the communion the prieſt waſhes his hands, and ſtanding at the door of the chancel, extends them to ſtroke the face of every one who paſſes. During maſs, the prieſt alſo bleſſes little loaves which are diſtributed at the cloſe of the ſervice. The prieſt who celebrates maſs is dreſſed in a kind of white ſhirt, made with a cowl, and covered with little croſſes. During the other prayers, he only wears a large fillet of white linen, with ſimilar little croſſes, half twiſted round his head in the form of a turban, with the two ends hanging down before and behind. In this convent there were only three prieſts and ſome friars, with a ſucceſſion of perſons who come hither from time to time to do penance, and who bring the monks the means of ſubſiſtence. Their fare conſiſts of bread, or rather biſcuit, made of flour of lentils, and rice boiled in ſalt and water, bad cheeſe, and a little honey; and their only beverage is a brackiſh and ill-taſted water. Their ſupplies are conveyed to them from the alms of the rich Copts at Cairo. In theſe monaſteries, ſeveral of which are found in this deſolate country, the Coptic travellers through the deſert are ſure of finding neceſſaries for themſelves and their horſes; which they obtain by ringing a ſmall bell, the cord of which hangs down on the outſide.

F. Roderic reduces the errors and opinions of the Copts to the following heads: 1. That they put away their wives, and eſpouſe others while the firſt are living. 2. That they have ſeven ſacraments; *viz.* baptiſm, the euchariſt, confirmation, ordination, faith, faſting, and prayer. 3. That they deny the Holy Spirit to proceed from the Son. 4. That they only allow of three œcumenical councils; that of Nice, Conſtantinople, and Epheſus. 5. That they only allow of one nature, will, and operation, in Jeſus Chriſt, after the union of the humanity with the divinity: in other words, they are Monophyſites, Monothelites, or Eutychians. Mr. Browne (*ubi ſupra*) ſays, that they embrace tranſubſtantiation; in which, and other points, the Catholics of Cairo think they approach their faith nearer than the Greeks. As to their errors in diſcipline, they may be reduced, 1. To the practice of circumciſing their children of both ſexes before baptiſm, which has obtained among them from the twelfth century. 2. To their ordaining deacons at five years of age. 3. To their allowing of marriage in the ſecond degree. 4. To their forbearing to eat blood: to which ſome add their belief of a baptiſm by fire, which they confer by applying a hot iron to their forehead or cheeks.

Others palliate theſe errors, and ſhew that many of them are rather abuſes of particular perſons, than doctrines of the ſect. This ſeems to be the caſe with regard to their polygamy, eating of blood, marrying in the ſecond degree, and the baptiſm of fire: as for circumciſion, it is ſaid not to be practiſed as a ceremony of religion, nor as of any divine appointment, but merely as a cuſtom which they derive from the Iſhmaelites; and which, perhaps, may have had its origin from a view to health and decency in thoſe hot countries.

The Copts have adopted, from the Mahometans, the cuſtom of frequent proſtrations during divine ſervice; of ablution after the conjugal rites, &c. In many reſpects their faith, diſcipline, and worſhip, reſemble thoſe of the Abyſſinians; ſee that article.

The Copts, at different times, have made ſeveral re-unions with the Latins; but always in appearance only, and under ſome neceſſity of their affairs. In the time of pope Paul IV., a Syrian was diſpatched to Rome from the patriarch of Alexandria, with letters to that pope; wherein he acknowledged his authority, and promiſed obedience; deſiring a perſon to be diſpatched to Alexandria, to treat about a re-union of his church to that of Rome: purſuant to which, Pius IV., ſucceſſor to Paul, choſe F. Roderic, a Jeſuit, whom he diſpatched in 1561, in quality of apoſtolical nuntio.

But the Jeſuit, upon a conference with two Copts deputed for that purpoſe by the patriarch, was made to know, that the titles of *father of fathers*, *paſtor of paſtors*, and *maſter of all churches*, which the patriarch had beſtowed on the pope in his letters, were no more than mere matters of civility and compliment; and that it was in this manner the patriarch uſed to write to his friends: they added, that ſince the council of Chalcedon, and the eſtabliſhment of ſeveral patriarchs independent of one another, each was chief and maſter of his own church. This was the anſwer the patriarch gave the pope, after he had received a ſum of money remitted to him from Rome, by the hands of the Venetian conſul.

COPHTIC, or Coptic, the language of the Copts, the ancient language of the Egyptians, mixed with a great deal of Greek; its alphabet being manifeſtly nothing elſe but Greek, with the addition of ſome few letters, to expreſs ſounds, which the Grecians had not, and which probably came to be uſed in Egypt after the time of Alexander; though we know that the Greek language, and perhaps alſo the Greek letters, were taught there long before, in the reign of Pſammetichus. Of this affinity the reader may judge, by the following table of the Cophtic alphabet:

Figure.	Name.	Power.	Figure.	Name.	Power.
Ⲁⲁ	Alpha	A.	Ⲡⲡ	Pi	P.
Ⲃⲃ	Bita	B. V.	Ⲣⲣ	Ro	R.
Ⲅⲅ	Gamma	G.	Ⲥⲥ	Sima	S.
Ⲇⲇ	Dalda	D.	Ⲧⲧ	Tau	T.
Ⲉⲉ	Ei	E.	Ⲩⲩ	Ypſilon	Y. U.
Ⲋⲋ	So	S.	Ⲫⲫ	Phi	Ph.
Ⲍⲍ	Zita	Z.	Ⲭⲭ	Chi	Ch. Græc
Ⲏⲏ	Hita	I. Æ.	Ⲱⲱ	O	O long.
Ⲑⲑ	Thita	Th.	Ϣϣ	Shei	Sh.
Ⲓⲓ	Iauda	I.	Ϥϥ	Fei	F.
Ⲕⲕ	Kappa	K.	Ϧϧ	Khei	Kh.
Ⲗⲗ	Lauda	L.	Ϩϩ	Hori	H.
Ⲙⲙ	Mi	M.	Ϫϫ	Janja	J.
Ⲛⲛ	Ni	N.	Ϭϭ	Shima	Sh.
Ⲝⲝ	Xi	X.	Ϯϯ	Dhei	Dh.
Ⲟⲟ	O	O ſhort.	Ⲯⲯ	Epſi	Pſ.

The old Cophtic, which Kircher maintains to be a mother-tongue, and independent of all others, had been much altered by the Greek; for beſides that it has borrowed all its characters from the Greek, with a very little variation, a great number of the words are pure Greek.

Voſſius, indeed, aſſerts, that there was no Cophtic language till after Egypt became ſubject to the Arabs. The language, according to him, is a mixture of Greek and Arabic: the very name thereof not being in the world till after the Arabs were maſters of the country. But this, M. Simon obſerves, proves nothing; except that what was anciently called Egyptian, has ſince by the Arabs been called Cophtic, by a corruption of ſpeech. There are, it is true, Arabic words in the Cophtic; yet this by no means proves but that there was a language before that time, either Cophtic or Egyptian. Pietro de la Valle obſerves, that the Copts have entirely loſt their ancient tongue; that it is now no longer underſtood among them; that they have nothing extant therein but ſome ſacred books; and that they ſtill ſay maſs in it.

All their other books have been tranſlated into Arabic, which is their vulgar tongue; and this has occaſioned the originals to be loſt: it is added, that they rehearſe the Epiſtles and Goſpels in the maſs, twice; once in Arabic, and once in Cophtic.

Indeed, if we believe F. Vanſleb, the Copts ſay the maſs in Arabic, all but the Epiſtles and Goſpels, which they rehearſe both in that and Cophtic.

It ſufficiently appears, that, after the conqueſt by the Saracens, the ancient language ſo far continued to be that of religion, that it was uſed in the divine ſervice; and in the country of the Copts, the goſpel, according to Niebuhr, is even now read in Cophtic: but he obſerves, that this tongue is not underſtood even by the prieſts, and that the ſervice is afterwards read in the Arabic, which is the preſent language of Egypt. Mr. Browne ſays, that in the Cophtic monaſteries, the prayers are read in Arabic, and the epiſtle and goſpel in Cophtic; but the prieſt is a mere parrot, repeating a dead letter.

The Cophtic tongue, at preſent, conſiſts chiefly of the old Egyptian and Greek, ſtill bearing evident marks of primitive antiquity in its ſtructure and conſtitution, with regard to which it differs ſo much from all the Oriental and European languages, that it is impoſſible to conceive it derived from any of them. For the Copts neither decline their nouns, nor conjugate their verbs, (not even thoſe of foreign extract,) otherwiſe than by prefixing particles ſometimes of one or more ſyllables, and ſometimes of a ſingle letter, which denote the caſe, gender, number, and perſon; ſeveral of them being often joined together in one word, and the primitive word uſually placed laſt. Hence the difficulty of this tongue conſiſts in the incredible combination of the words and particles, in the change of the vowels, and in tranſpoſing the middle part of the word, and in adding ſuperfluous letters; ſo that it requires great labour and ſkill to diſtinguiſh them.

From numerous and minute reſearches, Mr. Browne is led to affirm, that the Cophtic language may be conſidered as extinct: although in Upper Egypt, they unknowingly retain ſome Cophtic words.

F. Kircher is the firſt who publiſhed a grammar and vocabulary of the Cophtic. There is not known any book extant in the Cophtic, except tranſlations of the Holy Scriptures or of eccleſiaſtical offices; or others that have relation to theſe, as dictionaries, &c.

Dr. Woide, who began his Coptic ſtudies at Leyden, and was aſſiſted in them by Saholtz, the editor of La Croze's Coptic lexicon, returned his obligations by the ſervices which he rendered to him in that publication. He ſuperintended the impreſſion of the abridgement of it, which was publiſhed at Oxford, and there applied himſelf to the ſtudy of the Sahidic dialect, or that of the Upper Egypt. In 1778, he publiſhed the celebrated Coptic and Sahidic grammar of Saholtz, under the following title: "Chris. Saholtz *Grammatica Egypti utriuſque Dialecti, quam breviavit, illuſtravit, edidit* C. G. Woide." An excellent Coptic grammar was alſo publiſhed at Parma, in 1783, under the title, "*Didymi Taurinenſis Literaturæ Copticæ Rudimentum.*"

Cophtic, or Coptic *Bible.* See *Coptic* Bibles.

Cophtic *Liturgies* are three; one attributed to Baſil; another to St. Gregory, and the third to Cyril: they are tranſlated into Arabic for the uſe of the prieſts and people.

COPHTOS, in *Geography.* See Coptos.

COPIA Claudia Augusta Colonia, a name given to the modern Lyons.

Copia *Cornu.* See Cornucopia.

Copia *libelli deliberanda*, in *Law*, a writ that lay where a man could not get the copy of a libel at the hand of a judge eccleſiaſtical, to have the ſame delivered to him. Reg. Orig. 51.

COPIÆ, in *Ancient Geography*, a town of Italy, in the gulf of Tarentum; called alſo *Sybaris.*

Copiæ *Militares*, *military forces*, a military body inſtituted particularly by Auguſtus, for the defence of the Roman empire. It was divided into three claſſes or deſcriptions. The firſt, called *copiæ claſſicæ*, was deſtined to defend the ſeas and rivers againſt the incurſions of pirates, and to protect navigation; the ſecond, called *copiæ provinciales*, defended the frontiers, and encamped or ſojourned in the frontier towns, as neceſſity or occaſion required; and the third, called *copiæ urbanæ*, remained at Rome, as a guard for the capital, and alſo for the emperor, in caſe of need.

Copiæ *Provinciales.* See Copiæ *Militares.*

Copiæ *Urbanæ.* See Copiæ *Militares.*

COPIAPO, in *Geography*, one of the thirteen provinces into which the kingdom of Chili in South America is divided. It is ſituated in the moſt northern part of the kingdom, and is one of the richeſt metallic countries in the world. In this province are two mountains entirely compoſed of cryſtallized ſulphur, ſo pure that there is no occaſion for refining it. It has alſo mines of gold, ſilver, iron, copper, and lead. The whole ſoil is impregnated with ſal-gem; and ſalt-petre is common. It furniſhes alſo turquoiſes, that is, teeth or bone coloured green by metallic vapours. In this province and that of Coquimbo little rain falls; and earthquakes are ſeldom known in either of them. It has two ports; one of the ſame name, and another which lies 30 leagues further to the ſouth, and conſiſts only of a few huts.

Copiapo, a town of Chili, in the fore-mentioned province, to which it gives name; ſituated about 12 leagues from the ſea-coaſt, very irregularly built, but containing between three and four hundred families. S. lat. 26° 50′. W. long. 70° 18′.

Copiapo, a river of S. America, in Chili, which runs into the Pacific Ocean, a little to the north of the town of Copiapo.

COPIATA, under the *Weſtern Empire*, a *grave-digger.* In the firſt ages of the church, there were clerks deſtined for this employment. In the year 357, Conſtantine made a law in favour of the prieſts *copiatæ*, *i. e.* of thoſe who had the care of interments; whereby he exempts them from the luſtral contribution which all other traders paid.

It was under him alſo that they firſt began to be called *copiatæ*, *q. d.* clerks deſtined for bodily labour, from κοπος, of κοπω, *ſcindo*, *cædo*, *ferio*, *I cut*, *beat*, &c. Before that time they were called *decani* and *lecticarii*; perhaps, becauſe they were divided by decads or tens, each whereof had a bier or litter for the carriage of the dead bodies. Their place among the clerks was the next in order before the chantors.

COPING over, in *Carpentry*, a ſort of hanging over, not ſquare to its upright, but bevelling on its under ſide till it end in an edge.

Coping, among *Builders*, ſignifies the top or covering of a wall. The beſt copings are of hewn ſtone, where it can readily be procured: in other ſituations, where large paving-bricks are made of a good and durable quality, theſe may with propriety be uſed flat for coping. Bricks of particular ſhapes are often made for coping, either to be uſed ſingly, or firſt a courſe of two bricks in width, to form a projection for ſhooting the wet off the faces of the wall, and then a half cylindrical brick for completing the coping. Several years ago, Mr. Peter Wych communicated to the Society of Arts in London (Doſſie's Memoirs, vol. ii. p. 16.) a method of making a durable coping for garden walls, of a mixture of baked gypſum and coal-aſhes. We lately obſerved on the Grand Junction Canal, that ſeveral of their bridges have been repaired, where the coping ſtones were broken by accidents, with Parker's Roman cement; and that others of their bridges and walls were wholly coped with this compoſition, which appeared little inferior to ſtone in hardneſs, and leſs brittle than moſt kinds of coping-ſtones are. See Canal. In ſtony diſtricts, where the fields are ſeparated by rough and dry ſtone walls, the ſame are uſually coped by a row of rough and triangular ſtones, ſet edgeways on the top of the wall. The cementing of theſe together with a little good mortar is a good practice. Where the ſtone is leſs hard or durable, theſe kinds of dry walls are ſometimes coped with a circular ridge of good but very coarſe mortar, prepared for the purpoſe. The practice of properly ſecuring and attending to the coping of dry-built walls cannot be too much enforced, for want of which the rubbing of cattle and other accidents ſoon make breaches in ſuch walls, that are very expenſive to repair. In ſome counties, where ſtone is very ſcarce, and fuel for burning bricks very dear, garden and other walls are made of mud or tempered clay, with a mixture of chopped ſtraw or ſtubble to hold them together; and ſuch are ſometimes thatched with ſtraw, by way of coping: for both theſe, and the *piſé* walls, compoſed of dry earth rammed together in a mould, which have lately been introduced in England, muſt be carefully preſerved from the wet by a ſecure coping, or they ſoon moulder into their original dirt.

COPLAND, in *Geography*, the name of a cluſter of ſmall iſlands in the north Channel, nearly oppoſite to Donaghadee, in the county of Down, Ireland. One of them has a few cabins upon it; and another has a light-houſe, which is very uſeful to thoſe going to Belfaſt, or croſſing the Channel between Donaghadee and Portpatrick. That which has the light-houſe on it is in W. long. 5° 24′. N. lat. 54° 39′.

COPLE, a vicarage in Bedfordſhire, in Wixamtree hundred, is remarkable for being formerly the reſidence of ſir Samuel Luke, and of Butler, the author of Hudibras, which celebrated poem is ſuppoſed to have been written at Wood-End houſe, in this pariſh. The Ouſe navigation paſſes the northern extremity of this pariſh; and ſome years ago, a cut was made, a mile or more in length, for conveying barges up to a new houſe and premiſes, intended as a wharf, (now the Dog ale-houſe;) but for want of previous conſent on the part of the owner of this part of the Ouſe navigation, it was not permitted to be uſed. See Canal. The ſubſoil or ſtrata in this pariſh is clay throughout, with lime-ſtone at a conſiderable depth beneath the ſurface: for a conſiderable width next the Ouſe the clay is covered with gravel, and produces good turnip land.

COPOS, from κωπος, *labour*, in *Medical Writers*, is uſed for a wearineſs of the body, when the muſcles, or their fibres rather, are loaded and obſtructed with viſcous humours, ſo as to render them unfit for motion.

COPPA, Il Cavalier, called *Ant. Giarola*, in *Biography*, an hiſtorical painter, who was born at Verona about the year 1595, and became ſucceſſively the ſcholar of the celebrated Bologneſe maſters, Guido and Albano. He is conſidered one of the beſt imitators of the graceful and delicate manner of the former, although in his compoſitions he is ſometimes too crowded; and he was ranked by his ſecond maſter, Albano, amongſt his moſt favoured diſciples. He was ſome time painter to the court of Mantua, the churches of which city are enriched by many of his principal works. He died in the year 1665. Lanzi. Storia Pitt.

Coppa, in *Law*, a cop or cock of graſs, hay, or corn, divided into titheable portions; as the tenth cock, &c. This word in ſtrictneſs denotes the gathering or laying up the corn in copes or heaps, as the method is for barley or oats, &c. not bound up, that it may be the more fairly and juſtly tithed: and in Kent they ſtill retain the word, a *cop* or *cap* of hay, ſtraw, &c.

COPPARBERG, in *Geography*, one of the twenty-eight governments into which the kingdom of Sweden is divided, comprizing the province of Dalecarlia, is alſo called *Fahlun*, and *Gamla Copparberger*, old copper mines. It is a large, populous mine town, ſituated between two lakes and two mountains; 36 miles W. of Gefle, 24 N.E. of Hedemora, in N. lat. 60° 30′. The ſtreets are regular, but the houſes are all of wood, except the town's hall and two churches, the roofs of which are covered with copper. It is the fifteenth among the towns that vote in the Swediſh diet. The governor reſides at *Noor*, a royal manor near the town. The famous copper mine, which Guſtavus Adolphus uſed to call the Swediſh exchequer, lies a little to the weſt. It has been worked one thouſand years, and its copper is ſtill reckoned the beſt in Europe. From 1633 to 1761 it yielded 1,180,724 Swediſh ſhippounds. Its greateſt produce was in the year 1650, when it gave 20,321 ſhippounds. Since the year 1780, it yields nearly 6000 ſhippounds annually; but the expences increaſe in proportion, as the miners muſt go to a greater depth. In 1801, the mine was ſaid to be 1080 feet deep, and to give employment to 1200 workmen. The copper is found in large maſſes. Catteau Tableau de la Suede. Schlözer's Briefwechſel.

COPPAY, one of the ſmall weſtern iſlands of Scotland; 2 miles W. from the S.W. extremity of the iſland of Lewis.

COPPEL, Copel, or Cuppel, in *Chemiſtry*. See Cuppell.

COPPELLING. See Cuppellation.

COPPENBRUGGE, in *Geography*, a town of Germany, in the circle of Weſtphalia, and county of Spiegelberg; 19 miles S.W. of Hanover.

COPPER, *Kupper*, Germ. *Cuivre*, Fr. *Cuprum*, *Aes*. Lat. *Venus*, Alchem.

Copper is a ductile and malleable metal, of a pale yellowiſh red colour. It is ſoluble in moſt acids, and is precipitable from them in the metallic ſtate, by iron or zinc: its oxyd is ſoluble in ammonia, to which it communicates a bright blue purple colour.

§ 1. *Ores of Copper.*

Sp. 1. Native copper. *Gediegen Kupper*. *Cuivre natif.*

Its colour is a clear copper-red, often tarniſhed, externally yellowiſh, blackiſh, or whitiſh.

It occurs in maſs, diſſeminated, in leaves and grains, alſo capillary, moſs-like, dendritical and cryſtallized. The regular forms that it preſents, are the cube, the octohedron, and the pyramidal dodecahedron often with a ſhort ſix-ſided priſm interpoſed.

The cryſtals are ſmall, and generally implanted in each other, forming cluſtered maſſes. Its luſtre internally is gliſtening and metallic; its fracture is hackly: when cut or rubbed, it acquires a high metallic luſtre. It is not very hard, is malleable and flexible, but not elaſtic, is tough and difficultly frangible. Sp. gr. 7.72.—8.58.

It is fuſible before the blow-pipe, and appears to be pure copper.

It occurs in veins and beds in various primitive and ſecondary mountains, accompanied by many of the other ores of copper, alſo by galena, horn ſilver, native ſilver, calcareous, heavy, and fluor ſpars.

It is very extenſively, but not very abundantly, diffuſed; the largeſt maſſes appear to be procured from the copper mine river, within the arctic circle in North America; it is alſo of frequent occurrence in Japan and Brazil, in Siberia, Hungary, Norway, Sweden, Saxony, and Cornwall.

Sp. 2. Vitreous copper. *Kupperglas*. *Cuivre vitré*.

Its colour is dark lead-grey, paſſing into blackiſh-grey; it is often covered ſuperficially by a ſteel-coloured tarniſh. It occurs in maſs, diſſeminated or cryſtallized. The forms of its cryſtals are the cube, the octohedron, and a hexahedral priſm, ſometimes terminated by trihedral ſummits. The cryſtals are ſmall; externally they are ſhining, internally they exhibit a gliſtening metallic luſtre. The fracture is fine-grained, uneven, paſſing into conchoidal. It gives a ſhining ſtreak, is blackiſh when pulverized; is ſomewhat brittle, and eaſily frangible. Sp. gr. 4.1.—5.4.

It effervefces with nitrous acid, and when expoſed to the blow-pipe, gives a metallic button of a ſteel-grey colour, and generally attractible by the magnet.

When pure, it appears to be a ſimple ſulphuret of copper, conſiſting, according to Chenevix, of

81	Copper
19	Sulphur
100	

It is generally however mixed with iron in the proportion of from 3 to 6 *per cent.* A ſpecimen from Siberia was analyzed by Klaproth, and afforded

78.5	Copper
18.5	Sulphur
2.25	Iron
0.75	Silex
100.	

It occurs in veins and beds in primitive and ſecondary mountains, accompanied by copper pyrites, and other ores of this metal. It is not very abundant, but is found in various places, eſpecially Cornwall, Hungary, Saxony, Norway, and Siberia.

Sp. 3. Variegated copper. *Buntkupfererz.*

Its colour is intermediate between copper-red, and Tombac-brown; by expoſure to the air it acquires a ſuperficial tarniſh, which is firſt reddiſh, then violet, afterwards blue, and laſtly green. It occurs in maſs, diſſeminated, ſuperficial, or cryſtallized in octohedrons. Internally it is ſhining, with a metallic luſtre. Its fracture is ſmall, and imperfectly conchoidal, paſſing into fine-grained, uneven. It takes a poliſh by friction, and gives a reddiſh coloured ſtreak. It is ſoft, ſomewhat brittle, and eaſily frangible. Sp. gr. 4.9. 5.4.

It effervefces with nitrous acid, and melts readily before the blow-pipe, without vapour or odour. Two ſpecimens, the one from Hitterdahl in Norway, and the other from Rudelſtadt in Siberia, have been analyzed by Klaproth, with the following reſults.

Hitt.	Rud.	
69:5	58.	Copper
19.	19.	Sulphur
7.5	18.	Iron
4.	5.	Oxygen
100.	100.	

This ore occurs in beds, veins, and diſſeminated through rocks, for the moſt part belonging to the claſs of primitive. It is uſually accompanied by vitreous copper, and copper pyrites. It is found in Cornwall, in Hungary, Saxony, Norway, and Sweden.

Sp. 4. Copper pyrites. *Kupferkies. Pyrite cuivreuſe.*

Its colour is deep braſs-yellow, paſſing into gold-yellow. Its ſurface is often iridefcently tarniſhed. It occurs in maſs, diſſeminated, ſuperficial, ſtalactitical, cluſtered, reniform and cryſtallized in tetrahedrons, and the derivative octohedron, and dodecahedron. The cryſtals are uſually very ſmall and imperfect. The ſurface of the cryſtals is ſmooth and ſhining; that of the other varieties is rough and glimmering. The fracture is coarſe or fine-grained, uneven, paſſing into conchoidal, and imperfectly foliated. It is brittle, and with difficulty gives a few feeble ſparks with the ſteel; it may be readily cut by a knife. Sp. gr. 4.—4.1.

When expoſed to the blow-pipe on charcoal, it decrepitates, emits a ſulphureous vapour, and melts into a black globule, which, by further application of the heat, acquires the colour and luſtre of copper. It does not appear that the cryſtallized varieties of this ore have been regularly analyzed, and the proportion of its conſtituent parts cannot be eſtimated from the other varieties, on account of the iron pyrites, with which they are always more or leſs mixed. A ſpecimen analyzed by Lampadius afforded

41.	Copper
17.1	Iron
45.1	Sulphur
103.2	

The richer this ore is in copper, the ſofter it is, and its colour approaches the more to that of gold. It ſeldom, however, in the large way, affords more than 20 *per cent.* of copper. It may readily be diſtinguiſhed from iron pyrites (the only ſubſtance with which it is likely to be confounded) by the pale braſs yellow colour, and ſuperior hardneſs of the latter.

Copper pyrites is the moſt abundant, and moſt generally diffuſed of any of the ores of this metal. It occurs in veins and beds in primitive, tranſition, and ſecondary rocks, in moſt countries of the world.

Sp. 5. White copper. *Weiſs Kupfererz. Mine de cuivre blanche.*

Its colour is intermediate between ſilver-white and braſs-yellow. It occurs in maſs or diſſeminated. Internally it has a ſlight metallic luſtre. Its fracture is ſmall, and fine-grained uneven. It yields readily to the knife, is brittle, and eaſily frangible. Sp. gr. 4.5.

Before the blow-pipe it yields a white ſmoak, and an arſenical odour, and melts into a blackiſh ſlag. According to Henckel it yields about 40 *per cent.* of copper, the reſt being iron, arſenic, and ſulphur.

It occurs in veins and beds, in primitive mountains, and is generally accompanied by copper pyrites and vitreous copper.

It is found in Cornwall, Saxony, Sileſia, Hungary, Siberia, and Chili in South America.

Sp. 6. Grey copper. *Fahlerz. Cuivre gris.*

Its uſual colour is ſteel-grey, which paſſes into iron-black and lead-grey; ſome varieties incline towards yellow and others again preſent ſuperficial irideſcent colours. It occurs in maſs, diſſeminated or inveſting, or cryſtallized in regular tetrahedrons and their modifications. The cryſtals are ſmall, with ſhining ſurfaces. Internally it is gliſtening, or ſhining with a metallic luſtre. The fracture is coarſe, and ſmall-grained, uneven, inclining to imperfectly conchoidal. It gives a black or reddiſh-brown powder. It is moderately hard, brittle, and eaſily frangible. Sp. gr. 4.46.—4.36.

The only neceſſary ingredients of this ſpecies (as appears from an analyſis by Chenevix, of the cryſtallized variety) appear to be copper, iron, and ſulphur in the following proportions, *viz.*

52	Copper
33	Iron
14	Sulphur
99.	

The uncryſtallized varieties, however, generally contain alſo antimony, ſilver, and lead, but in very variable proportions. In ſeveral varieties from Germany, Mr. Chenevix found antimony varying in proportion from 5 to 38 *per cent.* but neither lead nor ſilver. Two ſpecimens, the one from Andreaſberg, and the other from Crannitz, have been analyzed by Klaproth with the following reſults.

Copper	31.36	16
Iron	3.3	13
Sulphur	11.5	10
Antimony	34.09	16
Silver	14.77	2.25
Lead	0.	34.
Silex	0.	2.5
	95.02	93.75

Finally, a ſpecimen from Piedmont has been examined by Napione, and found to conſiſt of

Copper	29.3
Iron	12.1
Sulphur	12.7
Antimony	36.9
Silver	0.7
Arſenic	4.
Alumine	1.1
	96.8

Thoſe ſpecimens that give a reddiſh-brown ſtreak, are generally the moſt abundant in ſilver.

It occurs in veins in ſlate, and ſome other of the neweſt primitive rocks, and in beds in the tranſition and floetz rocks. It is accompanied by copper pyrites, galena, manganeſe, ſpathoſe iron, and rarely by malachite. When it contains a notable proportion of ſilver, it is conſidered and worked as an ore of this metal.

It is found in Cornwall, and in the county of Ayr in Scotland; alſo in Bohemia, Hungary, Tranſylvania, Saxony, Heſſe, the Hartz, France, Spain, Piedmont, Sweden, Norway, Siberia, and Chili.

Sp. 7. Black copper. *Kupperchwartze. Cuivre noir.*

Its colour is intermediate, between blueiſh and browniſh black. It occurs in maſs, diſſeminated or inveſting. It is compoſed of dull moderately cohering particles. It is friable, ſlightly ſoils the fingers, is meagre to the feel, and heavy.

Before the blow-pipe it emits a ſulphureous odour, and melts into a ſlag that colours borax green. It has not been regularly analyzed, but is ſaid to contain from 40 to 50 *per cent.* of copper.

It occurs with other ores of copper, particularly copper pyrites, malachite, mountain green, and vitreous copper.

It is found of remarkable beauty, at Kupperberg, in Sileſia, alſo in Saxony, Hungary, Norway, and Siberia.

Sp. 8. Ruby copper. *Roth. Kuppererz. Cuivre oxydé rouge.*

Of this ſpecies, there are the three following varieties.

Var. 1. Lamellar.

Its colour is dark cochineal red, inclining ſometimes to lead grey; when cryſtallized it is often of a full carmine red. It occurs in maſs, diſſeminated and cryſtallized in cubes, and aluminiform octohedrons. The cryſtals are ſmall, and for the moſt part laterally aggregated: their ſurfaces are ſmooth and ſhining. Its internal luſtre is more or leſs ſhining, and is intermediate between metallic and adamantine. Its fracture is imperfectly foliated, paſſing into granular uneven. When in maſs it is uſually opake, or at moſt tranſlucent on the edges; the cryſtals are tranſparent, verging into tranſlucent. It gives a browniſh brick-red ſtreak, is moderately hard, brittle, and eaſily frangible. Sp. gr. 3.95.

By expoſure to the blow-pipe on charcoal, it is eaſily reducible to a metallic bead, without emitting either odour, or ſmoak. It diſſolves in the nitrous and muriatic acids, in the former with, and in the latter without, efferveſcence. According to Mr. Chenevix, it conſiſts of

88.5	Copper
11.5	Oxygen
100.	

It is met with chiefly in veins, and appears to be peculiar to primitive mountains. It is accompanied by native copper and other ores of this metal. It is found in Cornwall, in Hungary, Saxony, the Hartz, Siberia, Peru, and Chili.

Var. 2. Capillary.

This variety differs from the preceding in being of a ſomewhat lighter colour, ſuperior luſtre, and being compoſed of ſmall capillary cryſtals and thin flakes.

Var. 3. Compact.

It occurs in maſs and diſſeminated, but never cryſtallized. Its internal luſtre is glimmering, ſemi-metallic: its fracture is even; and it is opake. In other reſpects it agrees with var. 1.

Sp. 9. Tile-red copper. *Ziegelerz.*

This ſpecies preſents two varieties, indurated and earthy.

Var. 1. Indurated.

Its colour is intermediate between hyacinth and browniſh-red, paſſing on the one hand into lead-grey, and on the other into reddiſh-brown. It occurs maſſive and diſſeminated. The reddiſh kind has a glimmering luſtre and flat conchoidal fracture; the browner kind has a ſomewhat reſinous luſtre and a ſmall conchoidal fracture. It acquires a luſtre by friction, is moderately hard and brittle.

When expoſed to the blow-pipe it becomes black, and is infuſible without addition. Borax is tinged by it of a dirty green. It appears to be an intimate mixture of compact ruby copper with brown iron ochre, and its produce of copper varies from 10 to 50 *per cent.*

It occurs in veins with ruby copper, malachite, copper pyrites, and iron ochre.

Var. 2. Earthy.

Its colour is hyacinth-red, paſſing into reddiſh or yellowiſh brown. Its texture is between friable and ſolid. It occurs in maſs, diſſeminated, and inveſting copper pyrites. It is without luſtre, has an earthy fracture, and ſlightly ſoils the fingers. In its other characters it agrees with the preceding variety.

Sp. 10. Mountain blue. *Kupperlázar. Cuivre carbonaté bleu.*

Of this there are the two following varieties.

Var. 1. Radiated.

Its principal colour is ſky-blue, which paſſes into Pruſſian and indigo-blue. It occurs in maſs, diſſeminated or inveſting, more frequently botryoidal, ſtalactitic, and cellular, but moſt frequently cryſtallized in oblique rhomboidal priſms or octohedral priſms with dihedral ſummits. The cryſtals are generally very ſmall and aggregated into globular maſſes or bundles. The cryſtallized varieties are externally ſhining, but the reſt are dull. Internally it is ſhining or glittering, with a luſtre between vitreous and reſinous. Its fracture is ſtraight or divergingly radiated, rarely lamellar. The cryſtals are tranſlucent and ſemi-tranſparent, the other varieties are opake, or at moſt tranſlucent on the edges. When pulverized it is of a ſky-blue colour. It is ſoft, brittle, and eaſily frangible. Sp. g. 3.2.—3.4.

It is very difficult of fuſion before the blow-pipe, *per ſe*; but with borax it gives a bright green glaſs, and a metallic globule.

According to Pelletier it conſiſts of

66	to	70	Copper
18	—	20	Carbonic acid
8	—	10	Oxygen
2	—	—	Water

Var. 2. Earthy.

Its colour is ſmalt-blue: it occurs rarely in maſs, generally diſſeminated or ſuperficial: it is compoſed of fine pulverulent cohering dull particles. Its fracture is fine-grained earthy, paſſing into even and imperfectly conchoidal. It is opake, ſlightly ſtains the fingers, and is eaſily frangible.

Before the blow-pipe it becomes black, but does not melt. In borax it diſſolves with great ebullition, and forms a green glaſs.

Mountain-green occurs in the newer primitive rocks, but more commonly in floetz mountains. It accompanies other ores of copper, eſpecially malachite, grey copper, and copper pyrites. The moſt beautiful ſpecimens come from the Bannat in Hungary, and from Siberia. In the Tyrol it is found in ſufficient plenty to be manufactured into the pigment called mountain-blue.

Sp. 11. Malachite.

Of this there are the two following varieties.

Var. 1. Fibrous.

Its common colour is graſs-green paſſing into emerald-green, and ſometimes into dark leek-green. It ſeldom occurs maſſive or diſſeminated, but generally inveſting, and often cryſtallized in ſhort capillary needles, diſpoſed in divergent bundles, or ſtars. Externally they are ſhining, but internally only gliſtening with a ſilky luſtre. Its fracture is delicate, diverging fibrous, paſſing into coarſe fibrous. It is opake or tranſlucent on the edges; the cryſtals are for the moſt part tranſlucent. When pulverized it retains its colour, only the tint is ſomewhat lighter. It is very ſoft, brittle, and eaſily frangible. Sp. gr. 3.5.

It effervеſces with acids, and forms a blue ſolution with ammonia. Before the blow-pipe it blackens and decrepitates, but is infuſible, *per ſe*. With borax it melts into a green glaſs. Its conſtituent parts, according to Klaproth, are

58	Copper
18	Oxygen
12.5	Carbonic acid
11.5	Water
100	

It occurs uſually in the newer primitive and floetz mountains, accompanied by other ores of copper, alſo by carbonat of lead, calcareous ſpar, brown ſpar, and quartz. The fineſt ſpecimens of this variety of malachite are found in the Siberian and Hungarian mines; it occurs alſo in Saxony and other mining diſtricts in Germany, in Norway, and in Shetland, and the counties of Cornwall and Derby in Britain.

Var. 2. Compact.

Its colour is emerald-green paſſing into graſs and verdegris-green, the ſame ſpecimen exhibiting different ſhades of colour: its external ſurface is commonly overſpread with a greeniſh-white cruſt. It occurs maſſive and diſſeminated, but moſt frequently reniform, botryoidal, mamillated, ſtalactitic, or globular. Externally it is rough and dull; internally it is, according to the fracture, either dull, gliſtening, or ſhining. Its fracture is conchoidal, or fine-granular uneven, or minutely fibrous. It generally occurs in thin lamellar concentric diſtinct concretions, each of which has uſually a different ſhade of colour. It is opake, ſoft, brittle, and eaſily frangible. Sp. gr. 3.5.—3.6.

Its chemical characters and component parts are nearly the ſame as thoſe of the preceding variety, with which it alſo agrees in its geognoſtic and geographical ſituation.

Its beautiful colour, luſtre, and the high poliſh that it is capable of receiving, render it much ſought after for various ornamental purpoſes: it would however be much more eſteemed if it was harder.

Sp. 12. Mountain-green. *Kuppergrün. Vert de cuivre.*

Its colour is verdegris-green, paſſing occaſionally into emerald-green and ſky-blue. It occurs in maſs, diſſeminated or inveſting. Internally it is ſhining paſſing into glittering, with a reſinous luſtre. Its fracture is ſmall conchoidal. It is tranſlucent and ſemi-tranſparent; is ſoft and eaſily frangible.

Its chief chemical character is that of giving little or no effervеſcence, while diſſolving in acids. It has not been analyzed. It is found in ſimilar ſituations with malachite, but is of much rarer occurrence.

Sp. 13. Emerald copper. *Kupperſchmaragd. Dioptaſe* of Hauy.

Its colour is emerald-green. It occurs cryſtallized in lengthened dodecahedrons. It is ſhining both externally and internally, and has a vitreous luſtre. It is tranſlucent, paſſing to ſemi-tranſparent; ſcratches glaſs feebly, and with difficulty; is brittle. Sp. gr. 3.3.

Before the blow-pipe it becomes of a cheſnut-brown colour, and is infuſible, *per ſe*. With borax it gives a bead of copper. According to an analyſis by Vauquelin it conſiſts of

25.57	Oxyd of copper
42.85	Carbonat of lime
28.57	Silex
96.99	

It has hitherto been found only in Daouria on the Ruſſian and Chineſe frontiers in a vein accompanied by malachite.

Sp. 14. Micaceous copper. *Kupperglimmer.*

Its colour is deep emerald-green paſſing to verdegris-green. It occurs maſſive, diſſeminated, and cryſtallized in hexahedral tables. Externally it is ſmooth and ſhining with a pearly luſtre. Its fracture is foliated. It is tranſlucent paſſing into ſemi-tranſparent. It is ſofter than calcareous ſpar. Sp. gr. 2.54.

It decrepitates ſtrongly when ſuddenly heated, and is compoſed, according to Chenevix, of

58	Oxyd of copper
21	Arſenic acid
21	Water
100	

[2] It is found in Huel Gorland mine in Cornwall, in veins accompanied by vitreous copper, copper pyrites, arſenical pyrites, and iron ochre.

Sp. 15. Octohedral arſeniat of copper. *Linſenerz* of Werner.

Its colour is deep ſky-blue, paſſing into Pruſſian-blue, blueiſh-white, apple-green, and graſs-green. It occurs in obtuſe pyramidal octohedrons. The cryſtals are ſmall and aggregated into cluſters; they have a ſhining vitreous luſtre, and a lamellar fracture, are ſemi-tranſparent paſſing into tranſparent. In hardneſs they are inferior to fluor ſpar. Sp. gr. 2.88.

It is compoſed, according to Chenevix, of

49	Oxyd of copper
14	Arſenic acid
35	Water
98	

It is found in the ſame mine as the preceding ſpecies.

Sp. 16. Foliated arſeniat of copper. *Blattriges olivenerz* of Werner.

Its colour is olive-green, paſſing to oil and leek-green. It occurs rarely maſſive, and generally cryſtallized in acute rhomboids and oblique quadrilateral priſms. The ſurfaces of the cryſtals are ſmooth and ſhining. Internally it is gliſtening and ſhining, with a diamond luſtre. Its fracture is imperfectly foliated. It is tranſlucent paſſing into tranſparent. It is ſomewhat harder than calcareous ſpar. Its component parts, according to Chenevix, are,

54	Oxyd of copper
30	Arſenic acid
16	Water
100	

It is found in the ſame mine with Sp. 14.

Sp. 17. Fibrous arſeniat of copper. *Faſriges olivenerz.* Werner.

Its colour is browniſh, or dark bottle-green, paſſing into yellowiſh; when capillary it is of a lighter and brighter colour. It occurs cryſtallized in an irregular acute octohedron, or a long compreſſed hexahedral priſm, or capillary. Sometimes the cryſtals are regular at one extremity, and terminate in capillary bruſhes at the other. The cryſtals are ſmall and laterally aggregated. It has a conſiderable luſtre between vitreous and reſinous, is tranſlucent paſſing to tranſparent; is harder than fluor ſpar, but will not ſcratch glaſs. Sp. gr. 4.28. It paſſes into the two following varieties.

1. Amianthiform.

Its colour varies from blueiſh-green to graſs-green, brown-green, ſtraw-yellow, and white. It occurs in extremely minute parallel, or diverging flexible fibres, or thin duſty flexible laminæ, with more or leſs of a ſattiny luſtre.

2. Hæmatitiform.

Its colour is browniſh or whitiſh-yellow. It occurs in flat or mamillated layers, either ſmooth or varied with ſmall rough cryſtalline points.

Its texture is fibrous but very compact, reſembling wood-tin.

The above ſpecies, with its varieties, has been analyzed by Mr. Chenevix, with the following reſult:

Priſmatic.	Capillary.	Hamatiff.	
60.	51.	50.	Oxyd of copper
39.7	29.	29.	Arſenic acid
0.	18.	21.	Water
99.7	98.	100.	

It is found in Huel Gorland mine, in Cornwall.

Sp. 18. Phoſphat of copper.

Its colour is, externally, greyiſh-black; internally, between emerald and verdegris-green. It occurs in maſs, diſſeminated and cryſtallized in rhomboids. The cryſtals are ſmall and very ſmall; their luſtre is externally vitreous and ſhining. Internally, it is gliſtening with a ſilky luſtre. Its fracture is fine and diverging fibrous. It is opake, and moderately hard. It conſiſts, according to Klaproth, of

68.13	Oxyd of copper
30.95	Phoſphoric acid
99.08	

It has hitherto been found only at Firneberg in Cologne, in white druſy quartz.

Sp. 19. Sandy copper. *Saltzkupfererz.* Werner.

Its colour is emerald-green, paſſing into leek and olive-green. It occurs maſſive, diſſeminated, and cryſtallized in extremely minute ſix or four-ſided priſms. The ſurface of the cryſtals is ſmooth and brilliant, and their fracture lamellar. The maſſive variety is opake; the cryſtals are tranſparent. It is ſoft and eaſily frangible. Sp. gr. 4.43.

Before the blow-pipe on charcoal, it tinges the flame of a bright green and blue colour, and a metallic globule remains behind. It is ſoluble in nitrous acid, without efferveſcence. The following are its conſtituent parts, according to Prouſt and Klaproth.

Prouſt.		Klaproth.	
From Peru.	Chili.	Chili.	
76.595	70.482	73.	Oxyd of copper
10.638	11.446	10.1	Muriatic acid
12.767	18.072	16.9	Water
100.	100.	100.	

It is found looſe in the bed of a river at Kernolinos, in Chili, and elſewhere, though rarely in Spaniſh South America.

§ 2. *Aſſay and Analyſis.*

The aſſay of copper ores, (though by no means ſo accurate a method of aſcertaining their metallic contents as a regular analyſis) being the method by which the market price of the ore is always determined, requires the firſt notice. The beſt method, upon the whole, of conducting it, is as follows.

Firſt, expoſe a ſmall piece of the ore, under examination, to the action of the blow-pipe, and by the appearance and odour of the vapour given out, it is eaſy to diſcover whether it contains any arſenic or ſulphur. It may very probably contain both, in which caſe, take 300 grains of the ore coarſely pulverized, mix it with half its weight of ſawduſt, and keep it at a moderate red heat in an earthen crucible, till the diſengagement of arſenical vapour entirely ceaſes. Then pour the contents of the crucible into an iron mortar, and reduce them carefully to a fine powder. Transfer this powder to a teſt, and expoſe it to a good red heat, with occaſional ſtirring, till both the charcoal and ſulphur are burnt off. The reſidue is then to be accurately mixed with $\frac{1}{12}$ of its weight of lamp-black, half its weight of *pulverized* glaſs of borax, and a drop or two of oil; the maſs thus formed, is to be put into a ſound earthen crucible, a cover is to be luted on, and the whole is to be placed in a good wind furnace. The heat ſhould be moderate for the firſt quarter of an hour, to allow the borax time to combine with the earthy impurities of the ore; then a moderate white heat is to be applied for about twenty minutes. After this, the crucible being withdrawn and cooled, is to be carefully broken, and will be found to contain a button of copper, covered by vitreous ſcoriæ. The purity of the copper thus procured, is to be eſtimated from its colour, ſoftneſs, malleability, and tenacity; after which, a part of it may be cupelled with pure lead, in order to aſcertain whether it holds any ſilver or gold. If the ore contains ſulphur, but no arſenic, it may be mixed with half its weight of charcoal, and roaſted on a teſt, without being previouſly heated in the crucible. If the ore contains neither ſulphur nor arſenic, it ſhould be firſt moderately ignited in a covered crucible, to drive off any moiſture, and may then be treated with borax and lamp black, as already deſcribed.

The proper analyſis, by means of liquid menſtrua, is however much more accurate than even the moſt carefully conducted aſſay, and the general mode of proceeding with the ores of copper is, upon the whole, very ſimple. The copper, together with the other metals with which it may happen to be mixed, is to be ſeparated from the ſilex and ſulphur, by means of an acid, the other metals are then to be got rid of by their appropriate reagents, and the copper is then to be procured either in the ſtate of green carbonat, of black oxyd, or of pure metal; of the firſt, 180 parts are equivalent to 100 of metallic copper; and of the ſecond, 100 parts contain 80 of metal.

Previouſly to undertaking an analyſis, a part of the ſpecimen, under examination, ſhould be ſubjected to the uſual reagents, in order to aſcertain not indeed the proportion, but the nature of the ingredients of which it conſiſts; and, in few caſes is this more neceſſary than in the analyſis of the ores of copper, both as they are ſo numerous and ſo various in their compoſition. This previous examination being duly performed, the analyſis may be conducted in the following manner:

For the analyſis of the *pyritical*, and other *ſulphurized ores of copper*, provided they contain neither ſilver nor lead, take 200 grains of the pulverized ore, and digeſt it at a boiling heat with muriatic acid, (adding occaſionally a few drops of nitric acid) till every thing ſoluble in this menſtruum is taken up. Of the inſoluble portion, a part, conſiſting chiefly of ſulphur, will be found floating on the liquor; and this being waſhed, dried, and weighed, is to be ignited on a teſt, by which the ſulphur will be burnt off, and its amount may be eſtimated from the loſs of weight ſuſtained by the proceſs. The incombuſtible reſidue is to be digeſted in a little warm muriatic acid, and what remains inſoluble, is to be added to the other inſoluble reſidue. The muriatic ſolutions being mixed together, the whole is to be decompoſed by carbonated potaſh, and the precipitate, hence reſulting, is to be digeſted in repeated portions of cauſtic ammonia, as long as this latter acquires any blue tinge. The whole of the copper, and nothing elſe, will thus be taken up by the ammonia, from which it may be obtained in the ſtate of black oxyd, by the addition of a little cauſtic potaſh, and a boiling heat. The reſidue, inſoluble in ammonia, conſiſts of oxyd of iron, with perhaps a little alumine, which may be ſeparated by cauſtic potaſh, the alumine alone being ſoluble in this fluid. Finally, the portion inſoluble in muriatic acid, may be conſidered as little elſe than ſilex.

The ores which, beſides *copper*, *ſulphur*, and *iron*, contain *ſilver*, *lead*, and *antimony*, may be thus analyzed. The ore, reduced to fine powder, is to be repeatedly digeſted with moderately diluted nitric acid, as long as any thing continues to be taken up by this menſtruum. To the nitric ſolution is then to be added muriat of ſoda, which will throw down the ſilver in the ſtate of luna cornea; this being ſeparated, the lead is to be precipitated in the form of ſulphat, by ſulphat of ſoda; the ſolution is now to be ſuperſaturated with ammonia, which will diſſolve the copper, and eave behind the oxyd of iron, with probably a little alumine and ſilex. The copper is to be procured from the ammoniacal ſolution, in the manner directed in the preceding paragraph; and the oxyd of iron may be ſeparated from the admixed earths, by cauſtic potaſh. That portion of ore, inſoluble in nitric acid, is to be digeſted in muriatic acid, which will take up every thing except the ſulphur, ſilex, and probably a little luna cornea. Of this inſoluble reſidue, the ſulphur is to be burnt off by gentle ignition, and the remainder is to be fuſed with twice its weight of pearlaſh, by which the ſilver in the luna cornea will be reduced to the metallic ſtate. The muriatic ſolution being concentrated by evaporation, and then poured into a conſiderable quantity of water, will depoſit the antimony in the form of a white oxyd.

The ſimple *oxyds of copper*, are beſt analyzed by digeſtion in nitric acid, and then ſuperſaturating the ſolution with ammonia, by which any caſual admixture of iron will be ſeparated.

The *carbonats of copper* are to be thus treated. One portion is to be gently calcined in a covered crucible, and the loſs of weight ſuſtained, indicates the united amount of the water and carbonic acid. A ſecond portion is to be thrown into a known quantity of dilute ſulphuric acid, and the loſs of weight, by the efferveſcence which enſues, ſhows the amount of carbonic acid. The ſulphat of copper thus obtained, may be ſubſequently decompoſed, either by a ſtick of zinc, or by liquid ammonia.

The *arſeniats of copper* are moſt conveniently analyzed by firſt moderately heating them, in order to drive off and thus eſtimate the water, and then digeſting the reſidue in dilute nitric acid, by which it will be entirely diſſolved; nitrat of lead is then to be dropped in as long as it occaſions any precipitate, and this latter being removed, the fluid is to be evaporated nearly to dryneſs, after which, warm alcohol is to be added, which will take up the whole, except a white powder; this powder, and the precipitate on the addition of nitrated lead, are arſeniat of lead, 33.66 *per cent.* of which is arſenic acid. The alcoholic ſolution is then to be evaporated nearly to dryneſs, and then to be digeſted with ammonia, which will take up the copper, leaving behind any oxyd of iron that may have happened to be contained in the ore. The ammoniuret of copper, being decompoſed by cauſtic potaſh, gives the copper in the ſtate of black oxyd, which is that in which it exiſts in the ore.

The analyſis of *muriat of copper* is very ſimple. It was thus effected by Klaproth. The ore, being pulverized, was diſſolved in cold nitric acid, with the exception of 1.5 *per cent.* of oxyd of iron; the ſolution being then diluted, nitrat of ſilver was added, till it occaſioned no further precipitate; the luna cornea thus obtained, indicated, according to the known proportions of this ſalt, the amount of muriatic acid in the ore. The nitrous ſolution was then decompoſed, and the copper obtained in the metallic form, by means of a bar of iron.

Phoſphat of copper was thus analyzed by Klaproth. On digeſtion in nitric acid, the whole was taken up except a few grains of quartz; the exceſs of acid in the ſolution was then ſaturated by potaſh, and acetite of lead was poured in till it had quite ceaſed to occaſion any precipitate; the phoſphat of lead, thus obtained, was ſeparated from the ſolution, and ſulphat of ſoda was added to decompoſe and precipitate the ſmall exceſs of acetite of lead which had been made uſe of. A little ſulphuric acid was then added to the ſolution, and the copper was precipitated in the uſual way, by means of a bar of iron.

§ 3. *Reduction of Ores.*

The only ores of copper that are in fact wrought in the large way, and from which the copper of commerce is for the moſt part ſupplied, are the ſulphureous and arſenical ores of this metal. The method of reducing them, though conſiſting of a great number of proceſſes, on account of the powerful affinity, both of the arſenic and ſulphur, is yet upon the whole very ſimple, being little more than repeated roaſtings and fuſions, till the metal has acquired the neceſſary ductility, for it is never brought to a ſtate of abſolute purity, and the commoner ſorts contain both arſenic and antimony, in ſuch proportions, as to be wholly unfit for alloying with either gold or ſilver.

The rough ore, if ſimply ſulphureous, is broken into pieces not larger than an egg, and ſeparated as much as poſſible from the adhering earthy impurities; after which, it is piled in large kilns, and heat being applied at the bottom, the whole maſs becomes gradually heated, and a large portion of the ſulphur ſublimes out, and may be either collected by proper flues, or allowed to eſcape; this firſt proceſs occupies about ſix months, at the expiration of which time, the evaporation of the ſulphur ceaſes, and when the ore has cooled ſufficiently, it is in a fit ſtate to be ſmelted.

If, however, the ore is largely combined with arſenic, it is not capable of keeping up a long combuſtion of itſelf, nor is the heat thus generated adequate to the expulſion of the arſenic; a ſomewhat different method, therefore, of roaſting muſt be had recourſe to. For this purpoſe the ore is ſtill more carefully dreſſed than in the former caſe, and is reduced to pieces not larger than a hazle-nut. It is then ſpread on the floor of a large reverberatory furnace, and expoſed to a dull red heat, with frequent ſtirring, in order to offer freſh ſurfaces to the action of the flame. The arſenic and ſulphur by this treatment are rapidly driven off, and in about twelve hours the roaſting is completed.

The ore is now transferred into the fuſing furnace, which is a reverberatory of the common contruction; a little bruiſed lime-ſtone is generally added by way of flux, and in the courſe of four or five hours the fuſion is uſually complete; the ſlag, now of the conſiſtence of ſoft dough, is raked off, and the copper is diſcharged through a plug-hole into water, by which it is reduced into ſmall drops or grains.

The copper, however, though in the metallic ſtate, is ſtill very impure, being largely mixed with ſulphur and arſenic, which give it a grey colour, and render it perfectly brittle. In order to ſeparate theſe impurities, it is re-melted and granulated twice more or oftener, a conſiderable quantity of ſlag being ſeparated at each fuſion; but as this ſlag contains ſome copper it is not thrown away, but worked over again with the next charge of calcined ore. The number of fuſions and granulations entirely depend on the quantity of impurities, and the obſtinacy with which they combine with the copper; but when theſe proceſſes have been repeated the requiſite number of times, the granulated maſs is melted and caſt into pigs. Theſe again are broken to pieces, and roaſted for one or two days in a low red heat, and again melted and roaſted ſeveral times, till the metal approaches to the ſtate of malleable copper. It is now caſt into oblong maſſes, about 14 inches in length, and is fit for the refining furnace. In this it is again melted, with the addition of a little charcoal, till it acquires the neceſſary degree of malleability, and thus becomes ſaleable copper.

Sometimes lead is employed with good effect in the refining of copper, as it combines with, and ſcorifies iron, and the other eaſily oxydable metals in preference to copper. For this purpoſe the rough copper is ſpread on the floor of a furnace, and when it is in complete fuſion, about 6 or 8 *per cent.* of lead is thrown in, and well mixed with the reſt. In a ſhort time the ſurface of the melted metal becomes covered with a ſemi-vitreous blackiſh brown ſcoria, conſiſting of the mixed oxyds of lead, iron, and other impurities, together with a little copper. The firſt ſcoria being removed, a ſecond is formed, which is in like manner ſcummed off, and ſo on ſucceſſively, till, after ten or twelve hours, the copper is ſufficiently purified: this is aſcertained by the thinneſs of the film with which the melted copper is covered, and by its being of a brick-red colour, alſo by the circumſtance that if a rod of poliſhed iron is dipped into the fuſed maſs the portion of copper that adheres to it immediately falls off when the rod is dipped in cold water.

§ 4. *Chemical and Phyſical Properties.*

The colour of copper is yellowiſh-red; its hardneſs is ſuperior to that of ſilver, but ſomewhat inferior to that of platina; it is very tough, ductile, and malleable; hence it may be beaten into plates or drawn into wire of great ſtrength and compactneſs. It breaks with a hackly fracture. When rubbed, it emits a diſagreeable odour; to the taſte it is nauſeous and ſtyptic. The ſpecific gravity of Swediſh copper, which is the pureſt that is met with in commerce, amounts to about 8.89: that of the commoner ſorts does not exceed 8.6; while that of the Japaneſe copper, on the other hand, amounts, according to Bergmann, to 9.0.

The fuſing point of copper is nearly the ſame as that of gold, namely, a low white heat; before it melts, changeable priſmatic colours appear on its ſurface. When in fuſion, or even at a full red heat, if expoſed to the air, it is ſoon covered with a thin brittle plate of browniſh oxyd, that readily ſeparates from the metal when cold.

This ſubſtance is an imperfect oxyd, and was formerly called *copper aſhes*, *æs uſtum*, or *cinis æris*, and by repeatedly heating and cooling a bar of this metal, the whole may be thus changed. Theſe ſcales, according to Prouſt, are compoſed of about 62 *per cent.* of perfect or black oxyd, and 38 of copper nearly in the metallic ſtate; hence, when they are digeſted in cold dilute ſulphuric acid, only the former portion is taken up. By ſubſequent calcination, the ſcales are wholly converted into black oxyd, the weight of which is one-fourth more than that of the original copper. At a very high heat, this oxyd runs into a bright reddiſh-brown opake glaſs.

Copper, when in high fuſion, and in contact with the air, like all the other eaſily oxydable metals, is actually combuſtible; it burns with a beautiful light green flame; the ſame delicate tinge is viſible when a little of the oxyd, or of any of the ſalts of this metal, is ſtrewed on burning coals. The green flame thus produced depoſits a ſmall portion of greeniſh-grey pulverulent oxyd, and hence it gradually collects as a kind of ſoot in the chimnies of furnaces employed in ſmelting this metal.

Copper ſoon ruſts in a damp air, and becomes covered with a green cruſt of carbonated oxyd, but this coating, by its ſtrong adheſion to the metal beneath, long preſerves it from further alteration; hence it requires a length of time, and the concurrence of circumſtances peculiarly unfavourable to preſervation, in order to corrode entirely a thick plate of

this

this metal. Water is not decompoſed by copper even at a white heat.

With the exception of a few caſes, that will be mentioned preſently, copper appears to unite very uniformly with the ſame proportion of oxygen, forming (when uncombined with water and every other ſubſtance) a browniſh-black oxyd, of which one-fifth, or 20 *per cent.*, is oxygen, and the remainder copper. This oxyd is produced, as has been already mentioned, by boiling the precipitate from any of the cupreous ſalts by an alkali, or the ammoniuret of copper, with cauſtic potaſh or ſoda.

Copper, or rather its oxyd, combines with every acid, forming ſalts, many of which are both curious and important.

Sulphuric acid acts upon metallic copper only when concentrated and boiling hot. For this purpoſe take copper filings, or thin ſheet copper, put it into a glaſs veſſel with twice its weight of ſtrong ſulphuric acid, and heat the mixture. As ſoon as it begins to boil, much ſulphureous acid gas is given out, and at length the whole diſſolves into a dark-coloured liquor, which, by dilution with water, becomes of a fine blue. If common copper is uſed for this purpoſe, there always remains a black ſediment, which conſiſts for the moſt part of ſulphuret of copper. If the pure carbonated oxyds are employed, inſtead of the metal, they will be found to be ſoluble even in cold and diluted ſulphuric acid. The ſolution, in whichever way it is formed, depoſits, by evaporation and gradual cooling, rhomboidal cryſtals of a deep ſky-blue colour, which are ſulphat of copper, the *blue* or *Roman vitriol* of the ſhops.

The ſame ſalt is alſo met with native in copper mines, partly cryſtallized, but more generally diſſolved in the water which drains more or leſs into all mines. When native, it appears to be formed in conſequence of the iron pyrites being firſt vitriolized, and the reſulting ſulphat of iron re-acting on the copper.

Sulphat of copper has a very ſtrong, ſtyptic, ſomewhat acidulous, and exceſſively nauſeous taſte. It is ſoluble in about four times its weight of water. When dried at a heat not exceeding that of boiling water, it loſes, according to Prouſt, about 36 *per cent.*, which is mere water, after which the reſidue, which is a white pulverulent maſs, is again ſoluble and cryſtallizable, as at firſt. But if it is calcined with a ſtrong white heat, the acid itſelf is expelled without undergoing decompoſition, and at length there only remains black oxyd of copper, in the proportion of 32 *per cent.* of the original cryſtallized ſalt. Hence 100 parts of ſulphat of copper conſiſt, according to Prouſt, of

Copper 25.6	forming black oxyd	32
Oxygen 6.4		
	Sulphuric acid	32
	Water	36
		100

Bergmann's analyſis of this ſalt nearly agrees with that of Prouſt in the proportion of copper (26 *per cent.*); but of the other ingredients he reckons 28 of water, and 46 of acid.

Beſides the common ſulphat, Prouſt deſcribes a *ſub-ſulphat* of copper. This is prepared by adding to the common ſulphat ſome cauſtic potaſh, but not ſufficient entirely to decompoſe it. A green precipitate is in conſequence depoſited, which is the ſub-ſulphat in queſtion. This ſalt loſes by diſtillation only 14 *per cent.* of water. The reſidue, boiled with cauſtic potaſh, gives 68 *per cent.* of black oxyd; hence its component parts are

Copper 54.4	68
Oxygen 13.6	
Sulphuric acid	18
Water	14
	100

Sulphat of copper is decompoſed by the alkalies, whether pure or carbonated. If either of the fixed alkalies in their cauſtic ſtate is made uſe of, the precipitate is not, as might be ſuppoſed, a ſimple oxyd of copper, but that peculiar combination firſt diſcovered by Prouſt, and named by him *hydrat of copper*. It is thus prepared: to a cold ſolution of ſulphat of copper add liquid potaſh, alſo cold, to complete ſaturation; a *blue* precipitate falls down, which, when thoroughly waſhed with boiling water, is the pure hydrat. Its conſiſtence, when dried at a heat not exceeding 212° Fahr., is nearly that of Pruſſian-blue; at a ſomewhat higher temperature it ſhrinks, and is gradually converted into black oxyd, by the evaporation of its water. By dry diſtillation it is found to give out about 24 *per cent.* of water, and 1 of carbonic acid, which it probably has abſorbed from the air while drying: there remain behind 75 parts of black oxyd. If this latter is again moiſtened with water, it does not return to the ſtate of hydrat. Hence it appears that the hydrat is a true chemical combination of water and oxyd of copper, in the proportion of about one part of the former to three of the latter, and as ſuch enters into the compoſition of the cupreous ſalts. The hydrat is decompoſable not merely by heat, but alſo by *boiling* with either of the fixed alkalies.

Carbonic acid and oxyd of copper unite together without difficulty. This combination is found native, forming the mountain-blue, the malachite, and ſome of the other ores of copper. It may be prepared artificially by expoſing the metal to a damp confined air, in which caſe it conſtitutes ruſt of copper; or more expeditiouſly by decompoſing any of the acid ſalts of copper by a carbonated alkali. A copious bulky precipitate falls down, which, when well waſhed and gently dried, is a fine powder, of a beautiful pale apple-green colour. One hundred parts of copper diſſolved in any acid, and precipitated by carbonated potaſh or ſoda, produce invariably 180 of the green carbonat, dried at a boiling-water heat. This carbonat, when diſtilled by itſelf, with a heat gradually increaſed to redneſs, gives out 10 parts of water, and 46 of carbonic acid; the black oxyd, remaining behind in the retort, amounts to 125 parts, of which 100 are copper, and 25 oxygen.

When hydrat of copper is gently heated with a ſolution of ſuper-carbonated potaſh, a portion is diſſolved, forming a greeniſh-blue liquor, whilſt the undiſſolved reſidue becomes almoſt as dark in colour as the black oxyd. The ſolution, if ſlowly evaporated, yields a ſingular ſalt, conſiſting of 52 *per cent.* potaſh, 43 carbonic acid, and 5 oxyd of copper. It is cryſtallizable and ſlightly deliqueſcent. A ſimilar ſalt, with a baſe of ſoda, is produced, when this latter alkali is employed inſtead of potaſh.

Copper is very readily ſoluble in nitric acid, even when cold and conſiderably diluted. Much heat is excited, and a torrent of nitrous gas given out, the liquor becoming of a bright blue colour in proportion as the copper is diſſolved. The oxyds of copper are equally ſoluble in this acid as the metal is, but without the evolution of nitrous gas. When this ſolution is haſtily evaporated to a certain point, and then ſuffered to cool, it congeals into a deep blue ſaline maſs, which deliquiates rapidly when expoſed to the air. By a ſlow and careful evaporation this ſalt may be obtained in the form of hexahedral priſms, but equally deliqueſcent as the former amorphous variety. If this blue nitrat be evaporated beyond the point at which it would cryſtallize when cold, nitrous gas begins to be produced, and a green ſcaly concretion ſeparates from the thick blue liquor. If the evaporation is here ſtopped, this green matter may be ſeparated by water, either hot or cold, which diſſolves only the undecompoſed blue nitrat. This green ſubſtance is conſidered by Prouſt as a ſubnitrat of copper; that it ſtill contains nitric acid is proved by its ſtill giving out this acid when mixed with ſulphuric acid and heated. By thorough calcination all the acid and water are expelled, and the black oxyd of copper only remains. The proportions of the ſubnitrat, according to the above-mentioned chemiſt, are

Black oxyd of copper	67
Nitric acid - -	16
Water - -	17
	100

The blue or perfect nitrat, on the other hand, contains only 27 *per cent.* of black oxyd.

Nitrat of copper is very ſoluble in alcohol, to the flame of which it communicates a very delicate green colour.

The decompoſition of this nitrat by tin is ſo violent as in certain caſes to produce actual combuſtion. This forms an amuſing experiment, and was, we believe, firſt diſcovered by Dr. Higgins. It is thus performed; ſpread out a piece of tin-foil four or five inches ſquare, lay in the middle a ſmall heap of the ſolid blue nitrat, ſprinkle the ſalt with a few drops of water, ſpread over it a little tow, then double up the tin-foil round it on all ſides, twiſting it as tight as may be without breaking. In a ſhort time the maſs will feel burning hot, ſmall bubbles of blue liquor will be ſeen oozing through, and will preſently be ſucceeded by a copious eruption of nitrous gas, attended by minute ſparks of fire and deflagration.

A fine blue pigment is prepared from nitrated copper, called *verditer (cendres blues, Fr.)* It is made in quantity by the refiners, who, after the proceſs of ſeparating ſilver from gold by aquafortis, recover the ſilver from its ſolution by means of copper, and thus obtain a reſidue of nitrat of copper. This ſolution is decompoſed by lime (the preciſe method of doing which is kept ſecret), and the produce being made into cakes and dried ſlowly conſtitutes the beſt kind of verditer.

This pigment has been analyzed by Pelletier with the following reſults. It was totally ſoluble in nitric and muriatic acids, with a copious effervеſcence of carbonic acid: when diſtilled by itſelf 600 hundred grains loſt 200, and afforded 2 French pints of carbonic acid together with ſome water. The calcined reſidue was a black powder, which, being fuſed with a reducing flux, yielded a button of pure copper, amounting to about half the weight of the original verditer. A freſh parcel was then treated with ſulphuric acid, which afforded ſulphat of lime, the earth of which formed about 7 *per cent.* of the original verditer. Of the 200 grains loſt by diſtillation, Pelletier conſiders 180 as carbonic acid. Hence 100 parts of verditer contain

Copper	50
Carbonic acid	30
Water -	$3\frac{1}{3}$
Lime -	7
	$90\frac{1}{3}$
Remains for oxygen	$9\frac{2}{3}$
	100

But in this eſtimate the amount of carbonic acid is by ſome overſight greatly overrated. The quantity obtained from 600 grains was about 2 French pints, the weight of which, according to Lavoiſier, would be only 66 grains; conſequently 100 grains would yield only 11 grains of this acid. The water was obviouſly only eſtimated at random, and as the copper was in the ſtate of hydrat, certainly amounted to much more than Pelletier has allowed for it. The corrected reſults of the above analyſis therefore would be

Copper	50	83.3	Hydrat of copper
Oxygen	12.5		
Water	20.8		
Lime	-	7.	
Carbonic acid		11.	
		101.3	

which correſponds very cloſely with the quantity analyzed.

The muriatic acid diſſolves copper with difficulty except when concentrated and boiling, and then hydrogen gas is given out. The oxyds, however, of this metal, and eſpecially the green carbonat, are very readily ſoluble in this acid. The colour of muriat of copper when hot or highly concentrated is brown, but by dilution becomes of a graſs-green. By careful evaporation and cooling it cryſtallizes in lengthened rhomboids, and when haſtily evaporated in feathery cryſtals. This ſalt is commonly deliqueſcent, but when both the copper and acid are quite free from iron is permanent in the air. It is readily ſoluble both in water and alcohol; the latter takes up its own weight when boiling, a part of which afterwards ſeparates in a cryſtalline ſtate as the liquor cools. The compoſition of the cryſtallized ſalt is, according to Prouſt,

Black oxyd of copper	40
Muriatic acid -	24
Water - -	36
	100

A dilute ſolution of muriated copper in water makes a kind of ſympathetic ink, which is colourleſs in the cold, becomes yellow by warming, and again loſes its colour on cooling. Beſides the common muriat, the ingenious reſearches of Prouſt have diſcovered a ſecond muriat, in which the copper appears to be at a lower ſtate of oxydation than in the former ſalt. It affords a nearly colourleſs ſolution, and when ſolid is of a greyiſh white; it may therefore without impropriety be called the white muriat of copper. It is prepared from the common muriat by means of muriat of tin, a ſalt remarkable for the eagerneſs with which it abſorbs oxygen from almoſt all the other metallic ſalts. If therefore ſome of this latter is poured into common muriat of copper, a precipitate falls down which is at firſt white, but by ſubſequent expoſure to air paſſes through different ſhades of violet and blue to black. This precipitate is for the moſt part a muriated ſub-oxyd of copper. On expoſure to a moderate heat it melts like luna cornea. If digeſted in warm muriatic acid it readily diſſolves, and is depoſited, on cooling, in the form of tetrahedral cryſtals. With nitrous acid ſome nitrous gas is given out, which ſhews that the metal was not previouſly ſaturated with oxygen. Another remarkable character of this white muriat is, that when diſſolved in ammonia the ſolution is colourleſs, though, on expoſure to the air, it gradually acquires the ſky-blue colour of common ammoniuret of copper. Its compoſition, according to Prouſt, is

Muriatic acid	24.75
Oxyd of tin	1.
Copper -	63.
Oxygen -	11.25
	100.

Aſſuming this analyſis as correct, it is obvious that the copper exiſts in a much lower ſtate of oxygenation in this ſalt than in any hitherto mentioned, for in this the oxyd of copper is compoſed of 63 of metal and 11.25 of oxygen, or (reduced to the hundred) of 84.84 copper, and 15.16 oxygen, whereas the black copper, to which all the common cupreous ſalts are reducible by loſs of their acid and water, conſiſts of 80 *per cent.* copper, and 20 oxygen.

There appears to be yet another ſtate of combination of muriatic acid and oxyd of copper, alſo firſt noticed by Prouſt. It is the *ſubmuriat of copper*, differing from the common muriat not by a lower degree of oxygenation in the metal, but in a ſmaller proportion of acid. It is produced by adding a little potaſh (leſs than required for ſaturation) to the green muriat. A green powder falls down, which is the ſubmuriat in queſtion. This ſalt when boiled with potaſh loſes about 28 *per cent.* of its weight, and is reduced to the black oxyd. A ſimilar ſubmuriat is ſaid by the ſame chemiſt to be ſpontaneouſly depoſited when copper is diſſolved in nitro-muriatic acid. The compoſition of this laſt is as follows:

Black oxyd of copper	79.
Muriatic acid -	12.5
Water - - -	8.5
	100.

The native green muriat of copper from Peru appears to be nearly in this ſtate.

Copper ſeems to have a ſtronger affinity for muriatic acid than even for the nitric or ſulphuric. Thus, if either the ſolid nitrat or ſulphat of copper be digeſted in muriatic acid a ſolution takes place, and then, on the application of heat, the liquor immediately loſes the blue colour, characteriſtic of theſe two ſalts, and acquires the green of the muriat: alſo by ſlow evaporation muriat of copper is obtained in cryſtals.

Acetous acid has no action on reguline copper, but its oxyd is eaſily ſoluble in this fluid, to which it communicates a beautiful graſs-green colour. There are two ſpecies of acetited copper, the one with an exceſs of baſe, the common verdegris of the ſhops, and the other in which the acid and oxyd are in a ſtate of mutual ſaturation, forming the cryſtallized or diſtilled verdegris.

The manufacture of verdegris is carried on to a conſiderable extent in moſt of the ſouthern provinces of France, and a very exact account, apparently, of the proceſs has been publiſhed by Chaptal, from which the following particulars are extracted.

The materials for this manufacture are the *marc* or cake that remains in the wine-preſs, after the greater part of the juice has been ſqueezed out; and plates of copper of convenient ſize and hammered well, in order to ſmooth the ſurface, that the corroded portion may be readily detached from the reſt.

The marc of the grape is firſt fermented by being laid as lightly as poſſible in a large barrel and moiſtened with common wine, and then ſet in a warm airy place. In a few days, varying according to the heat of the weather, it begins to ſwell, grows hot and exhales a ſtrong odour of vinegar; the fermentation then declines and the marc is fit for uſe. A layer of this is then put into an earthen pot and a plate of copper, previouſly made ſcorching hot, is laid upon it; to this ſucceeds another layer of marc, and then a plate of copper, in regular alternation till the pot is filled, obſerving that both the top and bottom layers are of marc. The mouth of the pot is then looſely ſtopped with ſtraw, and the whole is left at reſt from ten to twenty days.

When the marc begins to whiten the pots are unpacked, and, if the proceſs has gone on well, the copper-plates are found covered with a green cruſt, interſperſed with ſilky green cryſtals. The marc is thrown away; the plates are ſet on end on wooden racks in a cellar, and when dry are dipped in water and again ſet to dry; this is repeated once a week for ſix or eight times, which makes the cruſt of oxyd ſwell and increaſe both in quantity and quality: after which it is ſcraped off by a knife without difficulty. Each pot yields about 5 or 6lbs. of rough verdegris, and the plates will ſerve again repeatedly till they are corroded quite through.

This rough verdegris is further prepared for market by being ground in wooden mortars, and expoſed to the air till it is ſufficiently dry; and in ſo doing it loſes about half its weight.

Verdegris thus prepared, may be conſidered as copper oxydated by the action of the acetous acid, and combined with water, with carbonic acid, and with part of the extractive or mucilaginous part of the marc. It is nearly inſoluble in water and its colour is blueiſh green. If this verdegris is digeſted in diſtilled vinegar it diſſolves readily in this fluid, and by evaporation and cooling a cryſtallized ſalt of a deep green colour may be obtained, which is known in the ſhops by the name of *diſtilled verdegris.* The method in which this valuable ſalt is prepared at Montpellier is as follows. Common vinegar is firſt diſtilled in a copper alembic, and the acid thus produced is put with common verdegris into a copper boiler; when a hot ſaturated ſolution is thus made, it is ſtrained and transferred to another copper evaporating veſſel, where it is boiled down till a ſaline cruſt begins to collect on its ſurface; a light frame of croſs ſticks is now ſunk into the liquor and the fire is put out. On cooling, the acetite of copper cruſts round the ſticks in cluſters of rhomboidal cryſtals of a deep blueiſh-green colour. It requires about 3lbs. of verdegris to make 1lb. of the cryſtallized acetite.

The compoſition of common verdegris is ſubject (as might be expected from the method in which it is prepared) to a conſiderable variation, and this difference is ſtill further increaſed by variations in the way of manufacturing this ſalt. Thus, at Grenoble, verdegris is made merely by diſpoſing plates of copper in a proper room, and moiſtening their ſurfaces repeatedly with diſtilled vinegar, till the incruſtation of oxyd acquires a proper thickneſs. Hence this latter is purer, and approaches nearer to the ſtate of cryſtallized acetite, than that of Montpellier.

A hundred parts of the verdegris of Grenoble yield, according to Chaptal, by dry diſtillation,

Carbonic acid	- - -	9.1
Water weakly acidulous	-	13.05
Strong, and coloured acetous acid		53.95

To the above particulars may be added ſome obſervations, by Prouſt, on the properties and compoſition of this ſalt.

When common verdegris is put into cold water, it gradually falls to pieces and nearly half of it is diſſolved, the remainder is a fine green powder which diffuſes itſelf through the liquor and ſubſides very ſlowly. This green powder appears to be pure ſubacetite of copper, and when waſhed and dried weighs about 42 *per cent.* of the original verdegris. When ſulphuric acid is poured on it, pungent vapours of vinegar are given out. Boiled with potaſh it affords 63 *per cent.* of black oxyd; and when diſtilled, after all the volatile products have paſſed over, there remains about 52 *per cent.* of copper, principally in the metallic ſtate. From theſe data therefore the ſubacetite appears to conſiſt of

Copper	50.4	forming black oxyd	63
Oxygen	12.6		
		Remains for acid and water	37
			100

With regard to the cryſtallized acetite, Prouſt found that 39 parts of black oxyd produce, with diſtilled vinegar, 100 parts of acetite; and on the other hand, that 100 parts of this ſalt, when decompoſed by boiling with potaſh, yield 39 or 40 parts of black oxyd. Hence it is compoſed of

Copper	31.2	forming black oxyd	39
Oxygen	7.8		
Acetous acid		- - - -	61
			100

The diſtillation of the cryſtallized acetite furniſhes the moſt pungent acetic acid, or radical vinegar, as has been already deſcribed under ACETOUS ACID. Acetite of copper, beſide being made by direct combination of its ingredients, may be prepared in various ways by double affinity; of theſe the beſt upon the whole is the following: Make a cold ſolution of ſugar of lead *(acetite of lead)* in diſtilled water, to which add, by degrees, a cold ſolution of blue vitriol *(ſulphat of copper)*, as long as any precipitation takes place; then pour the whole on a filter, and a green liquor paſſes through, the ſulphat of lead remaining on the filter, in the form of a white powder. The green liquor, being concentrated by evaporation, depoſits, by cooling, very pure and beautiful cryſtals of acetite of copper.

The natural combinations of copper with arſenic and arſenic acid have already been noticed. With regard to the artificial arſeniats, Scheele diſcovered that when arſenic acid is digeſted with copper filings, a green ſolution is formed, and a blue powder, which is alſo an arſeniat, is precipitated. The ſulphat, nitrat, and muriat of copper undergo no apparent change, when added to arſenic acid; but the acetite is decompoſed, and arſeniat of copper is precipitated. All the cupreous ſalts, however, are decompoſed by arſeniated alkali, and a blue arſeniat falls down. To theſe facts Mr. Chenevix has added the following: If arſeniat of ammonia and nitrat of copper are added, there falls down a blue cryſtalline arſeniat of copper. On evaporating the ſupernatant liquor, and adding alcohol, another copious depoſition of cryſtals took place, of a deeper colour than the former, and of a rhomboidal ſhape. Each of theſe arſeniats was examined ſeparately, firſt by calcination at a low red heat to expel the water, then by potaſh for the black oxyd of copper, and laſtly by nitrat of lead for the arſenic acid. By this method, the firſt arſeniat was found to conſiſt of

The ſecond arſeniat afforded

Oxyd of copper -	35.
Arſenic acid -	39.5
Water - -	24.
	98.5

Arſenic, in the ſtate of white oxyd, combines with oxyd of copper into a pale green powder, called, from its diſcoverer, *Scheele's green.* It is prepared in the following manner: Diſſolve 24 ounces of ſulphat of copper in water, and heat the ſolution in a copper veſſel; alſo boil in another veſſel 24 ounces of pearlaſh, 11 ounces of white arſenic, and about 3 pints of water: when the whole is diſſolved, ſtrain each ſolution ſeparately through linen, and then add the arſenicated potaſh, little by little, to the ſulphat of copper, with conſtant ſtirring: an efferveſcence will take place, and then a green powder will be depoſited. When the whole is mixed, let it ſtand ſome hours, then ſeparate the precipitate by the filter, edulcorate it well with clear hot water, and dry it very gently in a warm room. The above quantity of ingredients will afford about 18½ ounces of the powder, which may be uſed as a pigment.

Phoſphat of copper may be prepared by adding phoſphat of ſoda to the nitrat, or any other readily ſoluble ſalt of copper, a blueiſh-green ſediment falls to the bottom, which dries to a powdery ſemi-cryſtalline maſs. A low red heat turns it brown, and drives off about 15.5 *per cent.* of water: there remains a phoſphat of copper, compoſed of 35 parts of phoſphoric acid, and 49.5 of oxyd of copper.

A ſtriking decompoſition of nitrat of copper alſo takes place, when a ſtick of freſh melted phoſphorus is immerſed in a ſolution of this ſalt, and expoſed to the light. By degrees the copper is precipitated on the ſurface of the phoſphorus, in the metallic ſalt, and in the form of cryſtalline grains.

All the ſalts of copper are decompoſed by the alkalin pruſſiats, and the reſult is a ſediment of a reddiſh-brown colour, which, by drying and expoſure to the air, acquires a dark chocolate hue. This pruſſiat of copper mixed well with oil, and has been employed with ſome ſucceſs as a pigment.

Tincture or infuſion of galls throws down from all cupreous ſolutions a precipitate of a dirty yellow colour.

Oxyd of copper is ſoluble in all the other acids, forming with them, however, ſalts little known, and of little importance: the predominating colour in all of them is green.

Of the alkalies, neither potaſh nor ſoda have any action on copper or its oxyds, except that already mentioned, of taking away from the hydrat its water of combination, and reducing it to black oxyd.

Ammonia has no action on metallic copper, but diſſolves its oxyds without difficulty. The uſual colour of this ſolution is a deep blue-purple. The moſt direct method of preparing it is by digeſting together liquid ammonia and any oxyd, or carbonated oxyd of copper: the liquor becomes blue almoſt immediately, and its colour deepens till ſaturation takes place. By ſlow and careful evaporation, blue ſilky cryſtals of ammoniuret of copper may be procured. This ſalt, by expoſure to the air, gradually loſes its alkali, and abſorbs carbonic acid, ſo that at length it is wholly converted into green carbonat. The *aqua ſapphirina* of pharmacy and ſurgery conſiſts, for the moſt part, of ammoniated copper, to which its colour is owing: it is made chiefly in two ways. The firſt is to digeſt in a glaſs veſſel quick-lime, muriat of ammonia, verdegris, and water; the lime decompoſes the muriat of ammonia, diſengaging the alkali, which, in its turn, decompoſes the verdegris, and diſſolves the oxyd of copper: hence the clear liquor conſiſts of ammoniated copper and muriat of lime. The ſecond method, where a weaker ſolution is wanted, is to employ lime-water inſtead of lime. Another way of producing ammoniated copper immediately is to ſuperſaturate with this acid any of the ſalts of copper, in conſequence of which the firſt portions of alkali decompoſe the cupreous ſalt, throwing down an oxyd, and the ſucceeding portions rediſſolve the oxyd, forming a dark-blue ſolution. As there is no other metal beſides copper and nickel which produces this particular colour, and as the latter of theſe metals is not common, the production of this beautiful tinge, by the addition of ammonia, may be conſidered as a very probable indication of the preſence of copper.

A ſingular circumſtance takes place with regard to ammoniated copper. If a bottle be filled with liquid ammonia, and a few clean copper filings be added, no ſolution enſues, as long as the bottle is kept cloſe corked. But if the bottle be opened for a while, and then ſhut again, a ſolution indeed of part of the copper takes place, but without any change of colour in the liquor: but when the bottle is again opened, the characteriſtic blue tinge appears firſt at the ſurface of the ſolution, and gradually ſpreads down to the bottom. If now a few more copper filings be added, and the bottle again corked, the ſolution will in a ſhort time again become colourleſs, and continue ſo till it is again expoſed to the air. The reaſon of theſe changes appears to be the following: copper requires ſome, but only a very ſmall quantity, of oxygen to be ſoluble in ammonia; and when in this loweſt ſtate of oxydation, it forms with ammonia a colourleſs ſolution, as it forms with muriatic acid a white ſub-muriat: but if this ſolution is expoſed to the air, the metal abſorbs oxygen, and is thus brought to that ſtate in which it tinges ammonia blue; being again ſhut up with a few copper filings, the oxygen is partly abſorbed by the recently added metal, and reduces the whole to the ſtate of white oxyd.

Many of the neutral ſalts, eſpecially the muriats, are capable of oxydating, and, in part, of diſſolving copper: this is eſpecially the caſe with muriat of ammonia, which, when made into a maſs with copper filings and a little water, and kept warm, preſently converts the copper into a green muriated oxyd.

Copper and ſulphur readily unite. If equal parts of copper filings and flowers of ſulphur are mixed and heated in a crucible, much of the ſulphur burns off; but the remainder melts into a blueiſh-black maſs, which is ſulphuret of copper. According to Prouſt, 100 parts of copper take up in this way 28 of ſulphur; ſo that the ſulphuret is compoſed of about 79 of metallic copper, and 21 of ſulphur. No oxygen appears to be preſent. This ſubſtance is more fuſible than copper, melting readily at a red heat. By roaſting in the open air, the ſulphur is expelled: the laſt portions, however, adhere with great obſtinacy. According to Dr. Thomſon, ſulphur and copper filings unite together, by being merely mixed together with or without water, and expoſed for a long time to the air.

Hydroſulphureted water, or any of the liquid hydroſulphurets, when added to the ſolutions of copper, produce a deep blueiſh-black precipitate, which is a hydroſulphuret of copper.

Phoſphorus is capable of intimate combination with copper. If 8 parts of this metal in filings, 8 of vitreous phoſphoric acid, and 1 of charcoal powder, are intimately mixed together, and then put into a crucible, and expoſed to an intenſe heat, the phoſphoric acid is decompoſed by the action of the charcoal, and the phoſphorus in part burns off, and in part unites with the copper, forming a hard, ſteel-grey, brittle alloy, capable of a high poliſh. A ſimpler way of preparing the ſame is to make copper filings red hot in a crucible, and project upon them ſmall pieces of phoſphorus, which combines with the metal, and melts down into a grey maſs, ſimilar to the former. One hundred parts of copper may thus be increaſed to about 120; but if this phoſphuret is kept for ſome time melted under charcoal powder, or melted glaſs, part of the phoſphorus burns off. When this exceſs is thus got rid of, the ingredients of the remaining phoſphuret appear to be in a ſtate of mutual ſaturation, no more phoſphorus being diſſipated by a continuation of the fuſion. In this ſtate the maſs appears to conſiſt of 92.3 of copper, and 7.7 of phoſphorus: it retains the grain and colour of ſteel, is ſuſceptible of a high poliſh, and does not readily tarniſh in the air, but is brittle. With a ſtill leſs proportion of phoſphorus, it becomes malleable, and of a yellowiſh-white colour. Phoſphuret of copper, if kept in fuſion, with free expoſure to the air, loſes gradually moſt of its phoſphorus, which burns away with the bright flame and odour peculiar to this ſubſtance.

The fixed oils, when kept long in contact with copper, oxydate it, and diſſolve a portion, by which they acquire a green colour.

The uſes of copper, in its various ſtates, are ſo numerous and important, as to be ſcarcely inferior to thoſe of iron. All the ſalts of copper are more or leſs poiſonous, producing violent nauſea, with ſevere pain and inflammation of the inteſtinal canal. Yet from the ſudden vomiting that they excite, a large doſe may be given with ſafety; and this is ſometimes done, when there is an immediate neceſſity of emptying the ſtomach. Copper, however, is very little uſed medicinally in any form.

§ 5. *Alloys of Copper.*

The alloys of copper are, upon the whole, of more importance than thoſe of any other metal: we ſhall, therefore, treat of them with ſome minuteneſs.

Copper with gold and ſilver.

Copper, when added in ſmall quantity to either of theſe metals, greatly increaſes their hardneſs, without materially debaſing their colour or malleability: hence it has been generally adopted as the alloy for that portion of the precious metals which is employed with current coin, and for plate.

Copper with arſenic.

On account of the volatility of arſenic ſome precautions are required in the preparation of this alloy. The beſt way, upon the whole, is to melt ſome copper in rather a large crucible, and then to wrap up in paper ſome reguline arſenic, or white arſenic, either with or without a mixture of charcoal powder, and to immerſe the paper, with its contents, in the melted copper, either by means of a pair of long tongs, or by ramming the paper into a ſmall crucible, and then inverting the crucible in the fluid metal. The arſenic preſently riſes through the copper in denſe white fumes, and is in a great part diſſipated; a portion however is retained by the copper, and by repeating the proceſs once or twice more, the alloy will be fully ſaturated with arſenic.

This alloy is of a ſilvery white colour and a cloſe texture; it is however very brittle, and, in proportion to the perfect whiteneſs of its colour, liable to tarniſh in the air. As ſoon as it is brought to fuſion the arſenic begins to eſcape, and the copper regains its malleability: the laſt portions however of arſenic are not driven off even by long continued heat, and although the copper regains its malleability, its colour remains of a dingy yellow.

Vauquelin has diſcovered that if to an alloy of copper and ſilver, in equal proportions (the colour of which is a pale yellow), there be added 2 *per cent.* of arſenic, the reſult is a perfectly white ductile and malleable alloy. If this latter ingredient exceeds 5 *per cent.* the alloy begins to be brittle.

Copper with iron.

Theſe two metals only unite when the former of them is greatly in exceſs. The reſult is a hard, grey, and ſomewhat brittle alloy. According to Mr. Keir, the *tutenag* of the Chineſe is a white alloy of copper, zinc, and iron: it is hard, tough, and ſufficiently malleable to be wrought into candleſticks and various other articles of domeſtic furniture, which take a high poliſh, and are ſcarcely to be diſtinguiſhed from ſilver. The inferior ſort of tutenag has, however, a very perceptible braſſy tinge.

According to Dizé, the alloy of iron and copper only ceaſes to be acted on by the magnet, when the proportion of the former is leſs than $\frac{1}{16}$ of the whole maſs. Iron is much inferior in its power of whitening copper to tin or even to arſenic.

Copper with lead.

Theſe metals unite, to appearance, very intimately by fuſion; but when a maſs of this alloy is expoſed to a very low red heat, the greater part of the lead, with a ſmall portion of copper, ſweats out, leaving the reſt in a porous honeycombed ſtate. When the copper holds a little ſilver, the lead carries the latter out with it: this proceſs is called *eliquation,* and will be treated of more at large in the article Silver. Copper, with about a fourth of its weight of lead, forms *pot-metal.* The Roman pot-metal was compoſed, according to Pliny, of 100 parts copper, 2 lead, and 2 tin. The ſame ingredients, but with larger proportions of the two latter, were the materials of many of the ancient Greek and Sicilian coins, as appears from analyſes of them by Klaproth.

Copper with zinc.

Copper, when nearly ſaturated with zinc, that is, when the latter amounts to about one-fourth of the alloy, forms *braſs,* of which an account has been already given. With a ſmaller proportion of zinc, the colour of the alloy approaches more nearly to that of gold, and its malleability increaſes. Mixtures, chiefly of theſe two metals, are employed to form a variety of gold coloured alloys, known by the names of *tombac, Manheim* or *Dutch gold, tinſel, ſimilor, prince Rupert's metal, pinchbeck,* &c. the preciſe compoſition of which varies according to the fancy or experience of different artiſts. The Dutch gold may be beaten into extremely fine leaves, which when freſh are a cheap and good imitation of gold leaf; but they tarniſh very ſoon. The mixture may be made either by melting together copper and zinc, or copper and braſs. In either caſe the copper ſhould be melted firſt, and the other ingredient added afterwards: being then carefully ſtirred together with a ſtick, the alloy is to be poured out into proper moulds without loſs of time, leſt the zinc ſhould burn off.

A fine malleable tombac may be made with 16 parts of copper, one of zinc, and one of tin; if a larger proportion of this latter is added, the alloy becomes harder and brittle. Several Roman coins ſtruck, during the firſt century of the emperors, have been analyzed by Klaproth, and appear to conſiſt, ſome of nearly pure copper, others of copper, with from a fifth to a ſixth of zinc. A little tin and lead were found in ſome, but in ſuch ſmall proportions as to appear only an accidental impurity.

Copper with tin.

The alloy of copper and tin are extremely important in the arts, and curious as chemical mixtures. Tin added to copper makes it more fuſible, leſs liable to ruſt or be corroded by the air and other common ſubſtances, harder, denſer, and more ſonorous. In theſe reſpects the alloy has a real advantage over unmixed copper; but this is in many caſes more than counterbalanced by the great brittleneſs which even a moderate portion of tin imparts, and which is a ſingular circumſtance, conſidering how very malleable both metals are before mixture.

The ſenſible qualities of the different mixtures of theſe two metals are the following: Copper, alloyed with from one to five *per cent.* of tin, is much harder than before; its colour is yellow, with a caſt of red, and its fracture is granular: it is ſtill conſiderably malleable. This appears to be the uſual compoſition of many of the ancient edged tools and weapons before the uſe of iron; whence it appears that the ancients did not poſſeſs (as has often been ſuppoſed) any peculiar art of hardening pure copper, otherwiſe than by mixture. An alloy in which the tin is from $\frac{1}{10}$ to $\frac{1}{5}$ of the whole is hard, brittle; but ſtill a little malleable, cloſe-grained, and yellowiſh-white. When the tin is as much as $\frac{1}{6}$ of the maſs, it is entirely brittle, and continues ſo in every higher proportion. The yellowneſs of the alloy is not entirely loſt till the tin amounts to $\frac{7}{25}$ of the whole.

Copper (or ſometimes copper with a little zinc) alloyed with as much tin as will make from about $\frac{1}{10}$ to $\frac{1}{5}$ of the whole, forms an alloy which is principally employed for bells, braſs cannon (ſo called), bronze ſtatues, and various other purpoſes. Hence it is called *bronze* or *bell-metal,* and is excellently fitted for the uſes to which it is applied by its hardneſs, denſity, ſonorouſneſs, and fuſibility. For cannon a lower proportion of tin is commonly uſed. According to Dr. Watſon, the metal employed at Woolwich conſiſts of 100 parts of copper, and from 8 to 12 of tin; hence it retains ſome little malleability, and therefore is tougher than it would be with a larger portion of tin. A common alloy for bell-metal is 80 of copper and 20 of tin; ſome artiſts add to theſe ingredients zinc, antimony, and ſilver, in ſmall proportions, all of which certainly improve the ſonorouſneſs of the compound.

When in an alloy of copper and tin, the latter metal amounts to about ⅓ of the maſs, the reſult is a beautifully white alloy, with a luſtre almoſt equal to that of mercury; extremely hard, very cloſe-grained, and perfectly brittle. It takes an exquiſite poliſh, which well adapts it for the reflection of light for all optical purpoſes. It is called *ſpeculum metal*, and, beſides the above ingredients, generally contains a little arſenic, zinc, or ſilver. The application of an alloy, ſimilar to the above, to the conſtruction of mirrors, is of great antiquity, being mentioned by Pliny. From the actual analyſis, by Klaproth, of a portion of an ancient ſpeculum, it appeared to conſiſt of

Copper	62
Tin	32
Lead	8
	102

Of theſe ingredients the laſt is conſidered by Klaproth, with high probability, as only a caſual adulteration of the tin.

When the amount of the tin exceeds that of the copper, the alloy begins to loſe its ſplendid whiteneſs, and acquires a blueiſh-grey hue; its texture likewiſe becomes rough-grained, and, as it were, rotten and incapable of receiving a poliſh.

A perfect ſpeculum metal ſhould be quite white, without ſhewing any caſt of yellow when poliſhed, not very liable to tarniſh, quite free from pores, even when examined by a lens, of a certain coherence or toughneſs to bear the grinder, and, for the convenience of working, as ſoft as may be conſiſtent with the other requiſites.

Mr. Mudge, whoſe ſpecula were celebrated for their goodneſs, obſerves, that the extreme of whiteneſs is given by 32 parts of copper and 16 of tin, but this compound is too hard and brittle; 32 parts of copper with 14½ of tin form an alloy quite white, and as hard as can be wrought. In order that the metal ſhould turn out free from pores, it ought to be twice fuſed, once for mixture of the ingredients, and afterwards, with as little heat as poſſible, for caſting.

The following obſervations on the ſame ſubject are extracted from an elaborate paper by Mr. Edwards, publiſhed in the Nautical Almanack for 1787.

The quality of the copper ſhould firſt be tried by adding ſucceſſively from ſo much ſhort of half of its weight of tin, that the mixture proves a little yellow, to the full half of tin, and by compariſon of the various ſamples aſcertaining the *maximum* of whiteneſs. When this is found, take 32 parts of copper, melt it, then add one part of braſs and the ſame of ſilver, with a little black flux to cover the ſurface; when theſe are melted ſtir them together with a wooden rod, and pour in from 15 to 16 parts of tin (as aſcertained by previous experiment) fuſed in a ſeparate crucible, at a low heat; then ſtir the mixture again, and immediately pour it into cold water. Re-melt, with as little heat as poſſible, the alloy thus formed, and for every 16 parts take one of white arſenic, wrap it in paper, thruſt the packet to the bottom of the fluid metal with a wooden rod, and ſtir it well as long as any arſenical vapours ariſe; when theſe ceaſe pour the metal into a mould of ſand, and as ſoon as it has ſolidified lay it in a pot full of very hot embers, and cool it very ſlowly: unleſs this precaution is particularly obſerved, the metal will fly in pieces when cold, or will ſplit in the poliſhing.

The braſs, the ſilver, and the arſenic in this compoſition appear to have their diſtinct uſe; the braſs makes the mixture tougher, and ſomewhat ſoftiſh, the ſilver improves its colour, and the arſenic renders the texture remarkably finer, cloſer, and leſs porous; a larger proportion of this however would make the metal liable to tarniſh

Sir J. Newton's ſpecula were compoſed of 6 parts of copper, 2 tin, and 1 arſenic; they are upon the whole very good; but after being poliſhed exhibit a rather yellow caſt.

The other alloys of copper are not of much importance, and will be found under the reſpective metals to which they belong.

Copper, *white*, a kind of metal white as ſilver; frequently brought from China, and ſuppoſed by many to be natural. But it is only an allay of copper, zinc, and arſenic, in certain proportions. It is made with difficulty, becauſe of the volatility of the two ſemi-metals; and, as its quality is noxious, it is not much uſed.

Copper, in *Military Affairs.* No other metal is allowed in magazines, or for barrels of gun-powder.

Copper, in *Calico-Printing*, a veſſel in which the operations of dyeing, dunging, rinſing, &c. are performed, and which derives its name from the material it is generally conſtructed of. As theſe veſſels are uſed indifferently for any of the above purpoſes, their ſize, form, and arrangement, are generally the ſame, and vary little throughout the whole kingdom. They are always circular, from 4½ to 5 feet diameter at the top; 3½ to four feet deep, and about the ſame in width, acroſs the bottom, which is the thickeſt and ſtouteſt part of the veſſel. This circular form, though in general uſe, is perhaps the worſt that could have been deviſed for the purpoſe of calico-printing. It is no doubt the firſt that was employed, and has advantages in point of ſolidity of form, and eaſe of tranſportation from one place to another, over any other. For the purpoſe of dyeing, however, or any operations where goods are kept for a long time at a boiling heat, and turned over the winch, it is the moſt inconvenient that could have been adopted.

In a veſſel of this ſize and form, it is cuſtomary to dye from ſix to twelve pieces of twenty-eight yards each, at one operation. The goods are diſpoſed either in two lengths of four or ſix over the winch; or, when quick turning is neceſſary, in one length only, in which caſe, ſix pieces, or at moſt eight, are diſpoſed equally over the whole ſurface of the winch. In this latter caſe, the inconvenience of the circular form is particularly felt. It is evident that when ſix or more pieces are crowded upon a winch, thoſe which are at the extremities will have little or no ſpace in which to float, without diſturbing thoſe which are nearer the centre; whilſt, on the other hand, thoſe which are in the middle will have more than ſufficient, and will float in the copper, ſcarcely ever touching its ſides. In conſequence of this, the pieces at the extremities of the winch, being crowded, will preſs along the ſides of the copper, and thus be expoſed to greater heat and hazard of copper-marking, than thoſe which are in the middle. Their diſpoſition on the winch will alſo be deranged, and the copper-man, with all his care and attention, will be unable to preſerve that order and regularity in the diſtribution of their folds, ſo eſſentially requiſite in good dyeing. When the copper is in a ſtate of ebullition, theſe evils increaſe, and it rarely happens that the moſt experienced dyer can keep his goods diſengaged, or prevent their getting completely faſtened, when he has two lengths of ſix over the winch, and keeps them twenty or thirty minutes at an actual boil.

By adopting a ſquare, or, what is ſtill better, an oblong veſſel of the ſame capacity as the former, theſe inconveniences are in a great meaſure done away; the goods have all equal ſpace to float in, are equally removed from the centre and ſides of the veſſel, and preſerve their order and diſpoſition on the winch, even in a ſtate of ebullition, with eaſe, certainty, and comparatively trifling attention.

Dye-coppers are generally ſet up in brick work, with each their ſeparate and diſtinct fire-place, chimney, &c.

The ſame principles apply to the heating of theſe veſſels as to all other boilers, but we need not enter here upon a ſubject which will be more fully treated of in another part of this work. The recent improvements in the application of ſteam, as a vehicle of heat, are however of ſuch importance, and have at this moment excited ſuch general intereſt amongſt dyers, and calico-printers, as to claim a ſhort notice in this place.

Mr Gott, of Leeds, was the firſt who applied ſteam in the large way, to the heating of dye-coppers, and the ſucceſs of his experiment was ſo complete, as to induce many others to follow his example. This mode, which is the ſimpleſt and moſt economical that can be employed, conſiſts in throwing the ſteam directly into the dyeing veſſel. One ſteam boiler, ſituated at the extremity of the building, ſupplies his numerous coppers which are diſpoſed promiſcuouſly about the dye-houſe, unincumbered with fire-places, aſh-pits, chimneys, &c. and ſimply ſurrounded with a caſing of brick, to ſupport the copper, and confine the heat.

The ſteam is conveyed in horizontal pipes, carried along the ceiling of the dye-houſe, from which deſcend vertical tubes of from $\frac{3}{4}$ of an inch to $2\frac{1}{2}$ inches diameter, according to the ſize of the copper they belong to. Theſe ſteam tubes all paſs down on the outſide of their coppers, and enter them horizontally at the level of their bottoms; and are furniſhed with braſs cocks for regulating the admiſſion of the ſteam, or entirely interrupting it when the copper is not wanted.

The rapidity with which theſe coppers are heated, is truly aſtoniſhing. One of the largeſt in Mr. Gott's dye-houſe of 1800 gallons capacity, according to count Rumford, was brought to the boiling point in half an hour. The ſaving of fuel, though in general over-rated, is another advantage gained by this mode of applying heat. Mr. Gott ſtates this at two-thirds of the quantity conſumed when the coppers are heated by ſeparate fire-places; but this is evidently too much. The ſaving conſiſts in the application of fire to one veſſel only of large dimenſions, inſtead of to a number of ſmall ones; and though this is certainly accompliſhed with leſs expence of fuel, yet, if the fire has been well and properly applied in the latter caſe, the ſaving will amount nearer to one-third than to two.

The burning of the copper ſides and bottoms, when heated by a naked fire, is a heavy expence in a large eſtabliſhment, and often a ſource of ſerious inconvenience. By the application of ſteam, this is entirely done away, and even copper veſſels themſelves, for many operations, rendered wholly unneceſſary. Wooden veſſels have been ſubſtituted, with great advantage, in their ſtead, and when the uſe of copper cannot be diſpenſed with, it may be employed in thin ſheets, ſupported by a frame work of brick or wood. Important as theſe advantages are in an economical point of view, the ſyſtem of ſteam-heating has, if poſſible, ſtill more powerful recommendations. The eaſe, elegance, and regularity, with which the heat can be tranſmitted by a ſteam tube, are of themſelves ſufficient to entitle it to decided preference.

By the adjuſtment of the ſteam-cock, the rate of heating is ſo regulated, that the copper may be brought to the boiling point in any given time, with an exactneſs as well as celerity, unattainable by the other mode. The heat may in an inſtant be withdrawn, or rendered ſtationary at any fixed point, by a ſingle turn of the cock, the firſt of which is impracticable, and the latter extremely difficult, when the coppers are heated by ſeparate fire-places. The ſides and bottom of a dyeing copper, expoſed to a ſtrong and naked fire, are always much hotter than the dye-liquor, and occaſion copper-marks and unevenneſs in the goods, in ſome caſes difficult to avoid. This inconvenience is entirely removed by the uſe of ſteam, ſince the dyeing-veſſel deriving all its heat from the heated liquor within it, can never, it is evident, acquire a higher temperature.

The ſucceſs of Mr. Gott's experiments was ſuch, that many of his neighbours, at firſt much prejudiced againſt it, immediately adopted the plan. With a liberality worthy of imitation, his dye-houſe was open to all inquirers; and ſuch was the intereſt excited by this new and extraordinary mode of applying heat, that experiments were immediately inſtituted in different parts of the country, with a view of extending this improvement to other branches of the art of dyeing. Mr. Gott had proved and eſtabliſhed the practice as far as the dyeing of woollen goods was concerned, and little more remained to be done; in its application to calico-printing and the dyeing of lighter goods, however, difficulties occurred, of ſuch a nature, as wholly to diſcourage many whoſe trials were made in a haſty ill-concerted manner, and conſiderably to embarraſs thoſe whoſe experiments were conducted with greater ſkill and patience.

The great, and only well-founded, objection aroſe from the agitation into which the water was thrown when it approached the boiling point, by which the goods were entangled and faſtened, much more than in the ordinary mode. This inconvenience was not felt in Mr. Gott's dye-houſe, where the goods being woollen, and of much greater weight and ſubſtance, were leſs liable to be toſſed about by the aſcending currents from the ſteam-tubes than the thin and lighter goods manufactured from cotton. The evil was often increaſed by want of ſufficient attention to the regulation of the ſteam-cock; thrice the quantity of ſteam neceſſary to maintain the copper at the boiling point being admitted, which, retaining its elaſtic form at that temperature, paſſed through the copper uncondenſed, and threw the goods into the greateſt confuſion.

To diminiſh the agitation, it has been found neceſſary to break the force of the current, by introducing the ſteam in ſmall quantities, through two or three different openings, or in ſome caſes by introducing a falſe bottom, pierced full of holes, between the goods and the end of the ſteam-tube; by this means, and ſtill more by carefully admitting only the neceſſary quantity of ſteam, the agitation may be ſo far reduced, as to be no longer troubleſome.

The accumulation of condenſed water in the dye-copper, is a neceſſary conſequence of this mode of applying ſteam, and cannot be avoided. Where it is an object to diminiſh this as much as poſſible, it may be accompliſhed by uſing ſtrong, or which is the ſame thing, very hot ſteam; but it does not appear that any great inconvenience reſults from this trifling increaſe, which ceaſes when the copper has attained the boiling point, due allowance being made for it in the firſt inſtance, when the veſſel is filled with cold water.

When ſtrong ſteam is rapidly thrown into a veſſel filled with cold water, the condenſation is inſtantaneous, and attended with a loud noiſe, and violent ſhock.

We have ſeen a ſtone ciſtern of large dimenſions, and firm joinings, nearly ſhaken to pieces by the incautious admiſſion of ſteam, and many of the early experimenters complained that their coppers were nearly knocked to pieces, and that few would hold water after being heated once or twice.

This inconvenience may be corrected by ſtopping the end of the ſteam tube, and piercing the ſides full of ſmall holes, or, which is ſtill better, by turning up the end of the pipe, and fixing a valve in it. In either caſe the ſteam is emitted through the openings in ſtreamlets, or ſheets of ſmall volume, whoſe condenſation is attended with trifling noiſe, and little agitation of the veſſel. Several dye-houſes in Lancaſhire and Cheſhire have been fitted up on theſe principles, and, the coppers, thus heated, are uſed, with few exceptions, for every purpoſe of calico-printing.

Mr. Gott, as we have before ſtated, was the firſt who introduced this improvement on a large ſcale, the idea of which, count Rumford informs us, was derived from the peruſal of his ſeventh Eſſay. We know not what ſhare the count's publication might have in deciding the trial, but the idea of heating water by ſteam had occurred long before that time to Mr. Watt; and, if we miſtake not, a warm bath at Soho had been heated in this way, and ſeen by Mr. Gott, and many others, to whom the idea of its application to more uſeful purpoſes had naturally occurred.

For ſome few purpoſes we believe this mode of applying heat, by throwing ſteam directly into the dye-copper, is leſs advantageous. When goods, for example, are kept a long time at a low heat and never boiled, the accumulation of condenſed water, in this caſe, continues to the end of the operation, and weakens conſiderably the effect of the dye. All the advantages of this mode may, however, be obtained without any of the inconveniences we have before alluded to, by ſurrounding the dyeing-veſſel with a caſing of caſt iron, and throwing the ſteam in between this and the copper. The heat in this caſe is tranſmitted through the ſides of the copper, as in the ordinary mode of heating by a naked fire, and the condenſed water is carried off from the caſing either by a reverſed ſyphon, eight or nine feet long, or, when the ſituation will not admit of this, by a floating valve. In this way the noiſe and ſhock, from the rapid condenſation of ſteam in cold water, the agitation in the dye-copper, and the condenſed water, are all completely got rid of. The apparatus is, however, leſs ſimple and much more expenſive than the former.

A ſtrong ſteam is neceſſary to produce the boiling heat in a dye-copper cooled by the continued expoſure of the goods on the winch, and the veſſel and joints muſt be ſound and ſtrong to ſupport this preſſure. Both modes have their advantages, and will, we have little doubt, in a few years entirely ſuperſede the ordinary mode of heating by ſeparate fire places.

COPPER *mark*, is a ſtain, diſcolouration, and unevenneſs in dyed goods, cauſed by contact with the ſides of a *hot* or *dirty* copper, during the operation of dyeing. In the ordinary mode of heating, as has been obſerved in the foregoing article, the bottom and ſides of a dyeing-veſſel, when expoſed to a ſtrong and naked fire, are much hotter than the dye-liquor. When this is the caſe, and the colours pale and delicate, ſimple contact with the hot copper is ſufficient to cauſe unevenneſs, either by affecting the hue by the exceſs of heat, or enabling the mordant to combine with an extra portion of colouring matter. This inconvenience is in general remedied by placing a baſket of wicker work within the copper, which prevents the goods from touching the ſides of the veſſel; it is ſtill more completely guarded againſt by heating the copper with ſteam, in the manner already deſcribed.

The ſides of a copper will often occaſion marks or ſtains when the veſſel has been negligently waſhed out, and eſpecially when it has not been uſed for ſome time. A dye-copper not in uſe ſhould always remain filled with clean water. It prevents the formation of a ruſt on its ſurface, which ſimple waſhing will not remove, and which acts as a mordant, and fixes the dye whenever it touches the cloth.

COPPER *Iſland*, in *Geography*, otherwiſe called MEDNOI *Oſtroff*, *i.e.* Mednoi iſland, lies in the ſea of Kamtſchatka, which ſeparates the two continents of Aſia and America. It takes its name from large maſſes of native copper found upon the beach; and as it lies full in ſight of Beering's iſle, it was eaſily and ſpeedily diſcovered by thoſe who ſucceeded Beering. Theſe two uninhabited ſpots, to which the ſea-otters and other marine animals were accuſtomed to reſort in great numbers, and which were firſt viſited in 1745, were for ſome time the only iſlands that were known, until a ſcarcity of land and ſea-animals, whoſe numbers were greatly diminiſhed by the Ruſſian hunters, occaſioned other expeditions. Beſides the native copper which is found on the coaſt of this iſland, the true right camphor-wood, and another ſort of wood, very white, ſoft, and ſweet-ſcented, are found among the floating bodies which the ſea caſts upon the ſhore. The copper lies on the ſhore in ſuch abundance, that many ſhips might be loaden with it; and an Indian trader might make a profitable voyage from thence to China, where this metal is in high demand. This copper is moſtly in a metallic or malleable ſtate, and many pieces of it ſeem as if they had been formerly in fuſion. The iſland is not high, but has many hillocks, each of which has the appearance of having formerly been the funnel of a volcano. This iſland, as well as the others in its vicinity, are ſubject to frequent and violent earthquakes, and abound in ſulphur. (Coxe's Ruſſian Diſcoveries.) From the account in captain Cook's Third Voyage (vol. iii. p. 347.) we learn, that, on Mednoi and Beering's iſland, ſcarcely a ſea-otter is now to be found; though it appears from Muller, that in his time they were exceedingly plentiful.

COPPER-*Plates for Engraving*. We are favoured with the following account of the method of preparing copper-plates, as practiſed at preſent in London, by Mr. Harris, ſon-in-law and ſucceſſor to Mr. Whittow of Shoe-lane.

A ſheet of copper muſt be choſen as free as poſſible from flaws, and of a ſomewhat greater thickneſs than the finiſhed plate is intended to be: it is then to be ſcraped all over with a *ſcraper*, in ſhape ſomething like the head of a ſpear, and fixed in a handle long enough to go under the arm, the other hand holding the tool near the cutting part. When it has been perfectly freed from the outward cruſt, ſcales, or ruſt, it muſt be carefully examined to ſee if there are any holes or flaws in it; if there are (which is almoſt always the caſe), they muſt be ſcooped out by a tool called a *ſcooper*. This being done, it is next to be well and regularly hammered all over on an anvil, of a conſiderable degree of convexity, in order to harden it; and afterwards on a broad and nearly flat anvil, to flatten and planiſh it. After this has been performed, it is to be cut to the ſize wanted, and the edges a little chamfered or bevilled, and is now to be ſtoned, that is, rubbed all over with a faſt cutting, but not very coarſe, grit ſtone, care being taken to uſe a great quantity of water, to float off the particles mutually abraded from the copper and ſtone. When it is judged that all the marks of the ſcooper

and

nad hammer are rubbed out, a ſtone of a fine grit is to be uſed in the ſame manner, and after this a third.

The two firſt-mentioned ſtones are ſold at the ironmongers in London, under the name of "Carpenters' ſtone;" the beſt kind are brought principally from the coal fields in the neighbourhood of Bilſton in Staffordſhire. The ſtone laſt uſed is called "Water of Aye ſtone," and brought from Dumfriesſhire. All the three kinds contain a conſiderable quantity of argil in their compoſition. Lately, a very fine grained argillaceous grit, brought from the neighbourhood of Sheffield, has been uſed inſtead of the Bilſton ſtone.

After the operation of ſtoning has been performed, the plate is to be "coaled." This is done by rubbing it firſt with charcoal of birch-wood, or alder, and water, and then with charcoal of willow: the latter gives the finer poliſh, particularly if oil inſtead of water be uſed. Sometimes the plates are finiſhed by burniſhing, but this is not now often done.

The charcoal is not prepared by the copper-plate makers, but is procured from the dealers in that article by the workmen, who take a plate of copper, and by trial diſcover which pieces are fit for their purpoſe.

COPPER-*Plate Printing.* See *Rolling-preſs* PRINTING.

COPPER-*Plate Work*, in *Calico-Printing.* The application of engraving has given birth to a new and important branch of calico-printing. It firſt introduced thoſe machines whoſe ſubſequent improvement has ſo much contributed to the perfection of the art, and which ſurpaſs the ordinary mode of block-printing, not only in neatneſs, accuracy, and preciſion, but ſtill more in the economy and activity with which the labour is performed.

Theſe machines are of two kinds, the flat preſs, and the rolling or cylinder preſs.

The flat preſs, in its original form, was merely a modification, conſiderably enlarged, of the preſs for ornamental prints or engravings; to which was added a contrivance for *joining*, with accuracy, the numerous and ſucceſſive impreſſions neceſſary to cover a piece of cloth. It was confined at firſt to one colour, but later improvements have extended it to two and even three. The ſingle colour preſſes are, however, principally in uſe.

The cylinder, or rolling-preſs, is of later invention, and differs from the former chiefly in the ſubſtitution of an engraved cylinder for a flat plate. With the latter the cloth is printed by *ſucceſſive* impreſſions, in which the accuracy of the joining is of great importance: in the rolling-preſs, the revolution of the engraved cylinder forms one *continued* impreſſion, from one end of the piece to the other, in which there are conſequently no joinings. This is a great advantage, eſpecially in ſmall and delicate patterns, where a variation of a hair's breadth in the joint is readily perceived; but its great ſuperiority over the flat preſs conſiſts in the economy of time and labour. With a well-conſtructed cylinder-preſs, and proper arrangements for accelerating the work, one man and a boy will print 200 pieces, of 28 yards each, in the ſame time that a flat preſs man will print 12 pieces, or a block printer 8; that is, in one day. They are conſtructed to work one, two, and even three colours, but are generally confined to one; the difficulty and delay in adjuſting the ſeveral cylinders to each other, when more than one colour is worked, counteracting, in great meaſure, the chief advantage of the machine. For a deſcription of theſe preſſes, and the mode of working them, ſee PRESS. See alſo the article ENGRAVING.

COPPERAS, a term employed popularly and by the old chemiſts as ſynonymous with vitriol. Of Copperas there are three kinds, the *Green* or Sulphat of IRON, the *Blue* or Sulphat of COPPER, and the *White* or Sulphat of ZINC, which ſee.

The former is diſtinguiſhed in common by a variety of names, as Martial vitriol and Roman vitriol, but moſt commonly by the names of green copperas or green vitriol. It is ſeldom made by the direct combination of ſulphuric acid with the oxyd of iron, which conſtitutes this ſubſtance, except for the purpoſes of experiment in the laboratory of the chemiſt. The common, as well as the refined, is manufactured on the large ſcale, as an article of commerce, in the neighbourhood of collieries, and is in ſome inſtances found native. It was known to the ancients, as Pliny informs us, (N. H. l. xxiv. c. 12.) and denominated by them Miſy, Sory, or Calcanthum. Concentrated ſulphuric acid has ſcarcely any action on iron; when it is heated the acid is decompoſed, part of its oxygen combines with the iron and ſulphurous acid gas is evolved, but when diluted ſulphuric acid is added to iron filings, a violent efferveſcence takes place, and hydrogen gas is diſengaged; in this proceſs the water, with which the acid is diluted, is decompoſed, the oxygen of which combines with the iron; and converts it into an oxyde; whilſt the hydrogen eſcapes in the form of gas, the ſolution is of a green colour, and by evaporation affords cryſtals of ſulphat of iron which are tranſparent, of a fine green colour, in the form of rhomboidal priſms, having an acrid aſtringent taſte; this ſalt almoſt always reddens vegetable blues, is very ſoluble; two parts of cold water, or leſs than its weight of boiling water, being ſufficient for its ſolution.

The mode of preparing it, as an article of commerce, is purſued principally, as before obſerved, in the neighbourhood of coal pits, in many of which a ſubſtance is found in great abundance, which, though injurious to the coal, forms nevertheleſs a valuable material as being the baſis of copperas, known by the name of pyrites or braſſes; theſe are carefully ſeparated from the coal, and the expence which this labour occaſions, is amply repaid by the produce of the manufacture; the proceſs is at once ſimple and economical, and does honour to the intelligence of thoſe who firſt ſuggeſted it. A large area of ground is incloſed, to which a gentle but ſenſible declivity is given; the ſurface is made quite equal, and covered with an unctuous clay, which is every way extended and ſmoothed, as if plaiſtered, in order to prevent the water from filtrating into the earth; at the ſame time a furrow is formed in the midſt of the area, for collecting all the water in one point, and conveying it to a reſervoir; the area being thus prepared, the pyrites are ſpread all over its ſurface, in layers one above another to the height of ſeveral feet; care is taken in placing the different pieces to leave intervals for the admiſſion of the air: now as theſe pyrites contain iron in combination with ſulphur, when they are expoſed to the alternate action of water and the atmoſphere; they undergo a material change, the water is decompoſed, one of its conſtituent parts, namely, the oxygen, combines with the ſulphur, and forms ſulphuric acid, or oil of vitriol; the hydrogen eſcapes into the atmoſphere, by this means a ſaline powdery maſs is formed, the taſte of which is auſtere and ſtyptic; the decompoſition is materially aſſiſted by occaſionally turning the pyrites with rakes having long iron teeth, like thoſe uſed in Glaſgow and neighbouring places, for ſtirring the boiling ingredients of the glue maker, by which means new ſurfaces are preſented to the action of the atmoſphere. In ſummer, when it is long dry weather, it is neceſſary to ſprinkle the braſſes frequently with water, to waſh away the ſalt which is already formed, and alſo to produce that humid warmth which accelerates ſtill further the decompoſition; gentle ſhowers are therefore excellent for bringing forward this part of the operation. The water loaded with vitriol, finding a clay bottom, which prevents its loſing itſelf in the earth, flows down the inclined plane, and falls into the reſervoir, in which a quantity of old iron is placed, purchaſed principally from the ſmiths and the coopers, as their refuſe. It is well known that, during the decompoſition of the pyrites, more ſulphuric acid is produced, than the iron contained in them will neutralize; the refuſe iron is therefore placed in the reſervoir and the liquor run upon it, in order to combine with the ſuperabundant acid. The natural evaporation which takes place here adds to its ſtrength, and, when it is conceived to be properly prepared, it is drawn off into a ſecond reſervoir, attached to the workhouſes of the manufactory; from thence it paſſes into leaden boilers, where it is made to boil and evaporate by a large fire, formed of the moſt inferior kind of coal; when the liquor is brought to a proper ſtate, it is run out by ſyphons, or drawn out by pumps, into long wooden troughs, where it is cryſtallized by the operation of cold, the cryſtals attaching themſelves to twigs and branches of trees, which are ſuſpended in the troughs for the purpoſe by being hung over pieces of wood, ſeveral of which are laid acroſs the top of each trough; from theſe branches they are taken and dried, and are then ready for the market.

Refined Copperas is an improvement in the mode of preparing copperas, and was diſcovered by the late Mr. Thomas Barnes, of Walker, near Newcaſtle-upon-Tyne, a coal viewer of the firſt eminence in that neighbourhood; this is effected by merely evaporating ſtill further than in the common mode the water of cryſtallization, and attending throughout the whole proceſs to a little more cleanlineſs and exactneſs in the manipulations.

Two or three men are ſufficient to manage a manufactory of either kind, and to produce a great quantity of the articles; conſidering which, and the rate it ſells at, at preſent (1806) from 10 to 14*l.* *per* ton, it ranks with the moſt beneficial manufactories.

Amongſt the few places in which this ſalt is found native, we ſhall only notice that at Hurlet near Paiſley, in a ſtratum of ſchiſtus, ſunk through in 1786 to a ſeam of coal, pyrites abound ſo much, that native copperas is ſometimes found; it does not in this inſtance lie in any regular bed, but is interſperſed through the ſtratum, and ſeparated from the coal by the workmen. Theſe works were eſtabliſhed in 1753 by a company of gentlemen from Liverpool, for the ſole purpoſe of making alum, but finding both pyrites and native copperas, they added the manufacture of that article alſo.

COPPERAS *ſtone*. See PYRITES.

COPPER-*Mine*, in *Geography*, a large river in the central parts of N. America, reckoned to be the moſt northern in the American continent. Purſuing a northern courſe, it falls into the ſea in N. lat. 72°, and W. long. 120°, according to Mr. Hearne, and 113° according to the poſition aſſigned it by Mr. Arrowſmith. In 1771 Mr. Hearne arrived at this river, who found that it flows into the Arctic ocean, or rather, as he intimates in the preface to his book, publiſhed in 1795, into an inland ſea like that of Hudſon. From his journies, performed in 1769—1772, we may infer, with a great degree of confidence, that the ſearch after a N. W. paſſage is not likely to ſucceed. Upon his arrival at the copper river, on the 14th of July 1771, the ſavages who attended him murdered, in a ſhocking manner, ſome Iſkimo families. On the 17th he was within ſight of the ſea; and commencing his ſurvey, purſued it to the mouth of the river, which he found ſo full of ſhoals and falls, that it was not navigable even for a boat, and that it emptied itſelf into the ſea over a ridge or bar. As the tide was out, he perceived by marks on the edge of the ice, that it flowed about 12 or 14 feet, and of courſe could reach but a little way within the river's mouth, and he found the water perfectly freſh. He concluded that this river ran into the ſea, or ſome branch of it, by the quantity of whalebone and ſeal-ſkins which the Iſkimos, (or Eſquimaux) had at their huts, and alſo by the number of ſeals which he ſaw on the ice. It has been ſuggeſted that, as he did not taſte the water, which ſeems ſomewhat ſurpriſing, this ſea, or branch of it, as he conceived it to be, might have been a freſh water lake. Seals, it is obſerved, are not uncommon in the ſea of Baikal; and the whalebone might have been procured in barter. The ſuppoſed tide is not unknown on occaſion of high winds in the ſouthern lakes. However this be, Mr. Hearne ſays, that he had an extenſive view of the ſea, and that, from the mouth of the river, it was full of iſlands and ſhoals, as far as he could ſee with the aſſiſtance of a good pocket teleſcope. The ice was not then broken up, but was thawed for about ¾ of a mile from the main ſhore, and to a little diſtance round the iſlands and ſhoals. The Iſkimos here were of a dirty copper colour, and rather ſhorter in ſtature than thoſe to the ſouth. Their kettles were made of lapis ollaris, of a mixed brown and white; and their hatchets and knives were of copper. The dogs have ſharp erect ears, ſharp noſes, and buſhy tails, being a fine breed of that ſort. Many kinds of ſea-fowl were obſerved: and in the ponds and marſhes ſwans, geeſe, curlews, and plovers. The quadrupeds are muſk cattle, rein-deer, bears, wolves, wolvereens, foxes, Alpine hares, ſquirrels, ermins, mice. Mr. Hearne, in the proſecution of his ſurvey, viſited one of the copper mines, about 30 miles S.E. from the mouth of the river, which was merely a hill that ſeemed to have been rent by an earthquake, or perhaps by ſubterraneous water. The copper is found in lumps, and is beaten out by the help of fire and two ſtones.

COPPER-*Mine hills*, hills of N. America, in N. lat. 68° 30′. W. long. 112°.

COPPET, a ſmall town of the Pays de Vaud, in Switzerland, delightfully ſituated on the banks of the lake of Geneva, 12 miles N. of Geneva. It is an ancient Swiſs barony, compriſing eight villages beſides the town; its territory produces excellent red wine. The caſtle which commands the lake ſuſtained an obſtinate ſiege in 1536 againſt the troops of Berne, who at laſt reduced it to aſhes. In the year 1657, the barony of Coppet was bought by Frederick, count of Dohna. He rebuilt the caſtle in a modern ſtyle, but his ſon ſold the eſtate to an inhabitant of St. Gall, from whoſe deſcendants it was purchaſed ſome time before the French revolution by the celebrated Necker, who expended large ſums in embelliſhing a ſeat, the ſituation of which is truly enchanting, and where he cloſed his chequered career. He left it to his daughter, the baroneſs of Stahl Holſtein, whoſe name is dear to French literature, and who was baniſhed to this eſtate in 1807, for having produced the intereſting novel of Corinna. *Durand.* Statiſtique Elementaire de la Suiſſe 1795.

COPPI, JACOPO, in *Biography*, conſidered by Lanzi the ſame perſon with *Jacopo del Meglio*, was born in the Florentine ſtate in 1523, and was employed, in concurrence with the other expert manneriſts of his ſchool, in the large altar pictures of the church of Santa Croce at Florence. If, however, we may judge from the critiques of Borghini and other writers, his merit upon this occaſion appeared leſs conſpicuous than in ſome ſmall pictures of fabulous ſubjects, which formed part of the ornament of an eſcrutoire executed, under the inſpection of Vaſari, the chief of the Florentine ſchool of that period, for the prince Franceſco de Medici: but his maſterpiece is a picture repreſenting the crucifixion in the church of St. Salvatore at Bologna, which, according to Lanzi, is nowiſe inferior to the fineſt works of Vaſari himſelf, and may indeed rank with the beſt productions of the Bologneſe artiſts prior to the Caracci. It is dated 1579. The artiſt died in 1591. Lanzi, Storia Pittorica.

COPPICE, in *Rural Economy*, a low ſort of incloſed wood, which is cut over at ſtated periods, for different purpoſes.

Theſe ſorts of woods, wherever there is much demand for the various ſmall ſtuff which they are capable of affording, yield conſiderable returns to their owners; particularly where proper care is taken in fencing and preſerving them againſt live ſtock.

In caſes where new coppices are to be raiſed, it is neceſſary to beſtow great attention on the nature of the ſoil, and the expoſure of the land; adapting the trees and plants to the nature of theſe, as much as poſſible; and at the ſame time, taking into conſideration the ſorts that are the moſt uſeful, and moſt in requeſt in the particular diſtrict or vicinity: as this ſort of wood is in general diſpoſed of to the greateſt profit and advantage, where there is little trouble of carriage. The ground ſhould be well drained, where it is inclined to be wet, and alſo well incloſed from the cropping of cattle. Some likewiſe adviſe, that where it is covered with buſhes or briars, that they ſhould remain to ſhelter the young growth of wood; and that if there happen to be a moderate quantity of young oak and aſh-trees on the ſpot, to let them ſtand by all means: always keeping in mind how neceſſary ſhelter is for the growth of wood of all kinds and ſorts. But that in newly planted coppice-woods, where all the plants are of the ſame age, there is not the ſame reaſon for letting them ſtand before they are ſtooled off for underwood, as for young trees planted to fill up old woods. Thoſe which are intended for underwood may, in ſuch newly planted woods, be cut off when planted, or at any age from eight to fourteen years, without injury. Indeed, young woods ſhould not ſtand too long previous to the firſt cutting. It is obſerved in the ſeventh volume of the Letters and Papers of the Bath Society, that the kinds of wood to be planted in coppices, either in making new ones, or filling up old ones, ſhould be regulated partly by the demands of the country, but chiefly by the peculiar aptitude of the ſoil and ſituation to produce particular ſorts. Let nature be the guide, ſays the writer, in planting, and you will ſeldom do wrong. Particular ſoils and particular ſituations will always favour particular kinds of trees: we need not look for the reaſon, but only for the fact.

The chalk hills of Hampſhire are peculiarly proper for beech; the flinty loams and clays of the ſame county, for oak and aſh; the moſſy ſteep ſides of the Wiltſhire downs, for hazel; and the ſands of the ſame diſtrict, for aſh; the rugged and almoſt naked rocks of Mendip, in Somerſetſhire, produce the lime tree and the walnut in the greateſt luxuriance; and on the higheſt parts of the ſame Mendip hills, where no other tree can ſtand the ſea-breeze, ſycamore flouriſhes as well as in the moſt fertile valley. Taking the general demand of counties, and the peculiarities of different ſoils, into conſideration, it is aſſerted that there is no kind of wood ſo generally proper for planting in coppices as aſh: the value of aſh-poles being at leaſt one-third more, and frequently as much again, *per* hundred, as that of other poles, as being applicable in all ſizes to ſome uſeful purpoſe or other; the timber being always in requeſt, and ſaleable at any age or ſize, at almoſt the price of oak; and the wood itſelf being as quick a grower as any, and quicker than moſt; and, above all, there being but few ſoils, from the blackeſt and wetteſt bogs to the higheſt and moſt expoſed mountains, where it will not grow, are reaſons why aſh is one of the moſt profitable woods to plant in ſuch coppices as are favourable to its growth. In ſoils and ſituations where aſh does not grow kindly, let ſuch other ſorts of wood be planted as appear to thrive beſt in ſimilar ſoils and ſituations in the ſame county. Spaniſh cheſnut, though not ſo general a grower as aſh, is a moſt excellent wood, either for timber or underwood, and wants only to be more known to be higher in eſtimation. It partakes much of the properties of oak, but excels it in two points, namely, that it grows faſter, and that the ſap part of the timber is firmer and leſs corruptible. To fill up woods that are become thin by age or neglect, the proper time is one year, or at the utmoſt two years, after the underwood is cut. The young plants ſhould be eight or ten feet high, and an inch and an half diameter at the ground, and ſhould be planted without cutting off. If the ſoil be dry, no other preparation is neceſſary than barely digging the holes for the plants; if wet, deep drains ſhould be made, to take off the ſuperabundant water. The earth dug from theſe drains ſhould be thrown out on the lower ſide of them, and upon this new earth the plants ſhould be planted. If land of this latter deſcription be black and peaty, aſh is peculiarly proper for it; and will, if planted on the earth thrown from the drains, make a moſt ſurpriſing progreſs. If it be a ſtiff yellow clay, it is generally more favourable to the growth of oak than of aſh. In ſuch ſoils, oak for timber, with a mixture of willow, birch, alder, and Spaniſh cheſnut, for underwood, will perhaps be the moſt proper. All theſe kinds ſhould ſtand one round of the underwood; and if ſtill weak, ſhould ſtand two, before thoſe are cut off which are intended for underwood. Birch plants are indeed an exception to this rule: they ſhould always be cut off the firſt round of the underwood; for, if they are large when cut off, the ſtocks frequently decay and die. In all mixtures of kinds of wood for coppices, thoſe ſorts ſhould be uſed which are not unfriendly to each other, and which will come round fit to be cut together at the ſame periods; and ſuch kinds ſhould be allowed to ſtand for timber, and that at ſuch diſtances as to injure the underwood as little as poſſible. The plants for filling up old decayed woods of the coppice kind, ſhould be the ſtrongeſt and beſt of their kinds. Thoſe which are weak at firſt will be drawn up by the ſurrounding underwood, and become, from their increaſed height, ſtill weaker. At the next cutting of the underwood, they will be blown down; or, if cut off, the ſhoots will be too weak to grow up with the other underwood. Oak, aſh, and Spaniſh cheſnut, ſhould be kept in a nurſery for this purpoſe. Alder and birch plants grow plentifully ſpontaneouſly in ſome countries, and may be taken up for uſe; if none ſuch are to be obtained, they may be raiſed from ſeed ſoon on a moderate hot-bed, in the open air. Alder is ſometimes propagated by taking up old roots, and dividing them into ſeveral parts; and hazel may be propagated the ſame way. Willow is generally planted in cuttings; but a much better way, where there are any old willow ſtocks, is to plaſh down the ſhoots, and fill up the vacant places round ſuch old ſtocks. The wild cherry, which will grow on almoſt any ſoil, and is eaſily propagated, makes an exceedingly good underwood, though as yet it is but ſeldom uſed for that purpoſe.

It is remarked by the author of Modern Agriculture, that the coppice-woods, when the ſhoots are young, whether of oak, aſh, elm, or birch, or a mixture of theſe with other ſorts, are very little attended to in any part of the iſland; fencing being the only particular which marks the difference between a good and a bad manager. But, he ſays, when the wood can be ſold for different uſeful purpoſes, at various ſtages of its growth, as is the caſe in many parts, an eſſential improvement in the management of coppices might be introduced with great propriety. In all ſuch ſituations, it would be profitable to the owners, were the ſhoots thinned two or three times between each general cutting. The weedings or thinnings would do much more than defray the expence, while, by admitting a more free circulation of air, and by cutting off the ſupernumeraries, the principal ſhoots would advance more rapidly, and become by that means fit for ſale, perhaps, two or three years ſooner than they do by being allowed to remain in a neglected ſtate. This is a circumſtance that particularly merits the attention of thoſe who are favourably ſituated, in regard to market, for the various productions of coppices; as ſaving two or three years in the regular cuttings would materially enhance the value of the land ſo occupied.

He further ſtates, that ſeveral other improvements in the management of coppices might certainly be effected, were the owners to beſtow due attention. It frequently happens, that, from miſmanagement in cutting, many of the ſtools become uſeleſs, while ſcraggy thorns, brambles, &c, are allowed to ſpring up, and occupy the place of more valuable plants. Were the owners of coppices in general to permit their labourers, or other induſtrious poor people in the neighbourhood, to dig up the decayed ſtools and uſeleſs bruſhwood for fuel, under condition that they plant healthy vigorous ſtools in their places, the coppices by this management would neceſſarily become more valuable. Much damage alſo frequently happens from allowing the underwood to remain ſcattered over the ſurface of the wood, for a conſiderable time after it is cut. Every perſon muſt be ſenſible, that if the cuttings are allowed to remain in this ſituation till after the young ſhoots begin to ſpring, it is ſcarcely poſſible to remove them without breaking or otherwiſe injuring theſe tender ſprigs. In all auctions of coppices, it ought, therefore, to be an article of ſale, that the whole ſhould be carried off the premiſes in a limited time; and the foreſter, or wood-officer, ſhould receive injunctions to ſee this condition of the ſale ſtrictly fulfilled.

Much greater care is requiſite, the ſame writer ſays, in cutting coppices properly than the owners, in many caſes, are diſpoſed to beſtow. It cannot be ſuppoſed, when fifty or a hundred purchaſers, with their aſſiſtants, are allowed to uſe their axes with no other view than to cut the wood which they have purchaſed, without regard to the ſucceſs of what may be called the next or following crops, that any regard will be beſtowed as to the proper manner of cutting. It is certainly of much importance, not only for the future vigour, but alſo for the durability of the ſtools, that the ſtems or ſhoots ſhould be cut in that manner which experience has proved moſt effectual for anſwering both purpoſes. The ſhoots ought to be cut as low as poſſible, without injuring the ſtools. When that practice is adopted, the ſtools remain nearly even with the ground, and conſequently in a much better ſtate of preſervation than by cutting the ſtems at the height of ſix, eight, or ten inches; as, by this method of cutting being frequently repeated, the ſtools get in proceſs of time, as he has frequently ſeen, to the height of ſeveral feet above the ſurface ſoil. Another common error, and which wood-cutters of the above deſcription may be ſuppoſed very guilty of, is to leave the butt ends of the ſtems jagged and uneven, and part of the bark torn off, or looſened all the way down to the ſtool, than which nothing can be more injurious. The butt-ends of the ſtems ought rather to be brought to a point in the middle, and the bark remain quite cloſe and firm, otherwiſe dews and rain drop into the hollows, and either rot or otherwiſe prove ruinous to the future health and vigour of the ſtools. In ſhort, to render a coppice both valuable and laſting, a larger ſyſtem of management ought to be adopted. For the reaſons mentioned above, they ought to be thinned two or three times between every general cutting. The uſeleſs bruſh-wood ought to be rooted out, and other more uſeful plants ſubſtituted. Where too much water abounds, drains ought to be opened; the fences at all times kept in a ſubſtantial ſtate of repair; and on no conſideration whatever ſhould the purchaſers of coppices be allowed to cut down the woods. Men employed by the owners, and who are properly bred to the buſineſs, ought only to be employed; who, by beſtowing proper pains in dreſſing and pruning the butts and ſtools as they go along, would thereby enſure the ſpringing of numerous and vigorous ſhoots the following ſeaſon.

The periods of cutting coppice underwood muſt be regulated, it is obſerved in the work firſt mentioned, by the luxuriance of its growth, and by the demand of the country, and the uſes to which the wood is to be applied when cut: but, in general, the common rule of trade will hold good here, *viz.* "that ſmall gains and quick returns make the dealer rich, but long credit ruins." In the article of underwood, not only the intereſt of money, but the loſs of the ſucceeding growth, tells againſt the value of ſtanding wood after it is fit to cut, and makes it doubly the advantage of the owner to cut his underwood as early as it is ſaleable. As ſoon, therefore, as any kind of wood is fit for the uſes of the country, it ſhould then be cut; unleſs it can be made appear, that it will pay compound intereſt for ſtanding longer, or, in other words, will pay not only the ſimple intereſt of the firſt value, but alſo the loſs of ſo many years growth of the wood, as ſo far advanced towards another crop. Wood merely for fuel can ſcarcely be cut too young. Hazel is uſually fit for hurdles and dead hedges, from nine to twelve years old; aſh for ſheep-cribs, at the ſame age; and aſh and other woods for hop-poles, from eleven to fourteen years old: while aſh for carpenters, and other large uſes; alder, birch, and willow, for rafters, turner's uſes, pattens, clogs, coal-pit uſes, &c. muſt ſtand from ſixteen to twenty years, before the poles are large enough for their reſpective purpoſes. It therefore behoves every owner of woods of the latter deſcription, unleſs he is public-ſpirited enough to give up his own profit to the good of the public, to conſider well before he ſuffers his wood to ſtand to the age of ſixteen, eighteen, or twenty years, whether the value of ſuch wood, when cut younger, and ſold for other purpoſes, added to the intereſt thereof up to the uſual period of cutting, and the gain by the growth between theſe two periods, will not more than equal the value the wood will be of, if ſuffered to ſtand ſo long; and if ſo, whether he ought not to cut his wood at ſhorter periods. He will have this additional ſatisfaction, that, by more frequent cuttings, his wood will be the leſs liable to decay, by the ſtrong ſhoots ſmothering the weak ones, as is before explained; and will have an opportunity of letting up more ſaplings for timber than he could otherwiſe do. There are many opinions reſpecting the moſt proper time of the year for cutting underwood; but there is one rule which, on the ſeller's part, is without exception, *viz.* that the older the wood is, the later in the ſpring it ſhould be cut. When old wood is cut early in the winter, and a hard winter follows, the damage done to the ſtocks is very great: young flouriſhing wood will bear cutting at any time. But on the part of the buyer, it is allowed that all woods are more durable, when cut in the moſt ſtagnant ſtate of the ſap; and in all caſes where bending is required, ſuch as hurdles, hoops, and even dead hedges, the wood cannot be cut too early in the winter, being,

ing, if cut when the ſap is riſing, brittle, and unfit for thoſe purpoſes. Oak underwood will, at the preſent price of bark, pay well for ſtanding till the ſap is up for barking it; and it ſeldom happens that the ſtocks are injured by cutting it ſo late in the year.

The beſt way of diſpoſing of coppice-underwood, to anſwer the purpoſe of the ſeller, is, in the opinion of this writer, to cut it at the ſeller's expence, before it is ſold; to lay it out in ranges or drifts, according to the cuſtom of the country; to value it in that ſtate, and ſell it in ſuch ſized lots as the number of buyers may warrant: always keeping up a ſufficient number to make a competition, and particularly to oblige the buyers to clear the whole out of the wood by the 24th day of June; and never to ſuffer them to bring their horſes into the woods, after any new ſhoots are ſhot out, without muzzling them, or at leaſt tying up their heads.

But in the View of Modern Huſbandry, Mr. Donaldſon thinks, that the more approved method of diſpoſing of coppice, or other under-ſized wood, is that which is practiſed in Northamptonſhire. When the ſeaſon for cutting arrives, which is during the winter months, or before the ſap begins to aſcend, that operation is performed by people employed by, and who work under the direction of, the owner of the woods or his agent. The part of the wood intended to be ſold, is parcelled out into regular ſized lots, to ſuit the convenience of the intended purchaſers. The whole of the underwood, growing upon each lot, is indiſcriminately cut, and laid in one direction. As ſoon as the operation of cutting is completed, and the wood parcelled out in a proper manner, a valuation is put on each lot or parcel according to its quality, and the whole is then ſold by public auction to ſuch perſons as incline to become purchaſers, who, over and above the price of the underwood, repay the expence of cutting. This is, however, by no means the general mode in which woods of this deſcription are cut. It is a very common, but a very bad, practice, to ſell the coppice under the condition that the purchaſers are to be at the expence of cutting it down. This is often performed in ſuch a careleſs manner, that the ſtools are ſo greatly injured, that they either rot or die, or a few weak ſtinted ſhoots only ſpring up.

The price of coppice or underwood varies ſo exceedingly, that it is almoſt impoſſible to form any idea of the value of the acre. Perhaps 8 or 9*l.* may not be far from the average price of coppices, not remarkably ſituated in regard to market, and when they are cut every twelve or fourteen years. But the value of coppices depends on many circumſtances; as the roots of wood, the uſes to which they are applied; the price of bark, &c. In ſome parts of Kent, where hop-poles are in great requeſt, an acre of coppice will yield ſometimes 30 or 40*l.* at a cutting. Whereas in Scotland, where the coppices are for the moſt part oak, and where the wood is chiefly uſed for fuel, or converted into charcoal, the value of the coppices conſiſts almoſt entirely in the quantity and quality of the bark, the wood being little more than ſufficient to defray the expence of cutting and peeling.

Mr. Marſhall, in his "Management of Landed Eſtates," has remarked, in reſpect to ſtub or coppice wood, that "the proper harveſting it as of timber, depends on ſituation and other circumſtances. And that the age or ſize of cutting muſt ever be guided by the demand in a given diſtrict; whether it be for the uſe of coal-mines, or for cord-wood, hop-poles, hoops, ſticks, faggot-wood, or other ware.

"The mode of diſpoſal is," ſays he, "to be determined upon by the ſucceeding crop. If the land be intended to be appropriated wholly to coppice wood, it is generally the moſt eligible to diſpoſe of the crop, as it ſtands, by auction or propoſal. But if ſeedling plants are to be ſet out for timber ſtands, or the young ſhoots from the ſtubs to be trained up, in the grove manner, it is requiſite that a proprietor ſhould employ his own people in reaping the crop, and making it up into ſuch wares as are the moſt ſaleable and profitable.

"In cutting down coppice-woods, the main obſervances are," he thinks, "to cut them in ſeaſon, to take off the ſtems, clean and ſmooth, with upward ſtrokes of the axe, that the ſtubs may ſhoot with the greater certainty; and to cut them off as low as conveniency will allow, in order that the ſhoots may be few and vigorous."

Coppice-*Wood*, is that ſort of ſmall woody growth, which is raiſed in incloſed woods of the coppice kind, and which is converted to various purpoſes of the farmer and manufacturer, ſuch as cord-wood, hop-poles, hoop-ſtuff, hedge-ſtuff, faggot-wood, and various other ware.

COPPLE-Stones, in *Natural Hiſtory*, globuli lapidei, rotulæ lapideæ, boulder-ſtones, rolled-ſtones, or pebbles, as ſome call them, are rounded and worn fragments of ſtones and rocks, that are not inveſted with an exterior ſtony cruſt or ſkin, occaſioned by concentric laminæ of the ſtone, but ſhew the internal plane laminæ broken off and rounded at their edges by attrition. It is of the utmoſt conſequence, in all reſearches relating to the ſtrata of the earth, to diſtinguiſh carefully between copple or boulder-ſtones, and original nodules of the ſtrata.

COPPY, in *Rural Economy*, is a term ſometimes provincially employed to ſignify a wood of the coppice kind. Thus to coppy, in ſome diſtricts, ſignifies to cut over for underwood.

COPRATAS, in *Ancient Geography*, a river of Aſia, in the Perſian territory, mentioned by Strabo and Diodorus Siculus; the latter of whom ſays, that it diſcharged itſelf into the Tigris.

COPRIA, a name given by Strabo to a ſhore of Sicily before Tauromenium, becauſe the wrecks of veſſels that were loſt in the gulf of Charybdis were collected in this place.

COPROCRITICA, from κοπρος, *excrement*, and κρινω, *ſeparate;* medicines which purge away the excrements in the guts.

COPROPHAGOS, from κοπρος, and φαγω, *I eat;* the *dung-fly*, in *Natural Hiſtory*, the name given by many authors to the common yellowiſh fly found on human excrements. There are ſeveral other ſpecies found on the excrements of various animals, and thence called *merdivoræ*.

COPROSMA, in *Botany*, (from κοπρος, *dung*, and οσμη, *ſmell*, alluding to the offenſive ſmell of the firſt ſpecies.) Forſt. Gen. 69. Linn. jun. Supp. 24. Schreb. 1593. Juſſ. 205. Lam. Ill. pl. 854. Claſs and order, *polygamia monœcia* (*pentandria digynia;* Linn. jun.) Nat. Ord. *Rubiaceæ*, Juſſ.

Gen. Ch. *Hermaphrodite flowers*. *Cal.* Perianth inferior, one-leafed, ſhort, five-toothed, permanent. *Cor.* monopetalous, bell-ſhaped, much larger than the calyx, five, ſix, or ſeven-cleft; ſegments acute, erect. *Stam.* Filaments five, ſix, or ſeven, capillary; anthers oblong, bifid at the baſe, erect, a little incurved, acuminate. *Piſt.* Germ ſuperior, oblong; ſtyles two, filiform, ſlightly cohering at the baſe, longer than the corolla, divaricated; ſtigma ſimple. *Peric.* Berry ovate-globular. *Seeds* two, flat on the inner.

ıner, and convex on the outer ſide, ſeparated from each other by the pulp of the berry. *Male flowers*, *Cal.*, *Cor.*, and *Stam.*, as in the hermaphrodite. *Piſt.* abortive.

Eſſ. Ch. Calyx one-leafed, five-toothed. Corolla five, ſix, or ſeven-cleft. Stamens five, ſix, or ſeven. Styles two, long. Berry with two ſeeds.

Sp. 1. C. *fœtidiſſima.* Forſt. Fl. Auſt. 138. Linn. jun. Supp. 178. Mart. 1. Lam. 2. "Flowers ſolitary." A very fœtid ſhrub. 2. C. *lucida.* Forſt. Fl. Auſt. 137. Linn. jun. Supp. 178. Mart. 2. Lam. 1. "Peduncles compound." A perfecty ſmooth ſhrub, reſembling phyllis in its habit. *Leaves* oppoſite, petioled, egg-ſhaped, acuminate upwards and downwards, quite entire. *Stipule* interfoliaceous, ſolitary, combining the leaves, acute. *Peduncles* axillary, ſolitary, oppoſite, two-leaved, terminated by heads of pedicelled flowers. Calyx and corolla greeniſh. Both the ſpecies are natives of New Zealand.

COPSE, in *Agriculture*, a term applied to the regulating iron apparatus, which is fixed to the end of the beam of a plough, and to which the team is attached. Theſe irons are of very different forms and conſtructions according to circumſtances.

COPTIS, in *Botany*, (from κοπτω, *ſcindo;* a name taken from the cut leaves of the plant.) Linn. Tranſ. vol. viii. p. 305. A genus formed by Mr. Saliſbury for Helleborus trifolius of Linnæus, which differs from the other hellebores, in having a caducous corolla. See Helleborus *trifolius*.

COPTIS, in *Ancient Geography*. See Coptos.

COPTITES *Nomos*, a nome of Egypt, extending along the bank of the Nile, which derived its name from Coptos or Coptis, its capital.

COPTOPSKILL, in *Geography*, a town of America, in the ſtate of New York; 42 miles N. of New York.

COPTOS, *Coptus*, or *Coptis*, in *Ancient Geography*, now *Kepht*, a city of Upper Egypt, three miles diſtant from the Nile, and connected with it by a navigable canal. It was the centre of communication between Egypt and the Red Sea, by a N.E. route to Myos Hormus, ſituated on the weſtern coaſt of the Red Sea, and by a S.E. courſe to Berenice, which was the ſtaple of the trade with India. If Plutarch is to be credited, Iſis, upon receiving the news of the death of Oſiris, cut off one of her locks in token of grief; and hence the place was named Coptos, which, in the Egyptian language, is ſaid to denote want or privation. This city was inhabited both by the Egyptians and Arabians, and Pliny calls it the emporium of commodities brought from India and Arabia, which were conveyed by the Nile to Alexandria. Pliny mentions Juliopolis, as being two miles diſtant from Alexandria, and ſays that from Juliopolis to Coptos, the voyage of 303 miles was performed in 12 days, when the northerly winds blew; the diſtance between Berenice and Coptos was, according to the ſame author, 258 Roman miles, and the journey was performed in 12 days. The road, however, lay through the deſart of Thebais, almoſt entirely deſtitute of water; but Ptolemy Philadelphus not only repaired the road, but made proviſion for ſupplying the want of water by ſearching for ſprings; and wherever theſe were found he built inns, or more probably in the eaſtern ſtyle caravanſeras, for the accommodation of merchants. (Strabo, lib. xvii. p. 1157.) In this channel the intercourſe between the eaſt and weſt continued to be carried on during 250 years, as long as Egypt remained an independent kingdom. The Chriſtians were formerly very numerous in the city of Coptos. The rubbiſh of this ancient city may fill a circumference of two miles, and ſufficiently evinces its former extent. Amidſt the ruins are ſeen ſeveral ſmall columns of grey granite lying on the ground, and ſome large ſtones, engraved with hieroglyphics. Near it is alſo a ſmall part of a bridge over the canal by which water was conveyed from the river into a large baſon. This place has occaſionally afforded medals, ſmall ſtatues of earthen-ware, pieces of rock cryſtal, and precious ſtones.

COPULA, in *Logic*, a verb that connects any two terms in a propoſition, either negative or affirmative: as, *A roſe is ſweet;* where *is* is the copula.

COPULATION. See Coition, Congress, and Consummation.

COPULATIVE *Propoſitions*, are thoſe which include ſeveral ſubjects, or ſeveral attributes joined together by an affirmative or negative conjunction.

Thus, v. gr. *Power and riches do not make a man happy.*

Where *and* is the conjunction that couples *power* and *riches*.

Copulative *Conjunction*. See Conjunction.

COPY, in *Law*, a tranſcript of a writing or inſtrument, made for the uſe and ſatisfaction of ſome of the parties concerned; or in order to preſerve the memory thereof. See Copia.

The copy of an inrolled deed is admitted in evidence; but not the copy of a will of lands nor the probates, nor of a common deed where the original may be procured. Few ancient documents do now ſubſiſt otherwiſe than in copies.

Copy is alſo uſed for an imitation of any original work; particularly a painting, draught, figure, &c.

The following proceſs for taking a copy of a recent MS., was communicated to the Philomathic Society at Paris, by M. Charles Coquebert. 'It conſiſts in putting a little ſugar in common writing ink, and with this the writing is made on common paper, ſized as uſual, when a copy is required; this unſized paper is taken and lightly moiſtened with a ſponge. The wet paper is then applied to the writing, and a flat iron, ſuch as is uſed by laundreſſes, of a moderate heat, being lightly paſſed over the unſized paper, the counterproof or copy is immediately produced. This proceſs is the more intereſting, as it requires neither machine nor preparation, and may be uſed in any ſituation. That ſugar prevents ink from ſpeedily drying, has been long known (ſee Ink); and this method of impreſſion has been uſed in ſome of our public offices, and elſewhere in England, for ſome years.

Copy, among *Printers*, denotes the manuſcript or original of a book given to print from.

To caſt off a copy, is to make a computation of the number of ſheets a manuſcript will make in print.

In the bookſellers' ſtyle, a *good copy* is that which produces a ſaleable book.

Tenant by Copy *of court roll.* See Tenant.

COPY-HOLD, is a tenure for which the tenant has nothing to ſhew but the *copy* of the roll made by the ſteward of the lord's court.

The ſteward of the court is, among other things, to inroll and keep a regiſter of all ſuch tenants as are admitted to any parcel of land, or tenement, belonging to the manor; and the tranſcript is called the *copy of the court-roll*, which the tenant keeps as his own evidence.

This tenure is called a *baſe tenure*, becauſe the tenant holds, in ſome ſort, at the will of the lord. Fitzherbert ſays, it was formerly called *tenure in villenage;* and that *copy-hold* is but a modern name.

This is the land which the Saxons called *folk-land*, as being held *ſine ſcripto*, in contradiſtinction to *bock-land*, or *charter-land*, *terra ex ſcripto*, and now *free land*, or *free hold*.

However, it is not ſimply at the lord's will, but according to the cuſtom of the manor; ſo that if the copy-holder doth not break that cuſtom, and forfeit his tenure, he ſeems not to ſtand at the lord's courteſy. Theſe cuſtoms are infinite; varying in one point or other, almoſt in every manor.

Copy-holders are, in reality, no other but villeins (ſee VILLEIN), who, by a long ſeries of immemorial encroachments on the lord, have at laſt eſtabliſhed a cuſtomary right to thoſe eſtates, which before were held abſolutely at the lord's will.

This affords a very ſubſtantial reaſon for the great variety of cuſtoms that prevail in different manors, with regard both to the deſcent of the eſtates, and the privileges belonging to the tenants. By various means the generality of villeins in the kingdom have long ago ſprouted up into copy-holders; their perſons being infranchiſed by manumiſſion, or long acquieſcence; and their eſtates, in ſtrictneſs, remaining ſubject to the ſame ſervile conditions and forfeitures as before; though, in general, the villein-ſervices are uſually commuted for a ſmall pecuniary quit-rent. In ſome manors the copy-holders were bound to perform the moſt ſervile offices; as to hedge and ditch the lord's grounds, to lop his trees, and reap his corn, and the like; the lord uſually finding them meat and drink, and ſometimes, (as is ſtill the caſe in the highlands of Scotland) a minſtrel or piper for their diverſion. Thus alſo, in the kingdom of Whidah, on the coaſt of Africa, the people are bound to cut and carry in the king's corn from off his demeſne lands, and are attended by muſic during the whole time of their labour. See WHIDAH.

The cuſtom of the manor is the life of copy-hold eſtates; for, without a cuſtom, or if copy-holders break their cuſtom, they are ſubject to the will of the lord; and as a copy-hold is created by cuſtom, it is alſo guided by cuſtom. (4 Rep. 21.) A copy-holder, whilſt he performs his ſervices, and doth not break the cuſtom of the manor, cannot be ejected by the lord; if he be, he ſhall have treſpaſs againſt him:—but if a copy-holder refuſe to perform his ſervices, it is a breach of the cuſtom, and forfeiture of his eſtate. Some copyholders hold by the *verge* in *ancient demeſne*; ſo that though they hold by copy, they are a kind of free-holders; ſome others hold by common tenure, called "mere copy-hold," whoſe land, upon the commiſſion of felony, eſcheats to the lord of the manor.

It ſhould be recollected, however, that copy-hold land cannot be made at this day; for the foundation of a copy-hold is, that it hath been demiſed time out of mind, by copy of court-roll; and that the tenements are parcel of, or within the manor. 1 Inſt. 58. 4 Rep. 24.

Eſtates held by copy of court-roll, and not at the will of the lord, have been deemed free-hold by lord Coke (1 Inſt. 59 *b*.) and alſo by others; and by way of diſtinction from the ordinary kind, they have been denominated "cuſtomary free-holds." Tenants of this deſcription have claimed the right of voting at the election of the knights of the ſhire. But the ſtat. 31 Geo. II. c. 14, enacts, that no perſon holding by copy of court-roll, ſhould have this privilege.

In ſome manors, where it has been the cuſtom to permit the heir to ſucceed the anceſtor in his tenure, the eſtates are ſtyled "copy-holds of inheritance;" in others, where the lords have been more vigilant to maintain their rights, they remain "copy-holds for life," only; for the cuſtom of the manor has, in both caſes, ſo far ſuperſeded the will of the lord, that provided the ſervices be performed or ſtipulated for by fealty, he cannot, in the firſt inſtance, refuſe to admit the heir of his tenant upon his death; nor, in the ſecond, can he remove his preſent tenant, ſo long as he lives, though he holds nominally by the precarious tenure of his lord's will. If the lord refuſes to admit, he ſhall be compelled in chancery. (2 Cro. 368.) And if the lord refuſe to admit a ſurrendree, on account of a diſagreement about the fine to be paid, the court of B. R. will grant a mandamus to compel the lord to admit without examining the right to the fine. (2 Term Rep. 484.) But that court will not grant a mandamus to admit a copy-holder by deſcent; becauſe, without admittance, he has a complete title againſt all but the lord. (2 Term Rep. 198.) Copy-holds deſcend, according to the rules and maxims of the common law (unleſs in particular manors there are contrary cuſtoms of great antiquity); but ſuch cuſtomary inheritances ſhall not be aſſets, to charge the heir in action of debt, &c. (4 Rep. 22.) though a leaſe for one year, of copy-hold lands, which is warranted by the common law, ſhall be aſſets in the hands of an executor. (1 Vent. 163.) Copy-holders hold their eſtates free of dower, being created by cuſtom, which is paramount to title of dower. (4 Rep. 24.) By particular cuſtom, there may be dower and tenancy by the curteſy. (Cro. Eliz. 361.) There may be an eſtate-tail in copy-hold lands by cuſtom, with the co-operation of the ſtat. W. II. And as a copy-hold may be entailed by cuſtom, ſo by cuſtom the tail may be cut off by ſurrender. (1 Inſt. 61.) A copy-hold may be barred by a recovery, by ſpecial cuſtom; and a ſurrender may bar the iſſue by cuſtom. A fine and recovery at common law will not deſtroy a copy-hold eſtate; becauſe common law aſſurances do not work upon the aſſurance of the copy-hold; though copy-hold lands are within the ſtat. 4 Hen. VII. c. 24, of fines and proclamations, and five years non-claim, and ſhall be barred. (1 Rol. Abr. 506.) Copy-holds are not within the ſtatute 27 Hen. VIII. c. 10, of jointures; nor ſtat. 32 Hen. VIII. c. 28, of leaſes; copy-holds being in their nature demiſable only by copy; they are not within the ſtatute of uſes; nor are copy-holds extendible in execution; but they are within the ſtatute of limitation of actions, and the ſtatutes againſt bankrupts. The lord ſhall have the cuſtody of lands of ideots, &c. And a copy-holder is not within the act 12 Car. II. c. 24, to diſpoſe of the cuſtody and guardianſhip of the heir; for, if there be a cuſtom for it, it belongs to the lord of the manor. (3 Lev. 395. 1 Nelſ. Abr. 492, 522.) A copy-holder cannot convey or transfer his copy-hold to another, otherwiſe than by *ſurrender*; which ſee.

A manor may be held by copy of court-roll, and the lord of ſuch manor may grant copies; and ſuch cuſtomary manor may paſs by ſurrender and admittance, &c.

The fruits and appendages of a copy-hold tenure, which it hath in common with free tenures, are fealty, ſervices, (as well in rents as otherwiſe,) reliefs, and eſcheats. The two latter belong only to copy-holds of inheritance, the former to thoſe for life only. Beſides theſe, copyholds have alſo heriots, wardſhips, and fine. See each of theſe articles. See alſo FORFEITURE, FREEHOLD, SURRENDER, and TENURE.

COPY-HOLDER, is defined by Weſt, a perſon admitted tenant of any lands, or tenements, within a manor, which, time out of mind, by the uſe and cuſtom thereof, have been deviſable to ſuch as will take the ſame by copy of court-roll, according to the cuſtom of the ſaid manor.

COPYING *of* Letters, *and other writings.* The celebrated Dr. Franklin made ſeveral eſſays, many years ago, for ſpeedily multiplying the copies of his own hand-writing, which he exhibited to M. Alexis Rochon, of the French National Inſtitute, and director of the Marine Obſervatory at the port of Breſt; an account of which he has given in his memoir on the Typographic Art. This method conſiſted in writing upon ſmooth paper, with ink containing much gum, which was afterwards ſanded with emery, or powder of caſt-iron, and by means of a rolling-preſs, ſuch as is uſed by the copper-plate printers, the ſtrokes of the writing were transferred to a plate of roſe copper or pewter. This plate ſupplies as many copies as the depth of the engraving can allow; but the copies are far from being beautiful, and the ground is ſpotted and ſpoiled. Before Dr. Franklin's proceſs was communicated to M. Rochon, he ſhewed him that by writing with a ſteel point on a copper-plate previouſly varniſhed, a more ſatisfactory reſult might be obtained, by etching the ſtrokes with nitric acid to a ſufficient depth, for the ſubſequent uſe of a liquid ink ſimilar to that of the printers. In this caſe, the plate may be wiped without precaution, and twelve or more copies may be pulled off upon coarſe paper. Theſe proofs are foul and reverſed; and, therefore, in order to have them neat and in the proper direction of the writing, it becomes neceſſary to place the ſame number of leaves of white paper, wetted and prepared, upon the twelve proofs; and while the ink is ſtill freſh, the whole being paſſed together through the rolling-preſs, the ſame number of leaves of counter-proofs are obtained as there were proofs; ſo that inſtead of twelve turns of the preſs, thirteen will be required to ſupply twelve counter-proofs, very black, neat, and legible, even when the plate has not been perfectly wiped. This method is certainly not to be compared with fine engraving; but it may be uſeful in military operations, and all other caſes in which a ſpeedy multiplication of copies is required. No precaution is here neceſſary; whether the nitrous acid be more or leſs ſtrong, or remain a longer or ſhorter time upon the plate, or whether the plate be ſomewhat heated to increaſe the ſtrength of the ſolvent, the proceſs of the operation will never fail; provided the ſteel point made uſe of to trace the characters through the varniſh, ſhall lay the copper perfectly bare. It is of advantage that the nitric acid ſhould bite deep, becauſe the counter-proofs are, by theſe means, much darker. The plate need not be well wiped, becauſe it is of no conſequence whether the proof which is uſed to afford a counter-proof ſhould be very clean, provided that it does not ſpot the copy intended to be procured. The moſt liquid kind of printers ink may be uſed. See Engraving and Stereotype.

In 1780, Mr. James Watt, of Birmingham, obtained a patent for a new method which he had invented to this purpoſe; of which the following deſcription is given in his ſpecification: Let the letter or other writing, that is intended to be copied, be written with the ink hereinafter deſcribed, or with any other writing-ink fit for the purpoſe. Take a piece, or pieces, of thin paper which contains no ſize, or glue, or gummy or mucilaginous matter, or which at leaſt does not contain ſo much ſize, or other matter, as would make it fit for being written upon. Cut this paper, or papers, to the ſize and ſhape of the writing of which a copy is wanting; moiſten or wet the ſame thin paper with water, or other liquid, by means of a ſpunge or bruſh, or by dipping, or otherwiſe. Having moiſtened or wet the thin paper, lay it between two thick unſized ſpungy papers, or between two cloths, or other ſubſtances capable of abſorbing the ſuperfluous moiſture from the thin paper; when it has been ſlightly preſſed between ſuch thick ſpungy papers, or other ſubſtances, by the hand or otherwiſe, lay the ſaid thin paper, ſo moiſtened and preſſed, upon or under the ſide of the writing which is to be copied, and in ſuch manner that the one ſide of the ſaid moiſtened paper ſhall be in contact all over the ſide of the ſaid writing, ſo intended to be copied; and that to the other ſide of the ſaid moiſtened thin paper, there ſhall be applied a piece of clean writing-paper, or cloth, or other ſmooth uniform ſubſtance. Lay the ſaid writing intended to be copied, with the thin moiſtened paper intended to receive the copy, (placed reſpectively as above directed,) upon the board of a common rolling-preſs, or of that of which a deſcription and drawing are hereunder written and drawn, and preſs them once, or oftener, through the rolls of the ſaid preſs, in the ſame manner as is uſed in printing by copper-plates; or, inſtead of uſing the ſaid or any rolling-preſs, ſqueeze the ſaid papers, placed reſpectively in the manner above deſcribed, in a ſcrew-preſs; or ſubject them to any other preſſure ſufficient for the purpoſe; by means of which preſſure, in whatever manner applied, part of the ink of the writing intended to be copied ſhall preſs from the ſaid writing into, upon, and through, the ſaid thin moiſtened paper, ſo that a copy of the writing, more or leſs faint, according to the quality of the ink and paper employed, ſhall appear impreſſed on both ſides of the ſaid moiſtened paper, *viz.* upon one of the ſides in the natural or proper order and direction of the lines, as they are in the original writing, and on the other ſide in the reverſe order and direction. But, in order to make the impreſſion or copy of the writing more ſtrong, legible, and durable, it is proper and uſeful to moiſten the ſaid thin paper, which is to receive the copy or impreſſion, with the following liquor, inſtead of water or other liquid, and to proceed in all other reſpects as is above directed; or to moiſten the ſaid thin paper with the following liquor, and to dry the ſaid paper, and, when a copy of a writing is required to be taken, the ſaid paper, thus previouſly prepared and dried, ought to be moiſtened with water or other liquid, and to be proceeded with in all other reſpects as has been directed. The ſaid liquor to be uſed for moiſtening the ſaid thin paper, or for preparing the ſaid paper previouſly to its being uſed, is made in the following manner: Take of diſtilled vinegar two pounds weight, diſſolve in it one ounce of the ſedative ſalt of borax; then take four ounces of oyſter-ſhells, calcined to whiteneſs and carefully freed from their brown cruſt, put them into the vinegar, ſhake the mixture frequently for four-and-twenty hours, then let it ſtand until it depoſits its ſediment; filter the clear part through unſized paper into a glaſs veſſel, then add to the ſaid mixture or ſolution two ounces of the beſt blue Aleppo galls bruiſed, and place the liquor in a warm place, ſhaking it frequently for twenty-four hours; then filter the liquor again through unſized paper, and add to it, after filtration, one quart, ale meaſure, of diſtilled or other pure water. It muſt then ſtand twenty-four hours, and be filtered again if it ſhews a diſpoſition to depoſit any ſediment, which it generally does. The liquor, thus compounded and prepared, is to be uſed as hath been directed.

N. B. In place of the vinegar, any other liquor impregnated with a vegetable acid may be uſed; and, in place of the galls, oak bark, or any other vegetable aſtringent, or ſubſtance which is capable of becoming black, or deep coloured, with ſolutions of iron; and, in place of the oyſter-ſhells, any other pure calcareous earth may be uſed. But if the impreſſions are not wanted to be very black, and the writing ink is good, water itſelf may be uſed to moiſten the thin paper, as herein firſt directed. It may be found neceſſary to add more or leſs water, in the preparation of the above liquor to be uſed for moiſtening the thin paper, or to vary the proportions of the other ingredients, according as they are more or leſs perfect or ſtrong, or as the impreſſion is required to be more or leſs deep coloured. The writing-ink, which the patentee uſes for letters or writings intended to be copied, is prepared as follows: Take four quarts, ale meaſure, of ſpring water; one pound and a half, avoirdupoiſe weight, of Aleppo galls; half a pound of green copperas or green vitriol; half a pound of gum-arabic; four ounces of roach-alum; pound the ſolid ingredients, and infuſe them in the water ſix weeks or two months, during which time the liquor ſhould be frequently ſhaken; ſtrain the liquor through a linen cloth, and keep it in bottles, cloſely corked, for uſe.

Plate III. *Miſcellany, fig.* 1. repreſents a front or end view of the rolling-preſs invented by Mr. Watt, and referred to in the above ſpecification. A B C is one of the ends of an iron or wooden frame, which ſerves to connect the two rollers. D, D, are two wooden or metalline rollers, turned extremely exact, or truly cylindrical, and which are mounted on iron axles, firmly fixed in them. E E is a double-ended lever, by means of which the roller, on whoſe axle it is applied, may be forcibly turned round. F F repreſents the board of the rolling-preſs, on which the writings to be copied are to be laid. N N is a piece of cloth, or other elaſtic pliable ſubſtance, placed next the roller, and above the writings to be copied; and the board, G, is a ſtrong plank of wood, or plate of metal, ſerving to connect the two end-pieces of the frame at bottom. H H repreſents the edge of a common table, to which the preſs may be faſtened by the iron ſcrew-cramps I, I. K is a ſlit, of which there is one in each end-piece of the frame; theſe ſlits are filled with elaſtic ſteel, or other metalline ſprings, or with ſome other elaſtic ſubſtances which ſerve to preſs the two rollers forcibly together. L is a braſs bolſter, ſupported upon the ſprings, and ſerving to ſupport the end of the axis of the under roller.

Fig. 2. repreſents a ſide-view of the rolling-preſs, in which A B, A B, are the two end-pieces of the frame. D, D, are the two rollers. E is the double-ended lever. G is a ſtrong plank, or plate of metal, which forms the bottom of the frame. H H is the table on which the preſs ſtands. I is one of the iron cramps which faſten the preſs to the table; and M is a bar of iron which connects the upper part of the frame.

Fig. 3. repreſents a ſcrew-preſs, which may be uſed, inſtead of the rolling-preſs, in taking off impreſſions from writings. A A is a double-ended lever. B B the ſcrew. C a block of wood, or metal, which the ſcrew acts upon, and which is attached to it. D D the frame of the preſs, made of iron or wood. E E is a moveable board, on which the writing to be copied is to be laid, with a cloth over it. F F the bottom or ſole of the preſs, made of wood or metal. Be it remembered, that theſe preſſes are made of different ſizes, according to the ſizes or largeneſſes of the writings intended to be copied. Thoſe now referred to are drawn from one ſufficiently large to take an impreſſion from a folio page of writing or poſt paper, and are drawn to a ſcale of one inch and a half for each foot, or one-eighth of their natural ſize.

Fig. 4. repreſents one of Hawkins's patent polygraphs, for making two or more copies of any writing at once. A A B, is an upright frame, from the upper piece of which is ſuſpended a double parallel ruler, D D, E E; *d d*, *e e*, is another ſimilar parallel ruler, of which *fig.* 5. is a plan, faſtened to the board, F F, of the inſtrument. Theſe two rulers are connected to a ſtout bar, G; the vertical one, D D E E, by pivots at the end of the bar, H, *fig.* 4. going into holes in the projecting part of two pieces of braſs, *g g*, at each end of G; and the horizontal one, *d d e e*, by pivots at the ends of its correſponding bar, *h*, working in holes in another arm of the ſame braſſes. The pens are connected with the bar, G, by a curved braſs limb, *a*, turning on a ſcrew put through the bar, G, as a centre. On the other ſide of the bar is a ſhort arm, *b*, in the ſame piece with the limb: this is jointed at its upper end to the end of a ſmall rod, *i*, the other end of which is jointed to another exactly ſimilar limb, carrying the other pen. The pens are fitted into a ſmall tube, called the pen-tube, having a ſhoulder at its upper end. This fits tight into another tube, in the ſame piece with the curved limb, and is puſhed in as far as the ſhoulder of the pen-tube will allow.

The weight of the machinery is ſuſpended by eight ſmall ſpiral ſprings, I, faſtened to a ring fixed to the bar, G; their upper ends are connected with the end of a double jointed lever, K, which can follow the motion of the bar, G, without ſtretching the ſprings too much. The rod, L, by which the perpendicular motion is ſuſpended, turns upon pivots working in pieces of braſs beneath the piece, B: the right-hand one is called a regulator, and has two ſcrews, one moving the pivot vertically, and the other horizontally, for adjuſting the inſtrument. The two bars, *e e*, of the horizontal motion are connected with *d d* by pivots at the end of *h*, ſo that *d d* can be lifted up without moving the other, whoſe weight is ſupported upon two ſmall braſs wheels *i, i*. The frame, A A B, when the inſtrument is not in uſe, turns down on the board, F F, and is kept faſt by a ſpring lock, which is opened by puſhing in a round button, *k*. The frame now forms the ſides, and the front board becomes the lid, and, when ſhut down, is locked by a lock, M. In explaining the uſe of the inſtrument, we cannot do better than copy the printed directions ſold with the inſtrument. Chooſe two gooſe quills, taking care they are of the ſize wanted; make them into pens, and put them into the pen-tubes. Having introduced them with the nibs firſt, apply the ſhoulder end of the pen-tube againſt the ſemi-circular hollow, in the upright part of the gauge, Q, *fig.* 4. and puſh the pen through the tube, till the nib reaches a line drawn acroſs the end of the gauge; ſlide the pen-tube into the fixed ſocket, until the ſhoulder of the pen-tube ſtop it, holding by the fixed ſocket, and not by the work, ſo as not to ſtrain the machinery. If the polygraph is in order, the pens will now write, draw, or copy whatever may be required, with the greateſt exactneſs. To prove the machine's being in order, bring the pens to the upper part of the paper, and try if they both touch; if not, with a ſmall ſcrew-driver turn the perpendicular ſcrew of the regulator, till they touch equally. Bring the pens to the bottom of the paper, and move the horizontal ſcrew till they both touch. When a pen wants mending, nothing more is neceſſary than to take the pen-tube out of the ſocket, mend the pen, gauge it, and return it into the ſocket again. When the machine is out of uſe, wipe the pens clean, and place the left one, with the curved limb, on the hook beneath the horizontal rulers. Let down the frame, A A B, which faſtens by a ſpring-lock, and at the ſame time raiſes the writing-board, which then becomes the lid of the portable caſe for the polygraph.

The patent now belongs to Mr. Farthing, Cornhill, who manufactures the inſtruments.

Theſe inſtruments are made with three, four, and five pens, and anſwer the purpoſe very well.

COPYIST, in DIPLOMATIC *Science*, ſignifies a tranſcriber or copier of deeds, books, &c.

COPYIST, a tranſcriber of *Muſic*. Whatever improvements have been made in literary typography, no muſic printed with types has equalled that of writing, engraving, or ſtamping. Rouſſeau has extended this article to a greater length than ſeems neceſſary. It is indeed neceſſary for a *copyiſt* to know practical muſic well, and to be ſufficiently acquainted with compoſition to avoid groſs miſtakes himſelf and detect them in others; to write a neat and legible hand; to know the Italian and French technieu, to form all the characters in a bold and clean manner; and, by underſtanding the language of muſic, leaving no bar incomplete, by omiſſion or redundance. Theſe ſeem to be all the neceſſary requiſites of a good *copyiſt*, if to them be added care and accuracy, particularly in forming a ſcore, where quantity muſt be attended to in the exact arrangement of the notes over each other. Muſic has long been very neatly engraved in France, on copper; and in Holland, though leſs neat, with more force and diſtinctneſs: 60 or 70 years ago, the Dutch editions of the works of Corelli were much ſought all over Europe; and 30 or 40 years ago, there was no muſic printed in Italy or Germany; all was MS. By which employment ſo many *copyiſts* obtained a livelihood, that it was thought a cruelty to ſhorten labour by the preſs; as in the firſt attempts at erecting ſilk and cotton-mills. Works in literature, till the invention of the preſs, muſt have been diſſeminated very ſlowly by tranſcription; perhaps by the medium of the preſs works of little merit, and of corrupt and noxious principles, have been too eaſily multipled, and put in circulation. And indeed cheapneſs has not been eventually the conſequence of muſical typography, ſtamping, or engraving; as printed muſic is now dearer than written was, early in the laſt century.

COPY-RIGHT. See *Literary* PROPERTY.

COQ. *ad med. conſumpt.* an abbreviature among *Phyſicians*, ſignifying that the thing is to be boiled till half of it be conſumed.—*Coq. in S. Q. Aq.* implies it to be boiled in a ſufficient quantity of common water.

COQUALLIN, in *Zoology*, the SCIURUS *variegatus* of Gmelin, and *varied ſquirrel* of Pennant.

COQUANTOTOTL, in *Ornithology*, a bird of the warmer climates of America, deſcribed by Seba under this name: it is a ſmall creſted-bird, ſhaped like a ſparrow; the PIPRA *Griſea* of Gmelin, the *manacus criſtatus griſeus* of Briſſon, and the *gray manakin* of Latham.

COQUAR, the variety *hybrida*, ε. of Gmelin's PHASIANUS *Colchicus* and the pied-pheaſant of Hayes's Britiſh birds.

COQUATOTOTL of Hernandez and Ray, the variety β. of Gmelin's AMPELIS *garrulus*, the *chatterer* of Carolina of Edwards and Cateſby.

COQUES, GONZALO, in *Biography*, a painter who was born at Antwerp in 1618, and became the diſciple of David Ryckaert the elder. He ſoon gave proofs of extraordinary talents in ſmall pictures; and the early friendſhip which he formed with the ſon of Ryckaert, whoſe name was likewiſe David, did not a little contribute to rouſe his emulation, and quicken his diligence. His firſt eſſays, after the example of his maſter, were domeſtic ſubjects and converſations, in the manner of Teniers and Oſtade; but his admiration of the works of Vandyke, ſoon cauſed him to adopt a ſtyle, in which the beautiful and pictureſque grouping of his former models acquired additional intereſt, by being united to greater elegance and dignity of character. In this manner he painted a picture for Jacques Le Mercier, a rich merchant of Antwerp, which gained him great applauſe. It repreſented his employer with his wife and children at table: the painter himſelf was introduced in profile. From this period he devoted himſelf principally to the painting of ſmall portraits, which he executed with ſuch delicacy and happy effect, that excepting Vandyke, no artiſt of his time enjoyed a greater reputation. He was employed by the court of Bruſſels, Charles I. king of England, and ſeveral other potentates. He died in 1684, leaving conſiderable riches to his family. Deſcamps.

COQUET, in *Geography*, a river of England, in Northumberland, which runs into the ſea ſeven miles S.E. of Alnwick, at Hawkſley, and is navigable for about 12 miles up to Warkworth bridge.—Alſo, a ſmall iſland of England, in the German ocean, about a mile in circumference, near the coaſt of Northumberland. It was taken by the Scots in the reign of Charles I. N. lat. 55° 13′. W. long. 1° 36′.

COQUETTE, a female character, no leſs contemptible than odious; againſt the iniquity of which Mr. Giſborne, in his excellent treatiſe, "On the Duties of the Female Sex," cautions his readers in the following deſcriptive and impreſſive terms. "To delude a young man by encouraging his attentions for the pleaſure of exhibiting him as a conqueſt, for the purpoſe of exciting the aſſiduities of another perſon, or from any motive except the impulſe of mutual regard, is a proceeding too plainly repugnant to juſtice, and to delicacy of ſentiment, to require much obſervation. On ſuch ſubjects, even inadvertence is highly culpable, what then is the guilt of her, who deliberately raiſes hopes which ſhe is reſolved not to fulfil!"

COQUILLADE, in *Ornithology*, the ALAUDA *undata* of Gmelin and *undated lark* of Latham.

COQUILLES A BOULETS, ſhells or moulds for bullets. They are made either of braſs or iron. Two of them are required for the caſting of a cannon-ball. And they never join or cloſe ſo effectually, as to prevent the liquid metal when poured in from running ſomewhat out at the ſeam, where they join. This ſmall part of the metal, or excreſcence of the bullet, is called the beard, which is broken or knocked off to make the ball perfectly round.

COQUIMBO, or LA SERENA, in *Geography*, one of the 13 provinces of Chili in South America. This is a rich, verdant fruitful valley, not far from the coaſt of the South Sea, producing corn ſufficient for conſiderable exportation to Lima, and abounding with various mines. One mine of copper, ſituated about 5 leagues N. from the town of Coquimbo on mount Carro Verde, or Green Hill, riſes to a conſiderable elevation in form of a ſugar-loaf, and ſerves as a land-mark to the port. The climate is ſingularly agreeable, being almoſt uniformly mild and ſerene.

COQUIMBO, or *La Serena*, the capital of the fore-mentioned province, was the ſecond town built by Valdivia, in the kingdom of Chili, in 1544, for the purpoſe of maintaining an intercourſe between Peru and Chili, in order to procure a regular ſupply, and to ſecure the fidelity of the Indians who lived in that valley. The town ſtands about ¼ of a league from the ſea in a moſt delightful ſituation, commanding an extenſive proſpect of the ſea, a river of the ſame name, and the country, and preſenting to view a charming variety of fields, with different kinds of grain and woods of a lively verdure. The town is large but not proportionably populous; the number of families not amounting to above four or five hundred, conſiſting of Spaniards, Meſtizos, and a few Indians. The ſtreets are conveniently wide, interſecting one another from north to eaſt, and from eaſt to weſt, ſo as to form ſquares of buildings, with intervals for gardens. The houſes are conſtructed with mud walls and covered with leaves, and each of them is provided with a large garden, planted with fruit trees and eſculent vegetables. It has ſeveral pariſh churches, and three convents, and alſo a town-houſe, where the Alcaldes and Regidores meet, who, with the corregidor, form the corporation. On the north ſide of the town runs the river; after flowing in various meanders through the whole valley of the ſame name; and, by canals cut from it, furniſhes the town with water, which is principally applied to preſerve the fertility and beauty of their gardens. The river at its mouth forms a very fine bay, where ſhips lie ſafely and commodiouſly, though the coaſt is rocky; ſome iſlands lying ſo as to keep off the winds. S. lat. 29° 52′. W. long. 71° 19′.

COR, in *Geography*, a town of Chineſe Tartary, in the deſert of Cobi. N. lat. 44° 16′. E. long. 93° 29′.

Cor, in *Anatomy*. See Heart.

Cor, *Fr.* Corno, *Ital.* in *Muſic*. A horn.

Cor *de Chaſſe* is a very long and inſtructive article in the Encycl. Meth.; but the plates, to which the reader is frequently referred, not being yet publiſhed, the precepts for performing on the inſtrument, if tranſlated, would not be intelligible.

Cor, in *Natural Hiſtory*. See Chama.

Cor *Caroli*, in *Aſtronomy*, an extra-conſtellated ſtar of the ſecond magnitude in the northern hemiſphere, ſituated between the Coma Berenices and Urſa Major; ſo called by ſir Charles Scarborough, in honour of king Charles I.

Cor *Hydræ*, a ſtar of the ſecond magnitude, in the heart of the conſtellation Hydra.

Cor *Leonis*, or *Regulus*, a fixed ſtar of the firſt magnitude, in the conſtellation Leo.

Cor *Scorpii*. See Antares.

Cor *Anguinum*, in *Natural Hiſtory*, a ſpecies of Echinus found only in a foſſile ſtate.

Cor *Bovis*. See Cardium Aculeatum.

Cor *Marinum*, the name of one of the claſſes of the *echini marini*, the characters of which are, that the anus is placed in the ſide of that point of the ſhell which appears as if cut off; and the mouth has two lips, and is placed in the third region of the axis of the baſe. Klein's Echin. p. 34.

Cor *Veneris*, *Venus's heart*. See Cardium Cardissa.

CORA, in *Ancient Geography*, a town and Latin colony of Italy, in the country of the Volſci, according to Virgil, Silius Italicus, and Livy; now *Cori*. This is a town of Latium on the left of the Appian way, S. E. of Velitræ. By its ruins we may conclude, that it was a place of importance: among theſe we diſcover a temple of Caſtor and Pollux, and an aqueduct for conducting water, &c. The ancient walls are ſtill remaining.—Alſo, a town of Italy, ſituated in a promontory of Etruria. Juſtus Lipſius ſays, that in the paſſage of Tacitus which mentions it, we ought to read *Coſa*, which is not improbable.

CORAAGE, Coraagium, in our *Old Cuſtoms*, a kind of impoſition extraordinary, growing upon ſome unuſual occaſion; and it ſeems to be of certain meaſures of corn; for *corus tritici* is a meaſure of wheat. Bracton, lib. ii. cap. 116. num. 6. who, in the ſame chapter, num. 8. has theſe words: "Sunt etiam quædam communes præſtationes, quæ ſervitia non dicuntur, nec de conſuetudine veniunt, niſi cum neceſſitas intervenerit, vel cum rex venerit; ſicut ſunt hidagia, coraagia, & carvagia, et alia plura de neceſſitate et ex conſenſu communi totius regni introducta, &c."

CORACA, or Corace, in *Ancient Geography*, a town of Arabia Petræa. Ptolemy.

CORACE, in *Geography*, a river of Naples, which runs into the gulf of Squillace; four miles ſouth of Balicaſtro.

CORACESIUM, a fortified place of Aſia in Cilicia, according to Pliny and Strabo; the latter of whom ſays, that it was ſituated on a rugged rock at the extremity of Cilicia.

CORACIAS, in *Ornithology*, a genus of the order, *Picæ*, or Pies. The birds of this genus have the bill ſharp at the edges, the tip incurvated, and the baſe bare of feathers; tongue cartilaginous and bifid; feet formed for walking.

The coracias genus comprehends only thoſe birds which are known by Engliſh writers under the title of *Roller*, amounting altogether to between twenty and thirty ſpecies. In Dr. Latham's ſynopſis it is obſerved, that the bill of the roller is ſtraight, bending towards the tip, with the edges cultrated; the noſtrils narrow and naked; and the legs for the moſt part ſhort, with the toes placed three before and one behind, the whole of which are divided to their origin. It differs from the corvus, or crow tribe, chiefly in the noſtrils being deſtitute of reflected briſtles, and having the legs ſhorter. Briſſon makes a particular genus of pies under the name of coracias, including thoſe birds of the Linnæan genus corvus which have the beak a little bent or arched. The coracias of the lateſt French writers, it may be likewiſe remarked, belongs to the corvus genus both of Gmelin and Latham, as for example, the corvus graculus (*Corniſh chough*) and corvus eremita (*Hermit crow*), &c. of the two laſt mentioned writers are referred to the coracias genus by the French.

The roller tribe is not confined to any particular part of the world like ſome other genera of birds, but the far greater number of its ſpecies are found in warm climates.

Only one ſpecies of the roller has been yet diſcovered in England, the *garrulous roller*, *coracias garrula*.

Garrula. Blue, back red; quill-feathers black. Linn. Fn. Sv. Common roller. Penn.—Donov. Brit. birds. *Pica marina et garrulus argentoratenſis*, Ray. *Galgulus*, Briſſon. *Rollier*, Buffon. *Gazza marina*, Zinan.

A beautiful bird, in ſize ſomewhat inferior to the common jay; the head, neck, breaſt, and belly are of a fine bluiſh-green, the back and ſcapulars reddiſh-brown; coverts on the ridge of the wing rich blue; the tips of the quill feathers duſky above, beneath blue; the tail forked with the two middle feathers obſcure green, the reſt blue with the tip on the outer edge black; legs ſhort and dirty yellow.

This ſpecies inhabits various parts of Africa, and Europe, but in greateſt numbers in the warmer regions; in the north of Europe they are uncommon, in England very rare. It has obtained the name of garrulous roller in alluſion to its chattering noiſe. The ſpecies is of the migratory kind, gregarious and timid, and builds in trees, particularly the beech. In the ſouth of Germany it is ſeen in flocks in autumn, in company with the rooks and other birds ſearching for worms, ſmall ſeeds and roots, in tilled, or cultivated grounds.

Bengalensis. Somewhat fulvous, beneath bluiſh; neck beneath violet with paler ſtreaks; tail entire. Lath. *Coracias bengalenſis*, Linn. *Galgulus mindanoenſis*, Briſſ. *Rollier de Mindanao*, Buff. *Le cuit*, ibid. Jay from Bengal, or Bengal Pye, Albin. *Bengal roller*, Lath.

Inhabits Bengal and the iſle of Mindanao. Dr. Latham obſerves that it does not eſſentially differ from the following ſpecies, the chief difference being the rufous violet colour on the breaſt, and the want of the long outer tail-feathers. The bengalenſis, he thinks, may be perhaps the female or a young bird, as the long tail-feathers of coracias caudata do not appear till the ſecond year. Lath. Gen.

Syn. In Ind. Orn. of the ſame writer, ſince publiſhed, theſe two birds are conſidered as diſtinct ſpecies.

Caudata. Somewhat fulvous, beneath blueiſh; neck beneath violet, ſtreaked with paler; the outer tail-feathers very long. Linn. *Galgulus angolenſis*, Briſſ. *Rollier d'angola*, Buff. *Long-tailed roller*, Lath.

A native of Angola, and meaſures fifteeen inches and a half in length.

Senegala. Reddiſh fuſcous; beneath, head, tail, and upper part of the wings blueiſh ſea-green; face white, ſhoulders and quill-feathers blue; exterior tail-feathers very long. Lath. *Coracias ſenegalenſis*, Gmel. *Rollier de Senegal*, Buff. *Swallow-tailed Indian roller*, Edwards. *Senegal roller*, Lath.

This is rather leſs than the common jay. The bill black; the whole ſpace round the baſe of the bill white; head and under parts of the body, the upper parts of the wings, and tail, blueiſh-ſea-green; ſhoulders and quills deep blue; the outer tail-feathers of great length as in the laſt ſpecies; hind part of the neck, and the back of a reddiſh-brown; the legs of a reddiſh-fleſh-colour. It inhabits Ceylon and Senegal.

Abyssinica. Rufous-brown; head, neck, body beneath, and wing-coverts green; ſhoulders, greater quill-feathers, and rump blue; outer tail-feathers very long. Lath. *Coracias Abyſſinica*, Gmel. *Rollier d'Abyſſinie*, Buff. *Abyſſinian roller*, Lath.

The bill of this bird is black; tip of the upper mandible much bent; ſides of the head from the noſtrils to a little beyond the eyes are white; the reſt of the head, neck, and under parts of the body fine green; the two middle feathers of the tail are duſky, with a gloſs of blue eſpecially down the middle, the outer ones blue-green: the two exterior tail-feathers are five inches longer than the reſt, and the end, beyond the extremity of the others, of a fine deep blue; the legs are red-brown. A native of Abyſſinia.

Orientalis. Green; throat ſtriated with blueiſh; tail-feathers black at the tip. Lath. Linn. *Galgulus indicus*, Briſſ. *Rollier des Indes*, Buff. *Oriental roller*, Lath.

A native of the Eaſt Indies. Its ſize is that of a jay, the length ten inches and a half; the bill yellowiſh, broader at the baſe, and more hooked than in any of the genus; the head and hind part of the neck brown; back, rump, and ſcapulars, with the wing and tail-coverts, green-brown; throat fine blue; down the ſhaft of each feather a pale line, the other parts beneath blue-green; quills blue and black, with a large pale blue ſpot. The wings are longer than in the other ſpecies of roller; the tail even at the end, the two middle feathers green at the baſe, with the other part black; legs yellowiſh with black claws.

Indica. Blue, fore-part teſtaceous; cap green. Linn. *Blue jay* from the Eaſt Indies. Edwards. *Indian roller*, Lath.

The length of this bird is eleven inches. The bill is duſky, an inch and a half in length; the crown of the head blue-green; throat, breaſt, neck, and back, reddiſh-brown, with the ſides of the head and throat darkeſt, ſtreaked with white; rump and tail, with the under-parts from the breaſt, fine cyaneous blue; the middle feathers of the tail green, the outer ones blue at the bottoms and tips, in the middle ſea-green; the wings green and blue. A native of Ceylon.

Caffra. Blue, exterior edge of the quill-feathers pale-yellow. Linn. *Cape roller*, Lath. Inhabits Ethiopia; an obſcure ſpecies deſcribed on the authority of Linnæus.

Vivida. Entirely of a moſt vivid blue. Lath. *Coracias cyanea*, Gmel. *Ultramarine roller*, Lath.

Length of this ſpecies eight inches; the bill duſky. Native place unknown.

Madagascariensis. Purple-brown; rump, vent, and tail blueiſh-green; tail towards the tip marked with a purpliſh band, tip and quill-feathers dark blue. Gmel. *Rollier de Madagaſcar*, Buff. *Madagaſcar roller*, Lath.

A beautiful ſpecies found in Madagaſcar. The length of this bird is ten inches; the bill is very ſtout at the baſe, rather ſhort and of a yellow colour; the legs reddiſh-brown.

Mexicana. Reddiſh-grey; beneath and on the wings pale grey mixed with flame colour. Gmel. *Galgulus mexicanus*, Briſſ. *Merula mexicana*, Seba. *Rollier de Mexique*, Buff. *Mexican roller*, Lath.

Larger than a thruſh, and inhabits Mexico.

Puella. Blue, collar in front, and at the ſide, with the breaſt, belly, quill-feathers, and greater wing-coverts black. *Fairy roller*, Lath.

Size of a blackbird, and inhabits India.

Striata. Blue-black, ſtreaked with greeniſh-blue; bill, tail, and legs, black. Lath. *Coracias ſtriata*, Gmel. *Blue-ſtriped roller*, Lath.

The length of this bird is eight inches. The female cinereous-grey and not ſtreaked like the male; quill-feathers black, edged with cinereous; irids pale red. A native of New Caledonia.

Sinensis. Green, beneath yellowiſh-green, tail cuneated, and white at the tip. Gmel. *Galgulus ſinenſis*, Briſſ. *Rolle de la Chine*, Buff. *Chineſe roller*, Lath.

Inhabits China, and is called at Canton Sau-ta-hoang. The ſize is that of a jay, the length eleven inches and a half; the bill and irids are red; head, and hind part of the neck, back, rump, and upper tail-coverts green; through the eyes on each ſide is a black ſtripe; the underparts from the chin to the vent yellowiſh-white tinged with green; wing-coverts olive-brown; quills the ſame with a mixture of cheſnut in ſome, and others tipped with white; the tail reſembles that of a magpie in form, and is marked at the tip of every feather with a white ſpot; the legs and claws are pale red, and longer than in other rollers.

Vagabunda. Head and neck black; body above ferruginous-brown, beneath cinereous; middle of the wing white; tail very long, wedge-formed, greyiſh with the tip black. Lath. *Grey-tailed roller*, Lath.

This is a native of India; the length is ſeventeen inches; its bill black; legs cinereous; leſſer wing-coverts ruſty brown; greater and ſecondary quill-feathers white, the primary ones black.

Cayana. Tawny-green; beneath dirty white; eyelids white; chin with a black ſtreak each ſide; tail cuneated. Gmel. *Grivert, ou rolle de Cayenne*, Buff. *Cayenne roller*, Lath.

Inhabits Cayenne, and meaſures about nine inches in length, the bill is reddiſh; legs long and grey.

Docilis. White interſperſed with reddiſh; beneath cheſnut; legs pale yellow; tail-feathers black with the tips white. Gmel. *Docile roller*.

Size of a blackbird, and inhabits the ſouthern parts of Aſia. The bill is yellow; the nine firſt quill-feathers white as far as the middle and from thence black, the reſt entirely black; claws fleſh colour.

Nigra. Body and limbs entirely black; tail long. Gmel. *Black roller*, Lath.

Length ſixteen inches; bill thick, and with the legs black; tail ſeven inches. Native country unknown.

Afra. Teſtaceous red; beneath reddiſh-purple; vent blue-green; wing and tail-feathers blue, with the tips blackiſh. Gmel. *African roller*, Lath.

Length eight inches and a half; the body ſtout, bill yellow; legs brown. A native of Africa.

Melanocephala. Blue-purple; head and neck black; body beneath white; quill-feathers fuſcous; tail cuneated and white at the tip. Gmel. *Black-headed roller*, Lath.

Size of a crow, bill and legs red; nape pale grey; two middle tail-feathers blue, the reſt purpliſh, and the whole white at the tip. Inhabits China.

Strepera. Black; ſpot on the wings, vent, baſe, and tip of the tail black. Lath. *Noiſy roller*.

This is an inhabitant of Norfolk iſland in the Pacific ocean, where it occurs in vaſt numbers; it has the reputation of being a ſilly bird, and is very noiſy in the night. The length is nineteen inches, of which the bill is two inches and a half long, ſomewhat ſtraight, black, denticulate, and horn-coloured near the tip; noſtrils naked, long, and placed near the baſe of the bill. The firſt ſix quill-feathers are white at the baſe; the tail long and rounded, the larger feathers white at the baſe, the lateral ones white at the tips within. When the wings are folded they reach as far as the middle of the tail. The legs are black, the outer toe connected at the baſe to the middle one.

Varia. Black; beneath, lower part of the back, rump, and upper tail coverts white; tail black, equal, with the tips of the feathers white. Gmel. *Caſſican de la Nouvelle Guinée*, Buff. *Pied roller*, Lath.

Length about thirteen inches; the bill two inches and a half long, and of a blueiſh colour with the tip dark; legs lead colour. A native of New Guinea. This bird partakes of characters common to the oriolus, coracias, and ramphaſtos genera, and might with ſome propriety be referred to either. In the index ornithologicus it is placed with the coracias tribe.

CORACINSII, in *Ancient Geography*, a people who inhabited the northern part of the iſle of Sardinia.

CORACINUS, in *Ichthyology*, the name of a ſea-fiſh caught in the Mediterranean, and called by ſome authors *ſkiæna*, and by Aldrovand and Salvian *umbra*. It is of the colour of the common tench, but in figure more approaches to the perch: its ſcales are ſmall; its mouth not very large, but well furniſhed with teeth; and its tail is not forked, but when extended, ſeems of a roundiſh figure; the ends of the rays or nerves of the tail-fin are black, and the other fins are all black, and ſeem as if dyed with ink.

Coracinus *Braſilienſis*, the Labrus *Cromis* of Gmelin, and *Guatucupa* of Marcgrave. Found in Carolina.

CORACIUS Mons, in *Ancient Geography*, a mountain of Aſia Minor in Jonia, ſituated near the town of Colophon. Strabo.

CORACLE, a fiſhing boat of curious conſtruction uſed in Wales for time almoſt immemorial. Theſe boats afford a ſpecimen of the earlieſt Britiſh navigation, and they are uſed at this time on many of the rivers in Wales, probably without any deviation from their original form. They are made with very ſtrong baſket-work, and covered with hides, or coarſe canvas, with a thick coating of pitch. Their ſhape is oval and reſembles the ſection of a walnut-ſhell, their length is generally five feet, and their breadth ſeldom leſs than four. They contain only one perſon, who ſits preciſely in the middle, and by dextrous management maintains his juſt balance. The inſtrument with which he moves his boat is a paddle; one end of which reſts upon his ſhoulder, and the other is employed by his right hand, in making a ſtroke alternately on each ſide. The left hand is, in the mean while, employed in conducting the net, and he holds the line between his teeth. Theſe veſſels were anciently uſed, as the means of intercourſe between the inhabitants on the oppoſite banks of the rivers. They are now applied only to the purpoſe of fiſhing. So frail an invention would probably have been ſucceeded by ſomething of greater ſtrength and capacity, had not there been found a remarkable convenience in their lightneſs. The fiſherman, when his labour is finiſhed, flings his boat acroſs his back, and marches homewards under the burden of his machine and booty. There is ſcarcely a cottage in the neighbourhood of the Tivy in South Wales, or ſeveral other rivers in thoſe parts, abounding with fiſh, that has not its coracle hanging by the door. Such is the adroitneſs of thoſe who uſe them, that they are very rarely overturned on lakes or rivers; and they ſometimes even venture a little way out to ſea, when the weather is perfectly calm. Similar to theſe in their nature are the Indian canoes; though they are conſtructed of different materials and forms, and applied to different purpoſes.

CORACOBRACHIALIS, in *Myology*, a muſcle of the ſhoulder-joint, ariſing by a tendinous and fleſhy origin from the apex of the coracoid proceſs of the ſcapula, and connected for ſome extent with the ſhort head of the biceps. It paſſes downwards and backwards, to be inſerted into the inner ſide of the os humeri about the middle of the bone. The muſculo-cutaneous nerve generally penetrates the fibres of the muſcle; whence it has been called the muſculus perforatus Caſſerii. It will move the os humeri towards the ſide; it will elevate the bone, and carry it obliquely forwards acroſs the front of the cheſt. It may rotule the os humeri outwards, particularly if that bone has been previouſly turned inwards.

CORACODES, in *Ancient Geography*, a port of the W. coaſt of the iſland of Sardinia. Ptolemy.

CORACOHYOIDEUS, in *Myology*, a term applied to the omohyoideus muſcle, for which ſee Larynx.

CORACOIDES, in *Anatomy*, a ſmall ſharp proceſs of the ſcapula; ſo called from its reſembling a crow's bill.

The word comes from κοραξ, *corvus*, and ειδος, *imago*.

The coracoides is placed in the upper part of the neck, and projects over the head of the bone of the arm. It ſerves to ſtrengthen the articulation of the ſhoulder; and gives origin to one of the muſcles of the arm.

CORACOMANTES, from κοραξ, *crow*, and μαντεια, *divination*, in *Antiquity*, a kind of diviners, who made their predictions by obſerving the crows.

CORACONESUS, in *Ancient Geography*, an iſland of the Mediterranean ſea, towards the coaſts of Libya. Steph. Byz.—Alſo, a place of Peloponneſus, in Arcadia; ſituated, according to Pauſanias, where the river Ladon diſcharged itſelf into the Alpheus.

CORACORADIALIS, a name given by Winſlow to the biceps flexor cubiti. See Biceps.

CORADI, or Curadi, Ottavio, in *Biography*, a Bologneſe painter, the ſcholar of Giacomo Cavedone. His principal excellence conſiſted in the boldneſs and truth with which he copied the works of his maſter. He flouriſhed in 1630, and is ſaid by Pilkington to have died in 1643. Malvaſia, Orlandi.

CORAH, or Corah-Jenehabad, in *Geography*, a ſmall city of Hindooſtan, or capital of a province in the Dooab, or country between the rivers Ganges and Jumnah; ſubject to the nabob of Oude; 184 miles S.E. of Agra, and 67 S.S.W. of Lucknow. N. lat. 26° 10′. W. long. 80° 50′. When lord Clive aſſumed the government of Bengal, in 1765, he reſtored to Sujah Dowlah all the conqueſts that had been gained from him, except the provinces of Corah and Allahabad, which were reſerved as part of an eſtabliſhment for the emperor, or great Mogul. The Corah provinces were valued at 30 lacks. The emperor was to reſide at Allahabad, under the protection of the Engliſh, to whom, in reality, he owed all that he poſſeſſed; and a treaty offenſive and defenſive was entered into with Sujah Dowlah, nabob of Oude. The ambition of the emperor was not ſatisfied; but after about ſix years quiet reſidence at Allahabad, he put himſelf into the hands of the Mahrattas, who promiſed to ſeat him on the throne of Delhi. The immediate conſequence of this connexion was a ceſſion of the Corah provinces to the Mahrattas, who, unleſs the Engliſh had interpoſed, would have eſtabliſhed themſelves in that important angle of the Dooab, which commands the navigation of the upper part of the river Ganges, and the whole courſe of the Jumnah. On this occaſion, the Britiſh government conſidered the Corah, &c. provinces, which, by right of conqueſt, were originally theirs, as having reverted to them again, when they were alienated from the purpoſes for which they had been originally granted to the emperor; and applied to the aggrandiſement of a power inimical to them and their allies. They, therefore, reſumed the poſſeſſion of theſe provinces, and immediately ceded them to the nabob of Oude, for a valuable conſideration. See OUDE.

CORAL, in *Botany*, *arbor non ſpinoſa*; Pet. Rai. See ERYTHRINA *criſta galli*.

CORAL *arbori affinis*; Sloan. See SOPHORA *occidentalis*.

CORAL *arbor americana*; Com. See ERYTHRINA *corallodendrum*.

CORAL *carolinenſis*; Dill. See ERYTHRINA *herbacea*.

CORAL *arbor polyphylla*; Sloan. See PISCIDIA *erythrina*.

CORAL, in *Zoology*, a general Engliſh name for zoophytes of the Iſis tribe, or thoſe whoſe animal reſembles a plant, and have the ſtem ſtony and articulated; with the joints longitudinally ſtriated, united by ſpongy or corneous junctures, and covered by ſoft porous cellular fleſh. About ſix ſpecies of this curious genus are at preſent known. See ISIS.

CORAL, *red*, or true red coral, was conſidered by Linnæus as an iſis, and arranged as ſuch in the Syſtema; though Linnæus himſelf acknowledged to Mr. Ellis, the author of the Natural Hiſtory of Zoophytes, that the latter had more properly claſſed it with the gorgonia, or ſea-fan, the genus iſis being ſufficiently diſtinguiſhed by its jointed ſtem. In the laſt edition of the Syſtema, the coral is placed with the ſea-fans, or gorgonia.

The red coral grows in an expanded and ſomewhat flattened form, with dichotomous branches, that leſſen towards their extremities. The fleſh is of the colour of red lead, or inclining to vermilion, ſoft, ſlippery, and full of minute veſſels. The mouths are placed on the ſurface, and riſe up in a conical form, conſiſting of eight valves, juſt opening, from whence proceed polypes of a white colour, with eight claws, each of which has a double fibre at both edges. The bone itſelf, diveſted of the fleſh, is the true coral of the ſhops, and which, in its natural ſtate, is of a ſtony texture, and of a bright red colour, with the outſide marked with minute furrows, or irregular ſtriations, interſperſed with a few ſlight depreſſions, correſponding with the ſituation of the ſhells, before the fleſh be removed. For a further account of this curious article, ſee GORGONIA *nobilis*.

CORAL, *black*. In the Linnæan ſyſtem, the true black coral is deſcribed as appertaining to the ſame genus of zoophytes as the red kind, under the ſpecific name of antipathes. This ſort is found on the ſhores of the Indian and Mediterranean ſeas, and grows in a ſhrubby form to the height of about two feet, with the branches erect, and alternately panicled. The bone is of a black colour, marked on the outſide with flexuous ſtriæ, and in its native ſtate is covered with fleſh of a grey colour. See GORGONIA *antipathes*.

The gorgonia antipathes, or true black coral, muſt not be confounded, from the ſimilarity of names, with the antipathes genus, the latter being very diſtinct, although its ſpecies are not unfrequently denominated black corals, as well as the gorgonia before-mentioned. There is a great affinity between the antipathes and gorgonia genera; notwithſtanding which they may be readily diſtinguiſhed, the bony part of the antipathes being beſet with ſmall ſpines, and covered with gelatinous fleſh, and numerous polype-bearing tubercles, while the bone of the gorgonia is ſmooth, or deſtitute of ſpines, and the fleſh cellular.

From the old botanical writers it appears, that many of the zoophytes were conſidered as genuine plants; and that in particular ſeveral ſorts of black corals were formerly called antipathes. But as the characters of theſe marine bodies are better underſtood in the preſent age, only part of theſe have been retained in the genus antipathes, and ſome of the reſt referred to the gorgonia. The antipathes of certain kinds were formerly uſed as ſceptres for princes, and likewiſe for divining rods, and other ſimilar purpoſes, as is evident from the remarks of Salmaſius, addreſſed to Solinus, wherein he ſays, that antipathes denotes ſomething proper to reſiſt incantations, and that they were in uſe for that purpoſe by ſeveral Indian nations.

There are a number of different ſpecies of this kind of black coral, which, not being ſufficiently noticed under the article antipathes, it may be proper to deſcribe in this place.

SPIRALIS. With a very ſimple, ſpiral, rough ſtem. *Antipathes ſimpliciſſima attenuata flexuoſo-ſpiralis ſpinulis ſeriatis ſcabra* of Pallas. *Gorgonia ſpiralis*, Linn. *Palmjuncus anguinus*, Rumpf.

This kind inhabits the Indian, Mediterranean, and North ſeas. It is of a hard and horny black ſubſtance, extremely brittle, and varying in length and thickneſs; one deſcribed by Mr. Ellis meaſured two feet long, and was about the thickneſs of a writing-pen; another, not thicker at the baſe than the quill of a hen's feather, was ſeven feet in length. In its natural ſtate this kind is variouſly twiſted, or generally in a ſpiral manner, and the fleſh which covers the ſpiny ſurface of the bone is full of little gelatinous warts.

ULEX. Very much branched, with ſcattered ſpreading rough and pointed branches. *Furze-like antipathes*, Soland. and Ellis.

A native of the Indian ocean. This kind is full of ſmall ſhort ſpines, the branches are looſe and irregular, and the whole remarkably black. The ſpecimen brought from Batavia, and deſcribed by Mr. Ellis, had the ſurface marked with ovate cavities, diſperſed about the branches, which were of a browniſh-yellow colour, and ſuppoſed to be the ovaries.

SUBPINNATA. Branched and pinnated, rough with ſetaceous alternate ſub-diviſions, and a few others proceeding tranſverſely from them. Soland. and Ellis.

Deſcribed by Gmelin as a native of the Mediterranean ſea on the authority of Ellis, who, however, merely informs us his ſpecimen was brought from Gibraltar, and is ſuppoſed to be taken in the ſea thereabouts. The ſpines of this kind are long and ſmall, and of an amber colour when magnified. The ſurface of the antipathes appears to be cinereous.

MYRIOPHYLLA. With numerous, incurved, pinnate branches, the ſubdiviſions with leſſer ſpinous pinnules on the upper ſide. Soland. and Ellis. *Myriophyllum indicum ramoſiſſimum*, Petiv. *Erica marina tenuis*, Rumpf.

This is called by Ellis the yarrow-leafed antipathes; it is of a beautiful ſhrub-like appearance, with many pinnated branches, bending downwards all round; the colour yellowiſhlowiſh-brown, and the ſurface rough, but conſiderably leſs ſo than the ſpecies ſubpinnata. Found near the Spice iſlands.

ALOPECUROIDES. With ſpinous, ſetaceous, cloſely panicled branches. Soland. and Ellis. *Fox-tail antipathes.*

The trunk of this ſpecies riſes from a broad ſpreading baſe, and divides immediately into ſeveral large branches, of about one-third of an inch in diameter. As they riſe up, one ſide of them appears flat, with a groove or channel along the middle of it, where there are the remains of many little branches that have grown in rows on each ſide. It then divides into branches, and often into other branches, all which are in form of cloſe panicles, not unlike the fox-tail graſs. Theſe panicles are compoſed of very rough thorny minute branches, which are twice as long on one ſide of the ſtem as the other. This riſes to the height of two feet, and is of a greyiſh colour on the outſide, the inſide black and very brittle. A rare ſpecies, diſcovered on the coaſt of South Carolina.

CUPRESSUS. Growing in the form of a ſimple rough panicle, with recurved branches. Soland. and Ellis. *Antipathes cupreſſina*, Pallas. *Gorgonia abies*, Linn. *Cupreſſus marina*, Rumpf.

The cypreſs antipathes was erroneouſly claſſed by Linnæus with the gorgonia; Gmelin places it with the antipathes. The ſpecies inhabits the Indian ocean; it is about two feet in length, and is covered with a browniſh-down, beneath which the colour is deep black.

DICHOTOMA. Very long, dichotomous, and upright. Pallas.

Inhabits the Mediterranean, is about two feet in height, round, and duſky.

ORICHALCEA. Braſſy, ſmooth, with a ſimple, rigid, flexuous ſtem, and alternate, ſcattered, dichotomous branches. Pallas. *Gorgonia ænea*, Linn.

Twelve inches in length, and very rigid. A native of the Indian ocean.

CLATHRATA. Very much branched, intricate, with confuſed ſub-diviſions in every part coaleſcing, the younger ones ſetaceous. Pallas.

Size of the laſt, and of a black colour within: this inhabits the Indian ocean.

FLABELLUM. Dilated, very ramoſe, and ſub-divided, the ſub-diviſions branching both ways, and cohering together in a reticulated manner. Pallas. *Erica marinæ affinis*, Rumpf.

This kind inhabits the Indian ſea, and is about ſix inches wide, black, rough, and undulately curved.

PENNACEA. Branched, ſomewhat incurvated, the branches with ſetaceous and very crowded rough ſub-diviſions. Pallas. *Accabaar rutturuttu*, or *Erica marina craſſa*, Rumpf. *Peucites priſma*, Aldr.

Inhabits the Indian ocean, the outſide grey and rough, within black.

ERICOIDES. Very much branched, rough and black, with ſcattered branches, covered throughout with ſubulate ſub-diviſions. Pallas. *Cupreſſus marina prior*, Rumpf.

A ſpecies about a foot high, and of a deep black colour; an inhabitant of the Indian ocean.

FOENICULACEA. Very much branched, with ſetaceous decompoſite ſub-diviſions. Pallas. *Fœnum marinum*, Rumpf.

Twelve inches high, the colour black. A native of the Mediterranean.

CORAL, *white*. See MADREPORA, MILLEPORA, and CELLEPORA.

CORAL gives title to an officinal compoſition, called *ſyrup of coral*, ſometimes preſcribed by phyſicians; as is likewiſe the powder of coral finely ground, and afterwards levigated on a marble, and made up into a proper form. But there are few, except thoſe who are fond of medicines with gems in them, that make uſe of it. By means of its exceeding hardneſs, it is ſuſpected to take away with it a great deal of the levigating ſtone.

Diſpenſary writers have given us receipts for a great many preparations of coral, as magilteries, tinctures, ſalts, &c. none of which enter the preſent practice.

Coral and coralline being the ſhells of marine animals of the polype kind, poſſeſs the ſame chemical properties as the freſh ſhells of oyſters and other ſhell fiſh, *i. e.* they are calcareous earths impregnated with ſome animal principles.

CORAL, *artificial*, is made of cinnabar well beaten; a layer whereof is applied on a piece of wood well dried, and poliſhed, firſt moiſtened with ſize: the whole is then again poliſhed; and for varniſh, rubbed over with the white of an egg. See GROTTO.

CORAL-*fiſhery*. The time for fiſhing coral is from April to July; the places are the Perſian gulf, the Red ſea, coaſts of Africa towards the baſtion of France, the iſles of Majorca and Corſica, and the coaſts of Provence and Catalonia.

The method of fiſhing is nearly the ſame in all places: that uſed at the baſtion of France, where there is an eſtabliſhed fiſhery, under the direction of a company at Marſeilles, is as follows.

Seven or eight men go in a boat, commanded by the patron or proprietor; the caſter throws his net, if we may ſo call the machine wherewith he uſes to tear up the coral from the bottom of the ſea: and the other ſix manage the boat. The net is compoſed of two beams tied acroſs, with a leaden weight to preſs them down; to the beams is faſtened a great quantity of hemp looſely twiſted round, among which they mix ſome ſtrong nets. In this condition the machine is let down into the ſea; and when the coral is pretty ſtrongly embarraſſed in the hemp and the nets, they draw it out by a rope, which they unwind according to the depth, and which ſometimes requires half a dozen boats to draw. If the rope happen to break, the fiſhermen are in great danger of drowning. They have two machines, one for fiſhing up the coral where the bottom is ſmooth; and the other, called in the Provençal language the *ſalabre*, ſo conſtructed as to be employed where the bottom of the ſea is rocky and unequal.

Before the fiſhermen go out, they agree on the price of the coral, which is ordinarily at the rate of 4*s.* 6*d. per* pound.

When the fiſhery is over, which in a ſeaſon uſually amounts to twenty-five quintals of coral each boat, it is divided into thirteen parts; the patron whereof, or maſter coraller, has four, the caſter two, and each of the ſix companions one: the thirteenth being reſerved for the company, &c.

Spallanzani has particularly deſcribed the coral-fiſhery in the ſtrait of Meſſina. (Travels in the two Sicilies, &c. vol. iv. p. 308.) This, he ſays, is both a laborious and dangerous occupation. The inſtrument, with which they force the branches of coral from the rocks, is formed with two poles of wood, croſſing each other at right angles, and having a piece of a net faſtened on the under ſide to their extremities. A large ſtone is fixed where the poles croſs each other, that the inſtrument may more readily ſink to the bottom. A cord is ſtrongly tied round the middle of it, one end of which the fiſherman holds in his hand, guiding by it the net to thoſe places where the coral is ſuppoſed to grow; and which is incloſed, in the pieces of the net, broken off, and drawn up. This fiſhery is carried on from the entrance of the Faro to the part of the ſtrait oppoſite to the church of the grotto, or through a tract ſix miles in length, and to the diſtance of three miles from Meſſina. The rocks which produce the coral are ſituated almoſt in the middle of the ſtrait, at different depths, from 350 to 650 feet. The bottom and caverns of the rocks are the places from which they endeavour to bring up the coral with their nets; and it is a conſtant obſervation, that every branch is perpendicular to the plain on which it grows, without ever turning on one ſide. Coral, it is ſaid, grows more plentifully in places ſituated to the eaſt than in thoſe to the ſouth; it is rarely found to the weſt, and never to the north. In the firſt ſituation it is larger, and of a finer colour, than in the ſecond and third; which two valuable qualities are likewiſe found in that which is brought from a leſs depth, compared with that which is grown at a greater. The greateſt height to which it grows is never a foot, and its uſual thickneſs is that of the little finger, and ſomewhat leſs than that of the coaſts of Trapani and Barbary; but the latter are exceeded by the Meſſineſe in vividneſs of colour. Theſe differences, according to the account of the fiſhermen, ariſe from their coral being produced in a ſea which is kept in continual agitation, from the ſurface to the bottom, by the current and the winds. With reſpect to colour, there are three kinds; the red, the vermilion, and the white coral. The firſt is ſubdivided into the deep crimſon-red, and the lighter red. The vermilion is extremely rare, but the white common. In the white they include the clear white and the dull white.

The coral fiſhermen have divided the whole tract in which they fiſh into ten parts. Every year they fiſh only in one of theſe parts, and do not fiſh in it again till ten years are elapſed. This interval of ten years they think neceſſary for the coral to acquire its full growth in height and conſiſtence. When they tranſgreſs this law, they find, in fact, the coral ſmaller, and of leſs conſiſtence, and the intenſity of the colour is always in proportion to the number of years they have deſiſted from fiſhing. When the ten years have elapſed, they believe that the coral no more increaſes in height, but only in thickneſs, which, however, has its limits. In fact, they have obſerved that the coral fiſhed up near San Stefano, a place where none had been ſought for in the memory of man, though it was of a very bright colour, was not higher than the ordinary coral, though it exceeded it by one-third in thickneſs.

The number of ſhips which uſually go together in this fiſhery is eighteen or twenty, each of which is uſually managed by eight men. The quantity of coral procured may amount every year to twelve Sicilian quintals. The quintal, as is well known, contains two hundred and fifty pounds, and the pound twelve ounces. The gain acquired is therefore adequate to the labour; yet may the fiſhery be conſidered as a ſecondary occupation, ſince the fiſhermen only follow it when they have no other employment by which they can make a greater profit. Spallanzani examined the branches of coral, as they were taken out of the nets, by putting them into glaſs veſſels filled with ſea-water. It is well known that, in this caſe, the white polypi will come out of their cells in the coral as ſoon as the water is perfectly at reſt. He examined and re-examined theſe polypi, as it was the firſt time he had ſeen them; but he diſcovered nothing which can make any addition to the accurate obſervations of Peyſſonel, Juſſieu, Guettard, Donati, and the very recent remarks of the celebrated Cavolini, which ſeem to leave nothing to be deſired to complete our knowledge of theſe animalcula, and their natural habitudes. Having made ſome additions and corrections to the obſervations of count Marſigli, relative to this ſubject, he proceeds to deſcribe the principal of thoſe branches, which now make a valuable addition to the claſs of Zoophyta in the imperial muſeum at Paris. He obſerves, 1. That the bark of this branch has the colour of ſealing wax; but the ſolid coral is purple, with ſome tranſparency at the extremity of the branches.

2. The bark in colour reſembles that of the foregoing; but the included ſolid coral is of a leſs vivid red.

3. The bark is of a blueiſh grey; the ſolid coral grey, with a ſlightly reddiſh tinge.

4. In this ſpecimen four branches ſhoot from the ſame ſtem; two of a pale red in the bark, and a whitiſh red in the ſolid coral. In the fourth the bark is of a whitiſh colour, and the ſolid coral ſtill whiter.

5. Three branches joining in one, the colour of which, both in the bark and the ſolid coral, is a milky white.

With reſpect to the ſtructure of the cortical and ſolid parts of the white corals, he obſerves that they are the orifices of the cells in the bark of the white coral, which being octoradiated like thoſe in the red, appears to be a proof that the polypi in both are of the ſame ſtructure, and conſequently of the ſame ſpecies; the polypi inhabiting the red coral having likewiſe eight tentacula. That coral is ſoft in the ſea, but hardens when it comes in contact with the air, was the opinion of the ancients; but has been proved falſe by the obſervations of the moderns. The coral-fiſhermen of Meſſina, who derive all their knowledge from experience only, are convinced this opinion is erroneous; but they aſſert that coral which has not attained maturity has not that degree of conſiſtence it acquires when it has arrived at its full growth. The truth of this poſition Spallanzani was not able to aſcertain, as, for that purpoſe, it would have been neceſſary to caſt the net in one of thoſe ten parts of the ſtrait in which it is prohibited by the law to fiſh till the expiration of the ten years preſcribed. Yet the rules of analogy derived from what is obſerved in all animals and vegetables, incline him to favour this opinion. It is agreed however by the fiſhermen on the coaſts of Barbary, and alſo by thoſe of Meſſina, Sardinia, and Corſica, that the deeper they deſcend into the ſea, the ſmaller is the coral. Donati obſerves, that the broken and detached branches of coral will continue to live and multiply in the ſea; and this Spallanzani allows to be the caſe, provided they meet with a firm point of ſupport to which they can attach themſelves with their viſcous humour. Otherwiſe, if they fall on the moveable ſand, they become the ſport of the waves, and he has no doubt but they muſt periſh. The fiſhermen, with whom Spallanzani converſed, appeared to be well acquainted with the true generation of coral; as they told him that they had frequently obſerved, on hard matters drawn from the bottom of the ſea, the firſt principles of coral beginning to germinate; which they deſcribe as having the appearance of a red ſpot, with a button or bud implanted in thoſe matters, ſometimes tender and fragile, and ſometimes hardened, and of the colour and nature of ordinary coral.

They were likewiſe acquainted with thoſe branches of coral which, when fiſhed up, are ſometimes found perforated by lithophagous worms, and which are mentioned by Vitaliani and Marſigli. Their nets had frequently brought them up, either from the bottom of the ſea, from caverns, or the ſides of rocks; and theſe perforated corals were found ſometimes broken in the trunk, where the perforations are moſt frequent; and at other times attached to ſome body which ſerved them as a baſe. They were of opinion that theſe corals were thus perforated, becauſe they were dry; and this dryneſs, they imagine, proceeds either from age, or their having been broken from their root by ſome fiſh, or by a part of a rock falling on them; or poſſibly by the coral nets, which do not always bring up all the branches of coral they tear away from their roots.

CORAL *iſlands*, in *Geography*, called by the Spaniards in their old charts *los corales*, or *iſles del coral*, three iſlands lying in the form of a triangle and ſituated S.W. of the Ladrones, in the Eaſt Indian ocean.

CORAL *river*, a river of New Mexico which runs a W. by S. courſe and diſcharges itſelf into the head of the gulf of California, near the mouth of the Collerado river.

CORAL-*tree*, in *Botany*. See ERYTHRIMA CORALLODENDRUM.

CORAL-*wort*. See DENTARIA BULBIFERA.

CORALARIA, *parvifolia*; Rumph. See ADENANTHERA PAVONINA.

CORALIS, in *Ancient Geography*, a marſh of Aſia, in Lycaonia, placed by Strabo in the vicinity of Galatia.

CORALIUS, a river of Greece, in Bœotia.

CORALLA, a place of Aſia, in Cappadocia, on the Euxine ſea, according to Arrian's Periplus.

CORALLI, a people of European Sarmatia, who inhabited the banks of the Euxine ſea, towards the Danube.

CORALLINA, in *Zoology*, a genus of zoophytes, the animal of which is of a plant-like form, with the ſtem fixed, and the branches ſubdivided, calcareous, and moſtly jointed.

The ancient naturaliſts miſtook corallines for a particular tribe of plants, and accordingly introduced them into their works under the title of marine moſſes. Tournefort enumerates thirty-ſix ſpecies among his plants; and indeed certain kinds appear to be ſo nearly allied to the lichen family, that ſome continental botaniſts, even in the preſent day, are in doubt where to draw the exact limit between the cryptogamia and the corallina.

All the corallines adhere to rocks or other ſolid bodies, and are concretions formed by the polype animals which inhabit them, the coralline itſelf being only the habitation of theſe creatures. The branches are commonly elevated, of a ſhrub-like form, and exhibit an elegant appearance from the ſymmetry and general proportions of their reſpective articulations; the branches being compoſed of little joints, like beads ſtrung in a necklace. The joints conſiſt of a calcareous and gelatinous matter, and have the ſurface perforated, or full of minute pores, which in many ſpecies are ſo very ſmall as to be viſible only with the aid of glaſſes. It is in theſe minute cells that the polypes reſide, and through which they either protrude their limbs when they lie in wait for food; or draw their nouriſhment through the aperture. When a branch of coralline is immerſed in vinegar the calcareous cruſt diſſolves, and leaves the cartilaginous parts uninjured, and by that means enables us to examine its internal tubular ſtructure. In point of colour the corallines differ very conſiderably, not only in different, but alſo in the ſame ſpecies, and without exception the whole become white on expoſure to air.

The coralline tribe, poſſeſſing much elegance and beauty, are highly ornamental in a collection of natural hiſtory; one ſpecies only appears to be appropriated to an uſeful purpoſe, which is the corallina officinalis, vaſt quantities of which are gathered and employed in medicine as an abſorbent.

Among the older writers the word coralline had a very general acceptation, and ſeems to have comprehended every deſcription of polype-bearing ſubſtances, in addition to the coralline genus of modern naturaliſts, ſuch as the *tubipora, ſertularia, cellepora, fluſtra, alcyonium, ſpongia*, &c. Mr. Ellis, in his publications on corallines, adheres rather too cloſely to this idea, but ſtill defines the ſeveral genera with ſo much accuracy as to render his works of the greateſt value to future naturaliſts. His veſiculated, tubular, celliferous, and articulated corallines are referable to the different genera above-mentioned (which ſee reſpectively). He includes alſo among his corallines the iſis, gorgonia, antipathes, &c. in which he is certainly wrong. The ſpecies of the true corallina at preſent known are as follow.

Species.

TRIDENS. Trichotomous, with compreſſed three-lobed flat joints. Ellis.

Found on the coaſt of the North American iſlands, where it was firſt diſcovered by Mr. John Greg.

OPUNTIA. Trichotomous, with kidney-ſhaped joints waved at the edges. Gmel. Indian fig coralline, Ellis. *Corallina latifolia*, Plunk. *Muſcus*, &c. Bocc. *Fucus*, &c. C. Bauh. *Scutellaria, opuntia marina*, J. Bauh. *Sertolaria*, Imper.

This kind grows on the coaſt of Jamaica, and other Weſt India iſlands, and is found alſo in the Mediterranean ſea. The colour is white, and the joints ſomewhat kidney-ſhaped.

MONILE. Trichotomous, with the lower joints compreſſed, convex, cuneated, oblong, and with the upper ones ſub-cylindrical. Soland. and Ellis. Necklace coralline.

Inhabits the ſhores of Jamaica.

INCRASSATA. Trichotomous, with compreſſed plano-convex wedge-ſhaped joints. Soland. and Ellis. Fleſhy coralline.

This kind is very frequently caſt up on the ſhores of the American iſlands, particularly Jamaica.

TUNA. Trichotomous, with compreſſed flat roundiſh joints. Soland. and Ellis. *Tuna coralline. Opuntia marina.* Park. Theat.

Found in the Mediterranean ſea.

NODULARIA. Trichotomous, and very much branched, with thick wedge-ſhaped joints, thoſe at the diviſions broadeſt, the terminal ones tricuſpidate or ovate. Pallas. *Nodularia alba*, Imp. *Muſcus coralloides*, C. Bauh.

Inhabits the ſame ſea as the preceding. Grows to the height of eighteen inches, and is very thick, ſtrong and white.

SQUAMATA. Trichotomous, the joints of the ſtem roundly compreſſed and wedge-ſhaped, thoſe of the branches flatly compreſſed; terminal ones flattiſh and ſharply two-edged. Ellis.

Inhabits European coaſts, and is of a ſea-green colour.

LORICATA. Trichotomous, with compreſſed, ſub-convex, wedge-ſhaped joints, angulated at the ſides; the terminal ones with ſmall obtuſe lobes. Ellis.

A native of the Mediterranean ſea.

PALMATA. Trichotomous, with compreſſed, ſub-convex, wedge-ſhaped joints, ſlightly denticulated at the tip; the extreme joints broad, and often furniſhed with ſhort finger-like lobes. Ellis.

This was found in the American ſeas, and is of a gloſſy white colour.

ELONGATA. Trichotomous, with the joints of the ſtem roundiſh and cuneated; thoſe of the branches cylindrical; the extreme joints a little obtuſe, and ſome of them capitated. Ellis.

Varies in colour from red to purple. It inhabits the European coaſts.

SUBULATA. Trichotomous, with the joints of the ſtem cuneated and two-edged, and projecting ſmall pointed branches from the top of each of their ſides, with round joints. Ellis.

The appearance of this coralline is very flat, white, ſlender, and ſmall, and ſeems as if it were very cloſely pennated or beſet with fine white fibres, projecting out on each ſide like the plume of a feather. This is the moſt delicate of the coralline tribe. Found in the Weſt Indies.

GRANIFERA. Trichotomous, with the joints of the ſtem compreſſed and wedge-ſhaped; thoſe of the branches roundiſh, and furniſhed with oppoſite ovate ovaries, ſeated on ſmall pedicles. Ellis.

This differs from all the other kinds of trichotomous corallines, in having proliferous ovaries, or branches growing out of them, being other ovaries. It is of a fine ſlender texture, and of a ſea-green colour. It was found on the coaſt of Africa, in the Mediterranean ſea.

OFFICINALIS. Sub-bipinnate, and uſually trichotomous, with the joints of the ſtem ſomewhat cuneated or turbinated; thoſe of the branches round, and ſome of the terminal ones capitated. Ellis. *Corallina officinalis, ſub-bipinnata, articulis ſulturbinatis,* Linn. Fn. Suec. *Corallina altera,* Tobernaem herb. *Muſcus corallinus filicinus,* Barrel.

Common on almoſt every ſhore, where it grows on the rocks in tufts of two, three, or four inches in length, and varying conſiderably in colour, being red, yellow, green, and white. This is the coralline of the ſhops, and is the kind uſed in powder as an abſorbent.

PINNATA. With pinnated branches without joints, and covered with a mealy ſubſtance. Ellis.

Found on the coaſt of the Bahama iſlands.

RUBENS. Dichotomous, filiform, with the joints of the ſtem round; thoſe ſupporting the diviſions clavated, and ſome of the lower ones bicornuted. Ellis. *Corallina rubens,* Linn. *Corallina filiformis dichotoma faſtigiata, articulis omnibus cylindricis,* Pallas.

Inhabits European ſeas; length two inches; colour red.

CRISTATA. Dichotomous, filiform, in creſted cluſters, with roundiſh joints; thoſe ſupporting the laſt ſub-diviſions clavated. Pallas.

This kind inhabits the European and American ſeas. The colour, as in officinalis, varies from red to purple, green, yellow, and white.

FRAGILISSIMA. Dichotomous, with ſmooth, even, cylindrical joints; thoſe at the extremity broadeſt at the tip. Linn. *Corallina minimum capillaceum,* Sloane.

This is found in the Weſt Indian and Mediterranean ſeas, and is ſo extremely fragile, that perfect ſpecimens are very rarely obtained; the colour is milk-white; length about two inches.

SPERMOPHOROS. Dichotomous, filiform, with roundiſh branches; thoſe ſupportingthe two laſt ſub-diviſions clavate. Linn., &c.

Inhabits European ſeas, is of a milk-white colour, and about an inch in length.

CORNICULATA. Dichotomous, with the joints of the ſtem and branches bicornuted; thoſe of the ſubdiviſions roundiſh. Linn.

Inhabits the ſame ſeas as the preceding.

FRUTICULOSA. Dichotomous, with round branches tapering towards the extremities, without joints, and mealy. Ellis and Soland.

There are many varieties of this ſhrub-like coralline; the ſpecies occurs on the coaſt of the Bahama iſles.

INDURATA. Dichotomous, with ſmooth round ſpreading branches, ſcarcely jointed. Ellis and Soland.

Found on the ſame ſhores as the preceding ſpecies.

LICHENOIDES. Dichotomous, with the branches a little rugged and not jointed, the tips dilated and flattened. Ellis. Liver-wort coralline.

This coralline is of a ſea-green colour; it inhabits the Bahama iſlands.

RUGOSA. Dichotomous, with cylindrical branches, hardly jointed, rough, with tranſverſe wrinkles, and compreſſed at the tips. Ellis and Soland. *Fucus Marinus,* &c. Sloane.

Found on the coaſt of Jamaica.

MARGINATA. Dichotomous, with ſcarcely jointed ſmooth flat branches, and raiſed margin. Ellis.

This kind occurred on the ſhore of one of the Bahama iſlands. Mr. Ellis obſerves, that though this coralline is found, when dry, on the ſhore, more flat than the reſt of this kind, it is very probable, when it is freſh taken out of the ſea, it is much rounder, the fibres in the inſide being extremely delicate, which occaſions its ſhrinking very much, when the gelatinous fluid is evaporated.

CYLINDRICA. Dichotomous, with cylindrical and nearly equal ſmooth joints. Ellis.

Mr. Ellis received this ſpecies of coralline preſerved in ſpirits, from the Weſt Indies, and obſerved by that means the internal parts appeared full of a clear gelatinous ſubſtance. Upon opening ſome of the joints, a number of minutely branched tubes were alſo diſcloſed, and hence this writer concludes, that the tubular-hollow appearance deſcribed by authors, proceeds from their having diſſected only dried ſpecimens.

OBTUSATA. Dichotomous, with oval-oblong joints, a little compreſſed and rounded at the ends. Ellis.

Inhabits the ſhores of the Bahama iſlands.

OBLONGATA. Dichotomous, with oblong cylindrical joints, a little compreſſed. Ellis

A ſpecies allied to the two foregoing corallines, and found on the ſhores of the ſame iſlands.

LAPIDESCENS. Dichotomous, with cylindrical downy branches. Ellis.

This kind is ſometimes found trichotomous, or three-branched, inſtead of two. In ſpecimens juſt received from the ſea, the ſurface appears covered with ſhort hair-like verticillate down, of a reddiſh colour, diſpoſed in regular circles, one above another.

BARBATA. Dichotomous, with ſhort cylindrical joints; thoſe at the extremity bearded at the tips. Linn.

Inhabits the ſhores of Jamaica, and meaſures about three inches in length. This is the bearded, or bead-coralline, of Ellis

ROSARIUM. Dichotomous, with round bead-like joints, thoſe of the ſtem longeſt and cylindrical. Ellis. Roſary coralline.

Nearly allied to the laſt, but ſpecifically different. A native of the Weſt Indies.

CUSPIDATA. Branches often dividing into four parts, and ending in ſharp points; joints cylindrical, and united by a glutinous tendinous ſubſtance. Ellis.

Found in the Weſt Indies; it is very brittle, white, and grows in tufts about three inches high.

TRIBULUS. Branches often dividing into five; joints two-edged, and united by a glutinous tendinous ſubſtance. Ellis.

A Weſt Indian ſpecies, of a whitiſh colour, and rather larger than the laſt.

FLABELLUM. Stem ſimple, incruſted, with the branches ſticking together, in a foliaceous fan-ſhaped manner, and ſomewhat waved. Ellis.

This coralline is alſo found in the Weſt Indies, and varies much in figure, being ſometimes of a flat kidney-ſhaped form, of about an inch in height, and ſometimes expanding to a large ſubdivided, lobed, and undulated maſs, from one to five inches broad, and as many in height. At the bottom of the ſtalk is a tuft of fine hair-like tubes. There are many kinds of this curious coralline found in the Weſt Indies, which vary in colour from a greeniſh-brown to a milk white.

CONGLUTINATA. Stem ſingle, ſlightly incruſted, with the branches dichotomous, and agglutinated together, and forming a naked fan-ſhaped leaf. Ellis.

Found on the coaſt of the Bahama iſlands; the colour ſea-green, and the height an inch and a half.

PHOENIX. Stem ſingle, incruſted, terminating in an oblong frond, compoſed of diſtinct faſciculated branches, produced on all ſides, the ſub-diviſions of which are united together, and appear quite flat. Ellis.

This is the palm coralline of Ellis, a ſingular ſpecies found on the coaſt of the Bahama iſlands; it is of a milk white colour, and about three inches and a half high.

PENCILLUS. Stem ſingle, incruſted, terminated by an orbicular tuft of dichotomous, filiform, jointed ramifications. Linn. Pencil coralline. Ellis.

This coralline varies in the thickneſs of its branches, as well as in ſize, being found from one to four inches long. In ſome the ſtem is very ſhort, in others four times the length of the head. The joints are eaſily diſtinguiſhed where the branches divide; the ſtem is compoſed of tubular filaments covered with calcareous cruſt; its general colour is white. This ſort of coralline adheres to ſhells by the baſe of its filaments, and is often found attached to ſuch bodies, in large cluſters, in the Weſt Indian ocean.

PENICULUM. Stem ſingle, incruſted, and terminated by an orbicular tuft of dichotomous, filiform, jointed ramifications. Ellis, &c. Mop coralline.

This is one of the moſt ſingular of the coralline genus, and differs from the reſt, among other particulars, in having the ſtem regularly wrinkled. The ſtem is ſmall at the baſe, and grows wider as it riſes, till it ſends forth its branches at the top; it adheres at the baſe like the ſertulariæ, by means of ramoſe tubes, which tubes do not leſſen as they extend or branch out, but have an equal diameter throughout their whole length. The ſpecies is found in cluſters in the American ſeas, particularly near the Bahama iſlands.

We muſt laſtly mention the corallina tereſtris of Linnæus, a ſpecies, according to that writer, diſtinguiſhed by having the branches placed oppoſite, and the joints cylindrical, with lateral peduncled, and tranſverſely wrinkled fructifications; it is further added, that the ſpecies is a few lines high, and inhabits heaths in Frieſland. Gmelin admits it as a ſpecies of coralline, with ſome doubt, and ſeems uncertain whether to conſider it of the animal or vegetable kingdom, and undoubtedly not without reaſon, for it has been deſcribed by different writers, both as a plant and a coralline. Meeſe defines it to be a vegetable of the cryptogamia claſs "Lichen fruticuloſus ramoſus articulatus, articulis longis cylindricis peltis pedunculatus." But Pallas, on the contrary, inſerts it in his work on Zoophytes, as a genuine coralline. "Corallina oppoſita ramoſa articulis cylindricis, fructificationibus lateribus pedunculatis tranſverſim oblongis." Between two ſuch oppoſite authorities, it muſt be acknowledged it might be improper to form any very concluſive opinion as to the real nature of the article in queſtion. Conſidering the ſituation in which it was ſaid to be diſcovered, we ſhould ſcarcely heſitate for a moment in concluding that it muſt belong to the vegetable kingdom, but then again the decided aſſertion of Pallas would militate againſt ſuch an opinion, and the teſtimony of ſuch an intelligent naturaliſt is not unworthy of regard. It is fortunate, however, that the accurate Ellis has afforded us much ſatisfactory information on this very ſubject: the matter is not ſo completely elucidated, perhaps, as we might wiſh; but his obſervations on the article are remarkable, and deſerve to be tranſcribed. "I ſhould have taken notice, (ſays this writer) of the corallina terreſtris mentioned by Linnæus, Syſt. Nat. 1306, from other authors; but as I found it a defective ſpecimen, of ſome one of the trichotomous corallines already deſcribed, I muſt refer the reader to a full account which I have given of it, in the Philoſophical Tranſactions, vol. lvii. p. 415, wherein the abſurdity of a *marine* animal ſubſtance, growing on a heath many miles from the ſea, is, I hope, fully demonſtrated." We are hence inclined to ſuppoſe, that in the courſe of correſpondence between Mr Ellis and Linnæus, the former had obtained an opportunity of examining ſome ſpecimen of the article in queſtion, or at leaſt of aſcertaining from Linnæus himſelf, what was really meant by his corallina terreſtris, and we ſhall therefore conclude, that it could not be of the ſhrubby lichen kind, as ſome imagine, but as Mr. Ellis ſtates it, a defective or mutilated ſpecimen of the coralline tribe, and in which caſe Linnæus and others muſt have been greatly deceived as to its *habitat*; the ſpecimen might, indeed, be found on a heath at any diſtance from the ſea; but, if truly a marine production, no one can be ridiculous enough to conceive it could grow there.

The ancients have ſaid great things of the virtues of the common *coralline*. Dioſcorides preſcribes it for mitigating the pain of the gout, and for preventing ſtagnations of the humours in any part; he ſays nothing of its virtues againſt worms, which are what we alone eſteem it for. They have been given in powder from ten grains to a ſcruple or half a dram twice a day in theſe caſes, and it has been ſaid with conſiderable good effect. Geoffroy, Mat. Med. vol. ii p. 238.

Although the corallium and coralline are reckoned alkaline and abſorbent, they are neglected in the preſent practice as unneceſſary.

CORALLINUM ARCANUM. See ARCANUM.

CORALLO-ACHATES, in the *Natural Hiſtory of the Ancients*, the name of a very beautiful ſpecies of agate, found at this time in the Eaſt Indies, but not in any plenty. It is very hard, and capable of a fine poliſh; and, when wrought, is an extremely elegant ſtone.

CORALLO-DENDRON, in *Botany*. See CORAL-*tree*.

CORALLO-FUNGUS, Vaill. See CLAVARIA.

CORALLOIDE MARBLE. See MARBLE.

CORALLOIDES, in *Botany*, Tournef. See CLAVARIA.

CORALLOIDES, Cord. See DENTARIA *enneaphylla* and *bulbifera*.

Coralloides, Dill. See Lichenes *Scyphiferi* and *Fruticuloſi*.

CORALLORHIZA, Gmel. Hall. Scop. See Ophrys *corallorhiza*.

CORALLUM, in *Mineralogy*, a name given by ſome of the writers on theſe ſubjects to the common Pyrites.

CORAM, Thomas, in *Biography*, a name worthy of ſome memorial, as the founder of a new ſpecies of charity, was born about the year 1688, and introduced at an early period to the buſineſs of the ſeas. Having ſpent ſome years in the ſervice, he ſettled in the eaſtern part of the metropolis, and was frequently witneſs to diſtreſſing ſcenes of children expoſed, through the indigence or cruelty of their parents, which excited him to project the foundling hoſpital; for which he obtained a charter in 1739. This charity has been of much real benefit to ſociety; but its regulations reſpecting the children ſeem to require reviſion, as it ſhould ſeem, by ſome late publications on the ſubject, that for a child to become an inmate there, the parent muſt be prevented for a long term of years from having the ſmalleſt intercourſe with her infant, for which ſhe muſt be ſuppoſed to have a tender affection, although unable to ſupport it. Mr. Coram was highly inſtrumental in procuring a bounty upon naval ſtores imported from the colonies, and in eſtabliſhing the colonies of Georgia and Nova Scotia. He died March 29, 1751, in his 84th year, and was buried in a vault under the chapel of the Foundling Hoſpital, where an inſcription perpetuates his memory; but his good deeds will live longer than inſcriptions on braſs or marble. Biog. Brit.

Coram, in *Geography*, a poſt-town of America, in Suffolk county, Long iſland, New York. It has about 60 houſes, and lies 62 miles eaſtward of New York city, and 10 from Smithtown.

Coram *non Judice*, in *Law*, is when a cauſe is brought into a court whereof the judges have no juriſdiction.

CORAMBIS, in *Ancient Geography*, a town of Ethiopia, near Egypt.

CORANCALI, a people of India, on this ſide of the Ganges. Ptolemy.

CORANI, a people of Italy, in the country of the Volſci. Pliny gave this name to the inhabitants of Cora; and ſays, that they derived their origin from Dardanus the Trojan.

CORANITÆ, a people of Arabia Felix. Pliny.

CORANTO, a *Dance*, *Courante*, *Fr. Corrente*, *Ital.* &c. It is ſtrange that the *courant* is ſaid by ſome writers to be the *moſt ſolemn* of all dance-tunes; forgetting the *ſaraband*, and that the word is derived from *currere*, to run. See Courant.

CORAS, John de, in *Biography*, a learned French lawyer, born at Realmont in 1513. He ſtudied law at Toulouſe with ſo much ſucceſs, that he gave public lectures upon it before he attained to manhood. He was afterwards elected profeſſor of the univerſity of Toulouſe, where he taught with ſo much celebrity that he is ſaid to have had 4000 auditors at one and the ſame time. He was appointed to the chancellorſhip under the queen of Navarre; and counſellor in parliament in the reign of Hen. II. He embraced the reformed religion, and lay under the ſuſpicion of being one of the authors of the conſpiracy in 1562, to deliver Toulouſe into the power of the Calviniſts. On this account it was with difficulty that his life was ſpared. For taking part with the prince of Conde, and other alleged offences, he was apprehended in 1572, impriſoned, and at length aſſaſſinated. The works of Coras, conſiſting of interpretations of the civil law, were printed at Lyons in 1556 and 1558, in two folio volumes, Moreri.

CORASAN, in *Geography*. See Korasan.

CORASIÆ insulæ, in *Ancient Geography*, a name given by Pliny to iſlands of the Ægean ſea.

CORASIUS Mons, a mountain of Aſia in Syria, near Antioch.

CORASPHI, or Coraxi, a people of Scythia, on this ſide of Imaus. Ptolemy.

CORAX, a mountain of Greece, in Etolia, between Naupacte and Callipolis, according to Livy, Ptolemy, and Strabo. It is now a mountain near Lepanto.—Alſo, a river of Aſiatic Sarmatia.—Alſo, mountains of Aſia, between Sarmatia and the Colchide territory, forming the boundary between the countries.—Alſo, a promontory of Tauric Cherſoneſus; E. N. E. of Criu-Metopon.—Alſo, a river of Aſia *(Carvaſiday)* which took its riſe in the mountains, ran from N. to S., traverſed the country of the Abari, and diſcharged itſelf into the Euxine ſea, E. of Pytium.

Corax, in *Ichthyology*, the Trigla *hirundo* of Gmelin.

Corax, in *Ornithology*, the *raven*, a ſpecies of Corvus.

CORAYA, the name given by Buffon to the Turdus *Coraya* of Gmelin, or *barred-tail thruſh* of Latham.

CORBACH, in Latin *Corbacum*, in *Geography*, a ſmall town of Germany, in the circle of the Upper Rhine, capital of the principality of Waldeck, which is now encloſed on all ſides by the kingdom of Weſtphalia, and likely to be conſidered only as a fief of the ſame.

The town is divided into the Old and New, each of which has its church. There is an excellent gymnaſium or grammar ſchool. One of the churches is adorned with a fine marble monument, erected by the republic of Holland to the memory of prince George Frederic of Waldeck, who was a field-marſhal in the Dutch ſervice. Corbach is ſituated in N. lat. 51° 17′, forty miles ſouth of Paderborn.

CORBAN, a Scripture term, ſignifying an oblation, or offering, to God on the altar.

Corban alſo denotes a ceremony in uſe among the Mahometans, yearly performed at the foot of mount Ararat in Arabia, near Mecca. It conſiſts in ſlaying a great number of ſheep, and diſtributing them among the poor.

This feſtival occurs ſeventy days after that of Beiram, and like the latter, continues three days; and theſe two are the only feſtivals which the Mahometans of the Eaſt obſerve with great ceremony; ſo that the people do not labour during theſe three days. The Moors keep each of theſe feſtivals eight days; and the emperor of Morocco holds this feſtival out of the city, that more people may aſſemble, and he thus preſerves the cuſtom which ſubſiſts among the Moors, of praying in the open fields, before they were converted to Mahometaniſm. He leads a ſlain ſheep to his palace by a horſeman, and, if the heart palpitates when it arrives there, this is interpreted to be a good omen.

CORBASA, in *Ancient Geography*, a town of Aſia, in Carbalia, a country of Pamphylia.

CORBEIAN *MS.* in *Biblical Hiſtory*, *Codex Corbienſis*, a MS. of the New Teſtament; of which there are two; one publiſhed by Blanchini, and the other by Sabatier. Theſe two MSS. were noted 1. 2. by Grieſbach, in his preface, p. 23, 24.

CORBEAU, *Raven* or *crow*, a moveable bridge, that received at the diſtance of ſix feet, from one end of it, a round pillar of wood about 12 feet high, and three palms in diameter, fixed or erected on the prow of a veſſel with a pully at the top of it. This moveable bridge or ſtage was about 18 feet long, and 4 feet broad, and was made ſomewhat in the form of a ladder of ſtrong timbers, laid cloſe acroſs, and cramped together with iron. On each ſide lengthways of this bridge or ſtage, there was a parapet, which reached juſt above a ſoldier's knee. At the fartheſt end of this ſtage or ladder, there was a bar of iron in ſhape ſomewhat like a peſtle, but ſharpened at the bottom, or brought to a point at the lower end. And connected with the top or upper end of it, there was a ring. To the ring there was fixed a rope, by means of which, with the help of the pulley at the top of the pillar, the machine was hoiſted up, and as an enemy's veſſel approached let fall on it, ſometimes on the prow, and ſometimes on either ſide, as an opportunity preſented itſelf. The fartheſt end of the machine falling with great force, ſtruck into the deck of the enemy's veſſel, and held it faſt. In this ſituation, if the two veſſels happened to be ſide by ſide, the Romans, who firſt made uſe of ſuch means in the ſea-fight between them, commanded by Duilius, and the Carthaginians, leaped on board the enemy's veſſel from every part of the ſide of their own at once. But if the veſſels were joined only by the prows, they then went two and two abreaſt along the machine, the two foremoſt extending their ſhields or bucklers right before them to ward off the ſtrokes or blows that were aimed at them in front, whilſt thoſe that followed, reſted each of them, the boſs of his buckler upon the top of the parapet on either ſide, and thus covered both their flanks. Such were the machines employed on that occaſion by the Romans, to which they gave the name of *Corvi*, or *Corbeaux*.

Some French writers give the name of Corbeaux to the machines with long beaks extending beyond the battlements and iron-hands ſuſpended to them by chains, with which Archimedes, at the ſiege of Syracuſe, under Marcellus, raiſed the Roman veſſels erect out of the water, and then, by looſening the chains from the beaks, let them fall into the water ſometimes on one ſide, and ſometimes bottom uppermoſt. But it is evident from Polybius's account of thoſe machines, that they were quite different from the *corvi* of the Romans, which we have juſt given a deſcription of. The *corvus* was alſo very different from what theſe writers call the *corbeau a laes-courans*, the *corbeau a griffes*, the *corbeau demoliſſeur*, the *corbeau à tenailles*, and the *corbeau à faux*.

CORBEIL, in *Natural Hiſtory*, the name of a curious ſpecies of *Chama*. It is of the larger kind, and is deeply ſtriated, both longitudinally and tranſverſely; ſo that it has a ſort of reticulated ſurface, like baſket-work.

Corbeil, in Latin *Corbolium*, in *Geography*, a town of France, in the department of Seine and Oiſe, ſituated at the confluence of the rivers Seine and Juine or Eſſonne, which divides it into the Old and New Town, in N. lat. 48° 38′, twenty-four miles ſouth of Paris. It is the chief place of a diſtrict, and has a ſub-prefect and a court of juſtice. The inhabitants excel in calico-printing and the manufacturing of glue; they have alſo very good tan-yards. Between Eſſonne and Corbeil is a larger powder-mill. The diſtrict has beſides ſeveral manufactures of cotton and linen, a ſugar-houſe, a paper-mill; and in the village of Moulin Galons there is a conſiderable manufactory of large copper coppers, kettles, and all ſorts of tinned copper kitchen utenſils. The population of Corbeil itſelf is 3200; that of the canton, which contains 26 communes upon a territorial extent of 225 kiliometres, is 14,807. The diſtrict compriſes four cantons, containing together 56,567 inhabitants upon 697 kiliometres and a half. Corbeil was formerly a county.

CORBEILLES, *Fr.* Baſkets about eighteen inches high, eighteen inches wide at top, and only about nine or ten inches wide at bottom, in order to furniſh loop-holes or openings for men ſtanding behind the parapet or work, they are placed on, to fire through without being ſeen by the enemy. They may be uſed either by the beſieged, or the beſiegers, on the parapet of the body of a place, or of any of its out-works, and on all kinds of retrenchments, whether they be lines of circumvallation or countervallation, of approach or counter-approach, &c.

Corbeilles, in *Geography*, a town of France, in the department of the Loiret, and diſtrict of Montargis; eight miles N. W. of Montargis.

CORBEL, in *Architecture*, the repreſentation of a baſket, ſometimes ſeen on the heads of caryatides.

The word is alſo uſed for the vaſe, or tambour, of the Corinthian column; ſo called from its reſemblance to a baſket, or becauſe it was firſt formed on the model of a baſket.

Corbel, or *Corbil*, is alſo uſed, in *Building*, for a ſhort piece of timber placed in a wall, with its end ſticking out ſix or eight inches, as occaſion ſerves, in manner of a ſhouldering-piece. The under-part of the end, thus ſticking out, is ſometimes cut into the form of a boultin; ſometimes of an ogee, and ſometimes of a face, &c. according to the workman's fancy; the upper-ſide being plain and flat.

Theſe corbels are uſually placed for ſtrength immediately under the ſemi-girders of a platform, and ſometimes under the ends of chamber-beams: in which latter caſe they are commonly placed a foot or two below the beam, and have a piece of timber ſtanding upright cloſe to the wall from the corbel to the beam.

Corbel is alſo uſed by ſome architects for a niche, or hollow, left in walls for images, figures, or ſtatues to ſtand in.

CORBELIN, in *Geography*, a town of France, in the department of the Iſere, and diſtrict of La Tour-du-Pin; 30 miles E.S.E. of Lyons.

CORBENY, or St. Marcoul, a ſmall town of France, in the department of the Aiſne, with a priory of Benedictines, where the kings of France uſed to pray for nine days, after having been anointed at Rheims.

CORBERA, a town of Spain, in the province of Valencia; 20 miles S. of Valencia.

CORBETT, in *Architecture*, is uſed by ſome, as Harris, in his Lexicon, for corbel.

CORBEUNTOS, in *Ancient Geography*, a town of Aſia, in Galatia, aſſigned by Ptolemy to the Tectoſages.

CORBIA, a town of the iſland of Sardinia, ſituated 25 miles from Bos, according to the Itinerary of Antonine.

CORBIANA, or Corbiena, a province of Aſia, between Hyrcania and Bactriana, according to Strabo, who ſays that it was in the country of the Elymæani.

CORBIE, in Latin *Corbeia*, a ſmall town of France, in the department of the Somme, on the Somme, in N. lat. 49° 54′ 32″, one hundred miles north of Paris; it is the chief place and canton in the diſtrict of Amiens, and has 1913 inhabitants. The whole canton contains 14,626 inhabitants diſperſed in 24 communes upon an extent of 172 kiliometres and a half.

CORBIENA, in *Ancient Geography*, (*Khorrem abad*) a place of Aſia, on the banks of the Gyndes, S.S.W. of Ecbatana and N.N.W. of Suſa.

CORBIERES, in *Geography*, a town of Swiſſerland, and chief place of a bailiwick, in the canton of Friburg; 10 miles ſouth of Friburg.

Corbieres, a valley of France near the Pyrenées, celebrated on account of a victory which Charles Martel obtained over the Saracens.

CORBIGNY, or St. Leonard, in Latin *Corbiniacum*, a ſmall town of France, in the department of the Nievre, chief place of a canton in the diſtrict of Clamecy, has 2315, and the whole canton 11,221 inhabitants. The territorial extent of the latter is 307 kiliometres and a half. It is compoſed of 15 communes.

CORBILO, in *Ancient Geography*, (*Cotton*) a port of Gaul, upon the Loire. M. D'Anville places it at a little diſtance from Condivicnum or Nantes to the weſt.

CORBIO, a town of Spain belonging to the Sueſſitani.—Alſo, a town of Latium, whoſe ſituation is unknown.

CORBIVEAU, from *Corbeau*, a raven, in *Ornithology*, an African bird, deſcribed by M. F. le Vaillant, in his "Hiſtoire Naturelle des Oiſeaux d'Afrique, &c." This bird is ſimilar to the raven in the ſhape of his body, his feet, and his claws; his middle claw is united as far as the firſt articulation, by a membrane. to the inner one; and the feathers on the lower part of his beak are turned upwards, and cover his noſtrils; but he is unlike the raven in his back, in the length of his wings, and in his graduated (*etagé*) tail. He appears, ſays the writer, to occupy in part the interval between the genus of the ravens and that of the vultures; though he reſembles the former in a greater degree than the latter. He is ſimilar to the African vulture in the ſize of his wings, which when ſpread are three inches longer than his tail; in his *graduated* tail, in the form of his beak, which is compreſſed ſide-ways, convex above, crooked and rounded. Theſe particulars diſtinguiſh the corbiveau from all the ſpecies of ravens hitherto deſcribed; and this bird may be always aſcertained by the white patch on the nape of his neck, which ſtrongly contraſts with the gloſſy black that conſtitutes the reſt of his plumage; except a white mark which ſeparates the ſides of this white patch on the back of his neck, and encircles the neck. This bird has ſome reſemblance, in point of form, to birds of prey; and his manners and mode of life confirm the reſemblance. Carrion conſtitutes the chief part of his food; and theſe birds frequently aſſemble in large and noiſy crowds. The appetite for fleſh and blood leads him to kill lambs and young antelopes, and to purſue even the largeſt quadrupeds. He flies with great ſtrength, and raiſes himſelf to a great height by his long wings. He conſtructs his neſt, in October, amidſt the trees; and lays four eggs greeniſh, ſpotted with brown. The corbiveau is not a bird of paſſage, but continues the whole year in the country where he was born. The female is leſs than the male, and the black leſs gloſſy.

CORBRENÆ, in *Ancient Geography*, a people of Aſia, placed by Polybius in the vallies of Media, with the Coſſæans and other barbarous nations.

CORBRIDGE, in *Geography*, a place of England in Northumberland formerly a borough, which ſent members to parliament. In 1296 it was burned by the Scots, and in 1311 ſuffered ſeverely from the ſame invaders; 4 miles eaſt of Hexham.

CORBULO, Cn. Domitius, in *Biography*, a diſtinguiſhed commander under ſome of the Roman emperors. By Tiberius he was made ſuperintendant of the highways in Italy. His conduct in this ſituation was queſtioned by ſucceeding ſovereigns. In the year 47, he engaged in military ſervice, and had the command of an army in Lower Germany, among whom he maintained, though at the expence of his humanity, the moſt exact diſcipline. In this commiſſion he was eminently ſucceſsful over the enemies of the empire. By Nero, in 54, he was ſent into Armenia, which was invaded by the Parthians. He employed all his efforts in reſtoring the diſcipline of the legions which had been enervated by the luxury of Syria. A maxim by which his conduct was governed, was, "that an enemy might be conquered with a pick-axe," referring to the labours of entrenchment and fortification, for which the Roman armies were ſo much diſtinguiſhed. No ſeverity, either of ſeaſon or climate, prevented him from keeping his troops in the field; and in ſuffering, as well as in exertion, he was an example to his men, going conſtantly in their clothing, and with his head bare. He never pardoned a deſerter who was apprehended. His various ſucceſſes were important to the government under which he was employed, and will be related under the article Rome. After he had forced the Parthians to an accommodation, he became, on account of the glory attached to his military reputation, an object of ſuſpicion and jealouſy with Nero, who reſolved upon his death. He accordingly ſummoned him to his preſence by a letter filled with the moſt flattering expreſſions of regard. The brave ſoldier ſcorned to ſuſpect the integrity and honour of his infamous ſovereign. He prepared to attend the court, but no ſooner had he reached the port of Corinth, than he met an order to die. Reflecting for a moment upon his own want of prudence and foreſight, he exclaimed, "I have merited my fate by truſting to the profeſſions of the monſter," and inſtantly plunged his ſword through his body. This was in the year 67. He left behind him memoirs of the ſeveral wars in which he had been engaged.

CORBUT, Charles and Philip, two draftſmen and mezzotinto ſcrapers of London, by whom we have ſeveral portraits from different maſters, as well as other prints from Vandyke, Ramſey, Titian, Oſtade, Renolds, Wilſon, &c. Charles Corbut, who was the elder, flouriſhed about the year 1760. Heinecken. Strutt.

CORCANG, or Aljorjaniyah, in *Geography*, a town of Aſia, on the river Gihon.

CORCAS, or Grand-Corcas, an iſland almoſt in the form of a creſcent, N. of St. Domingo, in the windward paſſage, about ſeven leagues W. of Turk's iſland, and about twenty E. of Little Inagua, or Heneagua. N. lat. 21° 55′. W. long. 70° 55′.

CORCELET, in *Natural Hiſtory*, that part of the fly claſs which is analogous in its ſituation to the breaſt in other animals. Many have called it the breaſt in theſe alſo, but improperly; becauſe the breaſt of other animals is the place of the lungs and trachea; but theſe organs are in the fly claſs diſtributed through the whole body. The wings are affixed to this part of the fly claſs; and there are ſome diſtinctions of great conſequence, in regard to the arrangement and diſtribution of thoſe animals into genera. Reaumur's Hiſt. Inſect. tom. iv. p. 126.

CORCELLE, in *Geography*, a river of France, which runs into the Arroux near Autun.

CORCHORUS, in *Botany*, a name given by the ancients to one or more of their moſt common pot-herbs. Linn. gen. 675. Schreb. 917. Willd. 1052. Tourn. Cl. 6. gen. 9. Gært. 391. Juſſ. 290. Vent. 3. 207. (Corete. Encyc.) Claſs and order, *polyandria monogynia*. Nat. Ord. *Columniferæ*, Linn. *Tiliaceæ*, Juſſ.

Gen. Ch. *Cal.* Perianth five-leaved; leaves linear-lanceolate, acute, erect, deciduous. *Cor.* Petals five, oblong, obtuſe, narrowed towards the baſe, erect, the length of the calyx. *Stam.* Filaments numerous, capillary, ſhorter than the corolla; anthers ſmall. *Piſt.* Germ ſuperior, furrowed; ſtyle thick, very ſhort; ſtyles ſimple or bifid. *Peric.* Capſule from two to ſix-celled, from two to ſix-valved. *Seeds* numerous, angular.

Eſſ. Ch. Corolla five-petalled. Calyx five-leaved, deciduous. Capſule from two to ſix-celled, from two to ſix-valved.

Sp. 1. C. *olitorius*. Briſtly-leaved corchorus, or common Jews' mallow. Linn. Sp. Pl. 2. Mart. 1. Lam. 1. Willd. 1. Comm. Hort. tab. 12. Lam. Ill. Pl. 478. fig. 1. Gært. tab. 64. fig. 2. (C. Plinii; Bauh. Pin. 317. Lob. ic. 505. Melochia; Alp. Egypt. 45. tab. 30.) "Capſules oblong, ventricoſe; loweſt ſerratures of the leaves briſtle-ſhaped." *Root* annual. *Stem* about two feet high, cylindrical, ſmooth, even-ſurfaced, a little branched. *Leaves* alternate, ſome ſpear-ſhaped, ſome oval, ſome almoſt heart-ſhaped, ſerrated, with a briſtle-ſhaped reflexed appendage on each ſide at the baſe, on long ſlender petioles; ſtipules ſimple, red at the baſe. *Flowers* ſmall, reddiſh-yellow; peduncles a line and half long; bractes three, awl-ſhaped. *Capſules* oblong, ſomewhat cylindrical or ſpindle-ſhaped, two inches long, obſoletely pentagonal, attenuated into a beak at the tip, five-celled, five-valved; cells divided by incompleat tranſverſe partitions. *Seeds* numerous, nearly pyramidal, dark brown, fixed in a double longitudinal row to the central margin of the partitions. A native of Aſia, Africa, and America; cultivated as a pot-herb in Egypt, Syria, and other parts of the Eaſt, particularly by the Jews. It is ſaid to poſſeſs ſome medicinal qualities, and to be uſeful as an emollient, a ſweetener, and a pectoral. 2. C. *trilocularis.* Linn. Mant. 177. Mart. 2. Lam. 2. Willd. 2, Jacq. Hort. 173. (C. æſtuans; Forſk. Deſc. 101.) "Capſules triquetrous, three-celled, three-valved; angles bifid, ſcabrous; leaves oblong; loweſt ſerratures briſtle-ſhaped." *Root* annual. *Stems* a foot high, erect, cylindrical, even-ſurfaced, green. *Leaves* alternate, petioled, undulate-ſerrated; ſtipules briſtle-ſhaped, ſmall. *Flowers* yellow; peduncles nearly oppoſite to the leaves, ſhort, two-flowered; calyxes angular; petals narrow. *Capſules* linear, triangularly priſm-ſhaped, channelled at each angle, ſcabrous, obtuſe and ſimple at the tip. A native of Arabia. 3. C. *tridens.* Linn. Mant. 565. Mart. 3. Lam. 3. (C. Americanus anguſto barbato folio; Pluk. Phyt. tab. 127. fig. 4.) β. trilocularis; Burm. ind. 123. tab. 37. fig. 2. "Capſules linear, nearly cylindrical, ſcabrous; loweſt ſerratures of the leaves briſtle-ſhaped." *Stem* even-ſurfaced, green. *Leaves* lanceolate, marked with lines, undulate-ſerrated. *Capſules* terminated by the three, much diverging, bifid ſtyles. La Marck received from Sonnerat an Eaſt Indian ſpecimen, which ſeems to be C. trilocularis of Burman, and to be ſomewhat different from Plukenet's plant. Its leaves are linear-lanceolate, toothed, on ſhort petioles; its capſules grow two or three together, on very ſhort peduncles, and are terminated by three diverging points, which do not appear bifid. 4. C. *æſtuans.* Linn. Sp. Pl. 3. Mart. 4. Lam. 4. Willd. 4. Gært. tab. 64. Lam. Ill. Pl. 478. fig. 2. Jacq. Hort. 1. tab. 85. (C. americana carpini folio, fructu longiore; Tourn. 259. Triumfetta ſubvilloſa; Brown. Jam. 232. tab. 25. fig. 1.) "Capſules oblong, three-celled, three-valved, ſix-furrowed, ſix-cuſpidate; leaves heart-ſhaped; loweſt ſerratures briſtle-ſhaped." *Root* perennial. *Stem* about a foot high, cylindrical, purpliſh, with divaricating branches. *Leaves* petioled, oval-heart-ſhaped or oblong, edged with ſharp teeth, the two loweſt ſometimes, but not always, extended into a long awl-ſhaped appendage. *Flowers* yellow, ſmall, lateral, two together, on ſhort petioles. *Capſules* terminated by three widely divaricated bifid beaks; valves marked on the inſide with obſolete tranſverſe wrinkles, inſtead of partitions; furniſhed with a double, crenulate, and ſomewhat undulated dorſal wing. A native of the Weſt Indies. 5. C. *acutangulus.* Lam. 5. Willd. 5. (Lyſimachia; Pluk. Phyt. tab. 44. fig. 1.) "Capſules priſmatic-wedge-ſhaped, acutely angular, three-toothed; leaves egg-ſhaped, ſometimes with a ſingle briſtle at the baſe; petioles hiſpid." *Root* perennial. *Stem* about a foot high, cylindrical, rather ſlender, hiſpid, branched. *Leaves* alternate, on long petioles; ſtipules five or ſix lines long, narrow, briſtle-ſhaped. *Flowers* yellow, ſmall, lateral, in pairs, on ſhort peduncles; petals oblong, rather narrow; bractes three, briſtle-ſhaped, often longer than the flower. *Capſules* ſcarcely an inch long, narrowed towards the baſe, pentangular, two of the angles more acute and more prominent than the others, terminated by three bifid beaks. A native of the Eaſt Indies. 6. C. *capſularis.* Linn. Sp. Pl. 4. Mart. 5. Lam. 6, Willd. 7. Gært. tab. 179. fig. 6. Lam. Ill. Pl. 478. fig. 3. (Alcea ſine corchorus; Pluk. alm. 18. tab. 255. fig. 4. Gænia ſativa; Rumph. amb. 5. 212. tab. 78. fig. 1.) "Capſules roundiſh, depreſſed, wrinkled; loweſt ſerratures of the leaves briſtle-ſhaped." *Root* annual. *Stem* five or ſix feet high, erect, cylindrical, ſmooth, branched. *Leaves* five or ſix inches long, petioled, oval-lanceolate, toothed, thin, pale green above, glaucous underneath. *Flowers* ſmall, lateral, ſingle; calyx-leaves concave, incurved, ſhorter than the corolla; petals emarginate. *Capſules* ſhort, ſtriated, wrinkled, five-celled, five-valved, (imperfectly ten-celled, ten-valved; five larger cells fertile; five ſmaller barren, placed between the others near the circumference of the capſule; Gært.) A native of China and the Eaſt Indies. A kind of hemp is obtained from the macerated ſtems, which is much uſed in China. 7. C. *faſcicularis.* Mart. 13. Lam. 7. Willd. 6. Vahl. ſymb. 3. p. 69. (Euphraſiæ affinis; Pluk. amalth. 85. tab. 439. fig. 6.) "Capſules conoid, woolly, faſcicled, nearly ſeſſile; leaves oblong-elliptical, petioled, without briſtle-ſhaped appendages at the baſe." Lam. *Root* perennial. *Stem* one or two feet high, ſlender, cylindrical, almoſt entirely ſmooth, a little branched. *Leaves* leſs than an inch long, alternate, toothed; petioles ſomewhat villous; ſtipules ſimple, narrow-lanceolate. *Flowers* yellowiſh, ſmall, almoſt ſeſſile, lateral, in faſcicles oppoſite to the leaves. *Capſules* five or ſix lines long, erect, three-valved, ſix-celled, furrowed. A native of the Eaſt Indies. 8. C. *hirſutus.* Linn. Sp. Pl. 6. Mart. 6. Lam. 8. Willd. 10. Jacq. Amer. 165. Hort. 3. 57. Piſt. 81. tab. 157. (Guazuma; Plum. gen. 36. Burm. amer. tab. 104.) "Capſules roundiſh, woolly; leaves egg-ſhaped, obtuſe, tomentous, equally ſerrated." Linn. "Leaves elliptical, tomentous, crenate; capſules ovate-oblong, downy, umbelled." Lam. A ſhrub three feet high, or more; branches alternate, cylindrical, cloathed with a whitiſh cottony down. *Leaves* alternate, petioled, near two inches long, and one broad. *Flowers* yellow; common peduncles oppoſite to the leaves, the length of the petioles, ſolitary, cottony, ſupporting five or ſix pedicelled flowers; calyx cottony on the outſide; petals ſcarcely the length of the calyx. *Capſules* a little incurved, very woolly, obtuſe, two-celled. A native of South America. 9. C. *tomentoſus.* Thunb. Fl. Jap. 228. "Capſules oblong, woolly; leaves tomentous." Thunb. *Stem* ſhrubby, cylindrical, erect, two feet high, and more; ſmooth, purple, branched; branches alternate; at the bottom purple and ſmooth; at the top tomentous, erect, wand-like; branchlets filiform, ſpreading, tomentous. *Leaves* alternate, petioled, nerved, ſpreading; petiole very ſhort, tomentous. *Flowers* orange-coloured, axillary and terminal, generally ſolitary. *Capſules* cylindrical, woolly. A native of Japan. La Marck aſſerts that it is diſtinct from the preceding. 10. C. *hirtus.* Linn. Sp. Pl. 5. Mart. 8. Lam. 9. Willd. 13. Jacq. Hort. 3. tab. 58. (C. folio ulmi major; Plum. Sp. 7. Burm. Amer. tab. 103. fig. 2.) "Capſules oblong, hairy; ſtem hairy; leaves oblong, equally ſerrated." *Root* annual. *Stem* about two feet high, cylindrical, rather ſlender, branched. *Leaves* alternate, unequal at the baſe, on ſhort hiſpid petioles; ſtipules narrow, very hiſpid. *Flowers* yellow; peduncles and calyxes hiſpid; petals oblong, ſhorter than the calyx, obtuſe, narrowed a little towards the baſe; ſtamens yellow, the length of the petals; germ oblong, columnar, hiſpid, with whitiſh hairs directed upwards; ſtyle filiform, the length of the ſtamens; ſtigmas two, not ſpreading. *Capſule* near an inch long, two-furrowed, two-valved. *Seeds* ſmall, black. A native of the Weſt Indies, and South America. 11. C. *ſiliquoſus.* Linn. Sp. Pl. 1. Mart. 9. Lam. 10. Willd. 14. Jacq. Hort. 3. tab. 59. (C. folio ulmi minor; Plum. Sp. 7. Burm. Amer. tab. 103. fig. 1. Corchoro affinis; Sloan. Jam. 50. hiſt. 1. 145. tab. 94. fig. 1. Coreta foliis minoribus; Brown. Jam. 147.) "Capſules linear, compreſſed, two-valved; leaves lanceolate, equally ſerrated." *Root* perennial. *Stem* about two feet high, almoſt woody, erect, ſlender, cylindrical, panicled, ſomewhat pubeſcent. *Leaves* ſmaller than thoſe of the preceding ſpecies, without awl-ſhaped appendages at the baſe, on rather long petioles, which are pubeſcent on one ſide. *Flowers* yellow, lateral, peduncled, ſolitary or in pairs; germs cloathed with ſhort hairs. *Capſules* nearly ſmooth, two-valved. According to Linnæus, the ſpring flowers are without petals, tetrandrous, with a four-leaved calyx; but thoſe produced in autumn, correſpond with the generic character. A native of the Weſt Indies. 12. C. *japonicus.* Mart. 7. Lam. 11. Willd. 11. Thunb. Fl. Jap. 227. (Teito, vulgo jamma buki; Kæmpf. amæn. 844.) "Capſules round, ſmooth; leaves doubly ſerrated." *Stem* ſhrubby, two feet high or more, ſmooth; branches alternate, filiform, angular. *Leaves* ſeveral together from alternate buds, petioled, almoſt heart-ſhaped, ovate-acuminate; ſerratures acute, almoſt briſtle-ſhaped, nerved, villous, and particularly ſo on the nerves underneath. *Flowers* yellow or orange-coloured, terminal, ſolitary, on ſhort peduncles. A native of Japan, where it is cultivated on account of its beauty. There is a variety with double flowers. 13. C. *tetragonus.* Mil. Mart. 10. (C. flore flavo fructu caryophylloide; Pluk.) "Capſules quadrangular, reflexed at the points; leaves ovate-heart-ſhaped, crenate." *Stem* about two feet high, with ſmall branches. *Flowers* pale yellow, very ſmall. *Capſules* ſwelling, rough, about an inch long, flattened at the top. A native of both Indies. 14. C. *linearis.* Mil. Mart. 11. "Capſules linear, compreſſed, two-valved; leaves lanceolate, ſerrate toothed." *Stem* three feet high, with weak branches. *Leaves* about three inches long, and one broad, ſitting cloſe to the branches. *Flowers* pale yellow, very ſmall, oppoſite to the leaves, ſolitary. *Capſules* two inches long, flat, two-celled. A native of New Spain, about Carthagena. 15. C. *bifurcatus.* Mil. Mart. 12. "Capſules linear, compreſſed, with two horns at the points; leaves heart-ſhaped, ſerrated." *Stem* between three and four feet high, herbaceous, ſtrong, with upright branches. *Leaves* on long ſlender petioles, and between them many ſmaller leaves, nearly of the ſame form, ſitting cloſe to the branches. *Flowers* pale yellow, very ſmall, lateral, on ſhort peduncles. *Capſules* near three inches long, flat, ending in two horns, two-celled. A native of Jamaica; raiſed from ſeeds ſent to Miller by Dr. Houſton. 16. C. *flexuoſus.* Mart. 14. Willd. 12. Thunb. in Linn. Tranſ. 2. 335. "Leaves doubly ſerrated, cuſpidate; ſtem zig-zag." *Stem* cylindrical, rendered ſomewhat angular by the decurrent leaves, two feet high, erect, ſmooth. *Leaves* two inches long, alternate, petioled, obliquely heart-ſhaped, villous, ſpreading. *Flowers* yellow, terminal. 17. C. *ſerratus.* Mart. 15. Willd. 9. Thunb. ibid. "Leaves oblong, ſerrated, cuſpidate; branches ſmooth." *Stem* erect, ſmooth, branched; branches cylindrical, purple, erect. *Leaves* two inches long, alternate, petioled, ſpreading; ſerratures large, briſtle-ſhaped at the tip, ſlightly rough with hairs above, ſmooth underneath. 18. C. *ſcandens.* Mart. 16. Willd. 8. Thunb. ibid. "Leaves egg-ſhaped, briſtly-ſerrated, oppoſite; ſtem and branches zig-zag, climbing." *Stem* cylindrical, branched; branches oppoſite, divaricated. *Leaves* oppoſite, on ſhort petioles, rounded at the baſe, acuminate, an inch long. *Flowers* yellow, terminal, ſolitary. The laſt three ſpecies are natives of Japan.

Propagation and Culture.—All the ſpecies may be raiſed from ſeeds ſown in the ſpring in a hot-bed, protected by a glaſs frame. Soon after they come up, they ſhould be tranſplanted into a freſh hot-bed; when they are grown ſtrong, they ſhould be removed into ſeparate pots; and if gradually enured to the open air, they may be ſhaken out of the pots in June, and ſet in an open border, where they will generally flower and ripen their ſeeds. C. hirſutus muſt be kept in a bark-bed in the ſtove during winter. Miller.

CORCIA, in *Geography*, a town of the iſland of Corſica; 14 miles N.N.W. of Corte.

CORCIEUX, a ſmall town of France, in the department of the Voſges, chief place of a canton, in the diſtrict of Saint Dié, with a population of 1143 individuals; that of the canton amounts to 8351, upon 177½ kiliometres; and the number of its communes is 13.

CORCOBA, in *Ancient Geography*, a town ſituated on the ſouth coaſt of the iſland of Taprobana, according to Ptolemy.

CORCOMA, a town of Africa, in Mauritania Cæſarienſis, between Carepula and Lagrutum. Ptolemy.

CORCONIANA Mansie, a place of Sicily, on the route from Catana to Agrigentum, according to the Itinerary of Antonine.

CORCORAS, a river of Pannonia, which, according to Strabo, paſſed before Naupontus, and diſcharged itſelf into the Savus.

CORCULUM, in *Vegetable Phyſiology*, is a term uſed by Linnæus, after Cæſalpinus, for the heart, or more properly embryo, of a ſeed; alluding to its ſhape, which, in the walnut, and many other ſeeds, reſembles the animal heart in miniature. It is the moſt important and even eſſential part of a perfect ſeed, to which all the reſt are ſubſervient, being the point whence the future plant originates. In unimpregnated ſeeds it is deficient, or rather abortive; in fertile ones it is cloſely connected with the cotyledons, on which it depends for the firſt ſupplies of nutriment, and other exciting cauſes of its evolution. The corculum conſiſts of two parts: the *roſtellum*, or radicle, which, by an unerring law of nature, deſcends in order to become the root; and the *plumula*, or feather, which as regularly aſcends, and becomes the ſtem and leaves. Dr. Darwin ingeniouſly accounts for this diverſity of direction in theſe two parts, from the former being ſtimulated by moiſture, the latter by air; and preſumes that each extends itſelf accordingly where its vitality is moſt excited. Other philoſophers have explained the ſame phenomenon, far leſs happily, on mechanical principles. See Cotyledon and Embryo. S.

CORCULUS, the *little heart*, in *Natural Hiſtory*, a name given by authors to a ſmall ſpecies of *cordiformis*, or *heart-ſhell*, of a roſe colour.

CORCURA, in *Ancient Geography*, a town of Aſia, in Aſſyria. Ptolemy.

CORCYRA, (*Corfu*,) one of the Greek iſlands, ſituated in the Ionian ſea, and called, in more ancient times, Drapane, Scheria, and Phæacia. It is ſaid to have taken its name from that of a nymph, whom Neptune raviſhed in this iſland. It is about 45 miles in length, 22 in breadth, and 210 in compaſs. It was famous for the delightful gardens of king Alcinous, who courteouſly entertained Ulyſſes after his ſhipwreck. The ſouthern parts of the iſland are barren, mountainous, and ill provided with water; but the northern coaſt is very fertile in all kinds of delicious fruit, excellent wines, olives, grain, &c.; whence Homer has denominated it the fruitful Scheria. It had anciently two cities of no ſmall note, *viz.* Corcyra and Caſſiope: the former was the metropolis of the iſland, and once very powerful, as appears from Thucydides, and others; the latter is commended by Pliny and Ptolemy as a wealthy and well-built city, but Cicero calls it only a haven.

This iſland is ſaid to have been firſt inhabited by the Phæaces, whence it was called Phæacia; but afterwards the Corinthians ſent hither a numerous colony, B.C. 756. The Corcyrians were, for ſome time, maſters of the ſea. Their government was firſt monarchical; but afterwards they formed themſelves into a republic, and made a very conſiderable figure in the flouriſhing times of Greece. Herodotus informs us (lib. vii. cap. 168.) that they were very powerful by land; but he much blames them for their deceitful conduct, with reſpect to the aſſiſtance they promiſed the Greeks againſt Xerxes: for, being invited by the Athenian and Lacedæmonian ambaſſadors to join them in the common cauſe, they readily engaged to ſend powerful ſuccours, aſſuring them that they would not neglect the ſafety of Greece in ſo imminent a danger; being well apprized, that if the enemy prevailed, they would ſoon be reduced to the condition of ſlaves. The ambaſſadors departed; and the Corcyrians, fitting out a ſquadron of 60 ſhips, ſailed to the coaſt of Peloponneſus, and having anchored about Pylos and Tenarus, waited in that ſtation to ſee the event of the war, being reſolved to join the victorious party. When they heard that the Perſians were defeated at Salamis, they left their ſtation, and joined the reſt of the Greeks, pretending that they had been prevented by the Eteſian winds from doubling the cape of Malæa, and being preſent at the battle. The Corcyrians ſubmitted to Alexander, and remained ſubject to the kings of Macedon, till they were delivered by the Romans, in the reign of Perſes; from which time they enjoyed their liberty, till the reign of Veſpaſian, when they underwent the common fate of the other Greek iſlands and ſtates both in Europe and Aſia. The Corcyrian ſeditions were proverbial even among the Greeks. See CORFU.

CORCYRA *Melæna*, or *Nigra*, ſo called to diſtinguiſh it from the former, an iſland in the Adriatic ſea, on the coaſt of Illyricum. The Cnidians built a town on this iſland. In the war of Illyricum, B. C. 229, the Romans, under the conſulſhip of L. Poſtumius Alberius II. and Cn. Fulvius Centimalus, landed in the iſland, and the Corcyrians delivered up the garriſon of the Illyrians, who had taken poſſeſſion of it under the command of Demetrius of Pharos; and the whole iſland ſubmitted, conceiving that this was the only method of ſecuring themſelves for ever from the inſults of the Illyrians. Upon the concluſion of peace, it was agreed, that Corcyra, as well as ſome other places, ſhould continue in the poſſeſſion of the Romans. This iſland is now called *Curſoli.*

CORCYRIS, a town of Egypt. Steph. Byz.

CORCZYCZ, in *Geography*, a town of Poland, in the palatinate of Volhynia; 46 miles N. of Conſtantinow.

CORCZYN, or KORTSCHIN, a town of Poland, in the palatinate of Sandomirz, on the Viſtula; 48 miles W.S.W. of Sandomirz.

CORD, or CHORD, an aſſemblage of ſeveral threads of hemp, cabled or twiſted together by means of a wheel.

The word comes from χορδὴ, which properly ſignifies an inteſtine, or gut, whereof cords may be made.

CORD *of St. Francis*, a kind of rope adorned with knots, worn by the brothers of the fraternity inſtituted in honour of that ſaint.

Some, as the Cordeliers, Capuchins, Minorites, and Recolets, wear it white; others, as the Pique-puces, black. Its deſign is to commemorate the bonds wherewith Jeſus Chriſt was bound.

CORD, *the ſociety of the*, includes a great number of people beſides religious. To obtain indulgences, they are only obliged to ſay five Paters, five Ave Maries and Gloria Patris, and to wear this rope, which muſt have been firſt bleſſed by the ſuperiors of the order.

CORD *of wood*, a certain quantity of wood for burning; ſo called, becauſe formerly meaſured with a cord.

It is now meaſured, particularly in Worceſterſhire, where the ſame has been regulated by ſtatute, between two ſtakes of wood, four feet high, and eight feet apart; and is to be four feet broad and high, and eight feet long = 128 cubic feet = 4.74 cubic yards = 3.622 ſteres or cubic inches of France = 445.223 cubic links.

CORD *wood* is properly new wood; and ſuch as, when brought by water, comes aboard a veſſel; in oppoſition to that which is floated. All burning wood, not exceeding eighteen inches circumference, is deemed cord-wood.

CORD, in *Geometry*, *Muſic*, &c. See CHORD, and STRING.

CORD, *Magical*, an inſtrument in great uſe among the Laplanders, and ſuppoſed to be of great virtues among them. It is a cord or rope, with three knots tied in it. They uſe many magical rites and ceremonies in the preparing and tying of this cord; and when thus prepared, it is ſuppoſed to have power over the winds; and they will ſell, by means of it, a good wind, or at leaſt a promiſe of one, to a ſhip. If they untie only one of theſe knots, a moderate gale is to ſucceed; if two, it is to be much ſtronger; and if three, there is to be a ſtorm.

CORD, *Umbilical.* See UMBILICALIS *funiculus.*

CORD-*Wood*, in *Rural Economy*, a term applied to the ſmall ſorts of broken-up or other wood, which was formerly ſold by the cord.

CORDA, in *Ancient Geography*, a town of Albion, in the country of the Selgovæ. As this place was ſituated farther to the N.W. than the other towns of the Selgovæ, it is thought to have ſtood on the banks of Loch-Cure, out of which the river Neith ſprings.

CORDAGE, is uſed, in *general*, for all ſorts of ropes and cords, great and ſmall; and more particularly for thoſe that are uſed in the rigging and fitting out of ſmall veſſels. The word is alſo uſed for the art of preparing and manufacturing the ropes, &c. See CABLE. See alſo ROPE, and RIGGING.

The naval cordage of different ages and nations has been formed of very different materials. Thoſe of the earlier ages were probably thongs of hide or leather; the uſe of which was retained by the Caledonians in the third century, and by the nations north of the Baltic in the ninth and tenth centuries. They are even now uſed as ropes in the weſtern iſles of Scotland. Theſe were ſuperſeded in the ſouthern parts of Britain, and on the continent, at an early period, by iron chains. Accordingly we find, that in the maritime and commercial country of the Veneti, who were intimately connected with the Belgæ of Britain, iron chains were uſed for cables in the days of Cæſar. However, in the more improved countries of the ſouth, thongs of leather and chains of iron had long given place to the uſe of vegetable threads; and the art of combining them into ſtrong cords was underſtood and practiſed. In this manner the Greeks uſed the common ruſhes of their country, and the Carthaginians applied to the ſame purpoſe the ſpartium or broom of Spain. And as all the cordage of the Romans was formed of theſe materials, at their laſt deſcent on our iſland, the art of manufacturing them would neceſſarily be introduced with the Roman ſettlements among the Britons. Under the direction of the Roman artiſts, their *junci*, or ruſhes, would be wrought into cordage. Accordingly the remains of old cables and ropes are ſtill diſtinguiſhed among the Britiſh ſailors, by the name of "old junk." Moreover, the Roman ſails, which, in the days of Agricola, were compoſed of flax, were afterwards made of hemp; and our own are therefore denominated *cannabis*, or "canvas," by our preſent mariners. About the ſame period, the ſame materials were ſubſtituted for the junk of the Britiſh cordage; for the uſe of hempen ropes upon land, and of hempen nets for hunting, was very common among the Romans in the firſt century. The Indians ſtill make their cordage of the bark of cocoas, and other trees, and of ſhreds of plants. The cordage of the Britiſh navy is made of the Riga or beſt Peterſburg break hemp, and tarred with good Stockholm or Ruſſia tar.

The cordage is ſaid to be *baked*, when, having paſſed a ſtove, or other hot place, it is drained of all its moiſture. *White* cordage is that not yet pitched. *Cordage pitched in the ſtove*, is that which is paſſed through hot pitch as it comes out of the ſtove. Each quintal of cordage may take up about twenty pounds of pitch. The cordage is ſometimes pitched in the thread. For the method of making ropes and different ſorts of cordage, ſee Rope-*making*.

By 25 Geo. III. c. 56. no perſon ſhall uſe, in the manufacture of any ropes for ſhipping, (or ſell the ſame,) hemp called ſheet chucking, half clean, whale line, or other topping, cordilla, damaged hemp, or any hemp from which the ſtaple part thereof ſhall have been taken away by the manufacturer, on pain of forfeiting, for the manufacturer, ſuch rope, and treble the value of it; and for the vender, not being the manufacturer, a ſum equal to treble its value. For the better diſtinguiſhing the quality of ſuch ropes, that which is inferior to clean Peterſburg hemp ſhall be deemed *inferior* cordage, and marked accordingly, by running from one end of it to the other three-tarred mark yarns, ſpun with turn contrary to that of rope yarn, and alſo one like tarred yarn in every other rope for the uſe of ſhipping; and the maker ſhall mark or write, on a tally to be affixed on it, the word "ſtaple," or "inferior," (as the caſe ſhall be,) and alſo his name, ſigned by himſelf or his attorney, together with the name of the place where manufactured; and in default thereof, ſhall forfeit 10*s*. for every hundred-weight. And if any ſuch rope-maker ſhall wilfully or knowingly permit his name to be put to any ſuch ropes, not being of his own manufacture; or if the vender or proprietor, or any other perſon, mark upon the tally the name of any perſon, not being the manufacturer, he ſhall forfeit 20*l*. And if any perſon ſhall make any cables of any old or worn ſtuff, which ſhall contain above 7 inches in compaſs, he ſhall forfeit four times its value. Foreign-made cordage, for which no duties have been paid, belonging to a ſhip owned by any of his majeſty's ſubjects, reſident in Great Britain, or the Britiſh colonies, and entering any port in this kingdom, ſhall be duly entered on oath at the cuſtom-houſe (ſtanding and running rigging excepted); and before the ſhip be cleared inwards, the maſter ſhall pay the duties, on pain of forfeiting the cordage, and 20*s*. for every *cwt*. of it. Upon the importation of cordage, tarred or untarred, there is a duty payable of 8*s*. 6*d*. *per cwt*, and no drawback allowed upon exportation; and in the port of London there is a farther ſcavage-rate of 1*d*. *per cwt*. of 112 *lbs*. upon the importation of cable-ropes for cordage.

As to the ſtrength of ropes, or cordage, M. Reaumur takes occaſion, in the Memoirs of the Royal Academy, to conſider the queſtion, whether a rope compoſed of ſeveral twiſts, or ſtrands, interwoven, *v. gr.* ten, have more ſtrength to ſuſtain a weight, than the ten twiſts would have ſeparately, placed parallel over one another; or, which is the ſame thing, whether, if each twiſt be capable of ſuſtaining the weight of a pound, the whole cord be able to ſuſtain more than ten?

On the one hand, 1. By virtue of the twiſting, the diameter of the rope is made larger than are thoſe of the ten twiſts together; but it is apparently by its thickneſs that a rope ſuſtains a weight, or reſiſts a fracture. 2. Twiſted ſtrands have not all, as when parallel, a vertical direction with regard to the weight: ſeveral of them, and even the greateſt part, have oblique directions, and of conſequence do not bear all the ſhare of the burden they would otherwiſe bear. In effect, they are inclined planes that are only preſſed with a part of the load.

Hence it would follow, that the ſurplus of the ſtrength of the twiſts might be employed in raiſing a larger weight.

On the other hand, it is true, that, in twiſting the ſtrands, ſome are ſtretched, and others left more looſe; and the new tenſion given the former, ſerves to weaken them, and has of itſelf the effect of a weight: thus they become leſs able to ſuſtain one ſo large. Thoſe more lax, on the contrary, evade, in ſome meaſure, the action of weight: for the action is diſtributed equally on the ten ſuppoſed equal twiſts; and if ſome, by reaſon of their particular diſpoſition, receive leſs than their quota, the weight will act more forcibly on the reſt, and will break them firſt, as being more tenſe; after which, it will eaſily diſpatch the reſt, as not being in ſufficient number to oppoſe it.

This is the ſum of what can be urged for and againſt the twiſting: to decide between them, M. Reaumur had recourſe to experiment. The reſult was, that, contrary to all expectation, he ſtill found the twiſting diminiſhed the ſtrength of the rope: whence it is eaſily inferred, that it diminiſhes it the more, as the rope is the thicker. For inaſmuch as the twiſting diminiſhes; the more twiſting, the more diminution.

The reſiſtance or friction of cordage is very conſiderable; and by all means to be conſidered in calculating the power of machines. M. Amontons obſerves, in the Memoirs of the Royal Academy, that a rope is ſo much the more difficult to bend, 1. As it is ſtiffer, and more ſtretched by the weight it draws. 2. As it is thicker; and, 3. As it is to be more bent; *i. e.* as it is to be coiled, for inſtance, into a ſmaller ring.

The ſame author has thought of ways to prove, in what proportion theſe different reſiſtances increaſe: that ariſing from the ſtiffneſs or rigidity occaſioned by the weight which draws the rope, increaſes in proportion to the weight; and that ariſing from its thickneſs, in proportion to the diameter. Laſtly, That ariſing from the ſmallneſs of the gyres, or pulleys, about which it is to be wound, is indeed greater for ſmaller circumferences than large ones, but does not increaſe ſo much as in the proportion of thoſe circumferences.

On this footing, the loſs a machine ſuſtains by the cordage, being eſtimated in pounds, becomes, as it were, a new weight, to be added to that which the machine is to raiſe. This augmentation of weight will render the cords ſtill the more ſtiff; which exceſs is to be computed as before.

Thus we ſhall have ſeveral ſums ſtill decreaſing; which are to be added together, as in the article of friction; and it will be ſurpriſing to ſee what a ſum they will amount to. See Friction.

Where ropes are uſed in a machine, all the reſiſtance reſulting from their ſtiffneſs is to be put together; and all that occaſioned by the friction; which will make ſo conſiderable an augmentation to the difficulty of the motion, that a power which to raiſe a weight of 3000 pounds, by means of a fixed and moveable pulley, needed only 1500 pounds, muſt, according to M. Amontons, have 3942 pounds, on account of the frictions, and the reſiſtance of the cordage.

Cordage, *twice-laid*, is that which is made of caſt rigging, as ſhrouds, ſtays, mooring and other cables, which, if not much worn, will make good ropes for wetting the ſides of ſhips, worming and woolding for cables, ſpun-yarn for ſeizing, worming for large ſtays, ſeizing for ſtrops of blocks, ſmall cable-laid ropes for warping ſhips, rat-lines, ſcaffolding-ropes for dock-yards, &c. When the yarn of this old ſtuff is overhauled, a little thin tar ſhould be poured on it, which will make it pliable and lie better. The yarn unfit for knotting will pick into oakum for caulking.

CORDATED Leaf, in *Botany*. See Leaf.

CORDAX, in *Antiquity*, a gay ſort of dance.

CORDE, Maurice de la, in *Biography*, born at Rheims, where he attained conſiderable eminence for his claſſical and critical learning, was made doctor of the faculty of medicine, at Paris, in the year 1559. In the courſe of an harangue, before his brethren of the faculty, having cenſured with aſperity the manners of the Romiſh clergy, and ſome of their ceremonies, and ſpoken too favourably of the reformed religion, he was ſeized and thrown into priſon. This happened in the year 1569. An edict of pacification being obtained the following year, he was releaſed, and, with the reſt of the Huguenots, allowed openly to profeſs his religion. He was alſo permitted to practiſe medicine; but the College, who were firm in the Catholic religion, took from him the place of reader or lecturer. De la Corde was one of the few Huguenots who eſcaped the maſſacre, which took place on the eve of St. Bartholomew, in the year 1572; and in 1574, he obtained an order from parliament, reinſtating him in his rights in the faculty of medicine. He publiſhed, in 1574, "Hippocratis Libellus de iis quæ Virginibus accidunt," with Commentaries, 8vo. Pariſiis; and in 1584, "Hippocratis de morbis Mulierum, Interpretatio," folio. Haller Bib. Med. Eloy Dict. Hiſt.

Corde *a feu*, *Fr.* cord-match, or match of cord, fit for retaining a ſmall quantity of fire for a long time, and of furniſhing it, or being lighted up, when wanted.

CORDEAU, *Fr.* a cord made uſe of for meaſuring ground. That which engineers commonly made uſe of was divided into toiſes, feet, and inches, in order to have the exact openings or magnitudes of angles, and the lengths of lines, which they wiſhed to trace or meaſure. But as cords ſhrink in moiſt or wet weather, and lengthen in dry, this inequality of extenſion rendered the meaſures of the diviſions untrue, and not to be depended on. To guard againſt ſuch errors or miſtakes, a chain of iron-wire, not ſo liable to undergo alterations with thoſe of the weather, was introduced and made uſe of. The French ſay, *manier le cordeau, prendre le cordeau, travailler au cordeau.*

Cordeau *de campement, ou cordeau d'alignement pour le campement*, cord of the encampment, or cord of alignement for the encampment; a long line or cord, divided equally from diſtance to diſtance, and marked at the points of equal diviſions by pieces of cloth of a ſcarlet or other vivid colour, in order to be the better ſeen and perceived. It ſerves, in the firſt place, to mark and aligne, from the left wing to the right wing, the extent on the front line of the camp for each battalion, company by company; and on which line are the colours and ſtandards of the troops that occupy the camp. It then ſerves for laying or marking off, on one and the ſame right line, the bundles or bells of arms advanced in front of the aforeſaid line, about ten paces, or five toiſes, or thirty feet, and parallel thereto. The ſame operation is performed for the alignement or the tracing out of the rear of the camp. Then the tents are placed, which occupy each about three paces or nine feet, with an interval of three paces between every two of them. About ten paces, or 30 feet, from the rear of the camp is the line for the kitchens or cooking-places for the companies; and about ten paces behind them is the ground for the drums and ſuttlers. At about 20 paces from this ground are the tents of the ſubaltern officers; and from 10 paces to 20 paces behind them are thoſe of the majors and captains, and thoſe of the colonels and lieutenant-colonels.

CORDED Cross, in *Heraldry*. See Cross-*Corded*. This is a term uſed to expreſs the cordage of a bale; as for example, a bale argent, corded gules.

CORDELIER, a Franciſcan, or religious of the order of St. Francis.

The Cordeliers are clothed in thick grey cloth, with a little cowl, a chaperon, and cloak, of the ſame; having a girdle of rope, or cord, tied with three knots: whence the name.

The Cordeliers are otherwiſe called *Minor Friars*, their original name. The denomination Cordelier is ſaid to have been firſt given them in the war of St. Louis againſt the Infidels; wherein the *Friars Minor* having repulſed the Barabians, and that king having inquired their name, it was anſwered, they were people *cordeliez*, tied with ropes. The Cordeliers are, to a man, profeſſed Scotiſts.

CORDELIER, *Order of*, in *Heraldry*. Anne de Bretagne, after the death of her firſt huſband, Charles VIII., inſtituted this order in 1498, for widow ladies of noble families.

The badge was a Cordelier's girdle argent, and was placed round the eſcucheon of their arms. It was alſo worn round the waiſt, with the ends hanging down. This order, however, ſoon after the deceaſe of the founder, fell into diſuſe.

CORDEMOI, Gerard de, in *Biography*, a native of Paris, deſtined by his friends for the bar; the ſtudies preparatory to which he neglected for the more alluring purſuits of philoſophy. On this ſubject he wrote ſome treatiſes, that recommended him to Boſſuet, by whoſe influence he was appointed reader to the dauphin. For the inſtruction of that prince, he ſtudied with much aſſiduity the hiſtory of France, and the reſult of his labours were publiſhed in two volumes, folio, ſoon after his death, which happened in 1684. This work did not obtain from the French that praiſe which it juſtly merited. By ſome Engliſh hiſtorians it has been more worthily appreciated; as well on account of the purity of its ſtyle, as from the depth of its reſearches. M. Cordemoi was elected a member of the French academy in 1675. Beſides his Hiſtory of France, we have a 4to. volume of his works, publiſhed in 1702. In the latter part of his life, he was aſſiſted in his literary labours by his ſon Lewis, who was born in 1651, and who became ſucceſſively a licentiate of Sorbonne, and an abbot in the dioceſe of Clermont. He was a voluminous writer, chiefly on theological ſubjects; and was conſidered among the Catholics as an able advocate of their cauſe, againſt the attacks of the defenders of Proteſtantiſm. He was, however, of conſiderable ſervice to his father, in the latter part of his General Hiſtory of France; and, it is believed, wrote the whole of that part which extends from about the concluſion of the reign of Lewis V. to the end of the work. By order of Lewis XIV. he continued that hiſtory from the time of Hugh Capet until the year 1660, which he did not live to finiſh. He died at the age of 71, in the year 1722. Moreri.

CORDERIE, *Fr.* a rope-yard. A ſort of work-houſe or place convenient for making, both for the artillery and veſſels, cords, cables, hawſers, &c. In inland towns, the corderies are open and uncovered, and commonly on the rampart, along by the walls; and in maritime towns, or ſea-ports, where conſiderable armaments are made, they are uſually low buildings, covered, long, and narrow, conſtructed near the arſenals and magazines. Theſe laſt mentioned corderies have generally, in France, been called *Corderies Royales*, becauſe the moſt of them were built and kept up at the expence of the king.

CORDES, in *Ancient Geography*, a river of Aſia, in Meſopotamia, which, riſing in the mountains, purſued its courſe to the ſouth, and encompaſſing the town of Dara, was loſt in a gulf near it.

Cordes, Balthasar, in *Biography*, born at Antwerp, in the year 1592, belonged to the ſociety of Jeſuits in the Low Countries, and was doctor of theology at Vienna, where he attained a conſiderable ſhare of celebrity, as profeſſor of that faculty. He was a man of great learning, particularly in Greek literature. His principal works, as editor and author, were, "S. Dionyſii Areopagitæ Opera omnia, Gr. et Lat., cum Scholiis, &c." in 2 tom. fol.; "Expoſitiones Patrum Græcorum in Pſalmos," in 3 tom. fol. He died at Rome, in the year 1650.

Cordes, John de, was born at Limoges, in the year 1570, and at an early age diſcovered a conſiderable turn for literary purſuits, in which he would probably have been encouraged, but the death of his father obliged him to apply to trade. When he was about 30 years of age, a change of circumſtances enabled him to relinquiſh buſineſs, and to indulge his original propenſity. He entered himſelf with the ſociety of Jeſuits at Avignon; but a ſeries of ill health obliged him to quit their ſeminary, and to purſue his ſtudies privately. He afterwards became a canon of his native place, and a collector of rare and valuable books. He was himſelf an author and editor of conſiderable reputation; and after his death, which happened in 1642, his library was purchaſed by cardinal Mazarine. He was editor of the works of Hincmar, archbiſhop of Rheims; and of the works of George Caſſander. He tranſlated father Paul's "Hiſtory of the Differences between Pope Paul V. and the Republic of Venice;" and likewiſe Camillo Portio's "Hiſtory of the Troubles in the Kingdom of Naples, under Ferdinand I." Moreri.

Cordes, in *Geography*, a ſmall town of France, in the department of the Tarn, on the river Ceron; 12 miles N.W. of Alby. It is the chief place of a canton, in the diſtrict of Gaillac, and counts 2303 inhabitants. The canton contains 24 communes, upon 185 kiliometres, with 8019 inhabitants.

Cordes *Toulouſianes*, a town of France, in the department of the Upper Garonne; 20 miles N.W. of Thoulouſe.

CORDESHAGEN, a town of Germany, in the circle of Upper Saxony, and duchy of Pomerania; 10 miles W. of Coſlin.

CORDESSE, a town of France, in the department of the Saone and Loire, and diſtrict of Autun; 2 leagues N. of Autun.

CORDEVATO, a town of Italy, belonging to the ſtate of Venice, in the country of Friuli; 5 miles N. of Concordia.

CORDEVOL, a river of Italy, which runs into the Piavo, between Belluno and Feltri.

CORDIA, in *Botany*, (named by Plumier in honour of Euricius Cordus and his ſon Valerius, two German botaniſts of the ſixteenth century, the former author of Botanologicon, ſeu Colloquium de variis Herbis; the latter of Annotations on Dioſcorides, and of a Hiſtory of Plants in four books with figures.) Linn. Gen. 256. Schreb. 350. Willd. 396. Lam. Ill. 270. Juſſ. 128. Vent. 2. 382. (Sebeſtena; Gært. 474.) Claſs and order, *pentandria monogynia.* Nat. Ord. *Aſperifoliæ*, Linn. *Borragineæ*, Juſſ. *Sebeſtenæ*, Vent.

Gen. Ch. *Cal.* Perianth one-leafed, tubular, or bell-ſhaped, toothed or deeply divided. *Cor.* monopetalous, generally funnel-ſhaped, ſometimes campanulate or wheel-ſhaped; tube about the length of the calyx, often enlarging upwards; border erect-ſpreading; generally cut into five, ſometimes four, ſix, ſeven, or eight obtuſe diviſions. *Stam.* generally five, ſometimes four, ſix, ſeven, or eight, awl-ſhaped, inſerted into the tube; anthers oblong. *Piſt.* Germ ſuperior, roundiſh, acuminate; ſtyle twice bifid; ſtigmas obtuſe. *Peric.* Drupe globular or egg-ſhaped, growing to the calyx; nut furrowed or pitted, two or four-celled; ſome of the cells frequently abortive. *Seeds* ſolitary, egg-ſhaped, acuminate at the ſummit.

Eſſ. Ch. Style twice bifid. Drupe with two or four-celled nuts.

Sp. 1. C. *Myxa.* Aſſyrian plum. Linn. Sp. Pl. 1. Mart. 1. Poiret in Encyc. 1. Mart. 1. Myxa ſeu ſebeſten. J. Bauh. Hiſt. 1. 197. Rai. Hiſt. 1555. Sebeſtena ſilveſtris et domeſtica. C. Bauh. Pin. 446. Proſp. Alp. Egypt. 30? Cornus ſanguinea; Forſk. Egypt. arab. 33. "Leaves egg-ſhaped, ſmooth above; corymbs lateral; calyxes ten-ſtriated." *β. officinalis*; Lam. Ill. 1895. tab. 96. fig. 3. Sebeſtena officinalis; Gært. tab. 76. fig. 1. Sebeſtena domeſtica, ſeu Myxa; Comm. Hort. 1. 139. tab. 72. Blackw. tab. 398. Prunus ſebeſtena, longiore folio; Pluk. Almag. 306. tab. 217. fig. 3. Vidi-maram; Rheed. Mal. 4. 97. tab. 37. Rai. Hiſt. 1563. Burm. Flor. ind. 58. "Leaves egg-ſhaped, rather acute, unequally ſerrated above; calyx ſomewhat cylindrical, even-ſurfaced." *Leaves* like thoſe of alder, ſerrate-angular, ſcabrous underneath. Linn. A middle-ſized tree. *Trunk* thick; wood whitiſh; bark ſcaly, marked with purple lines; branches and branchlets very ſmooth and even ſurfaced, cinereous, dotted. *Leaves* alternate, petioled, large, narrowed at the baſe, enlarged, rounded, and a little acute at the ſummit, entire towards the baſe, toothed or almoſt ſlightly ſinuated on the upper part; teeth unequal, diſtant, acute or obtuſe; nerves lateral, oblique, projecting; veins reticulated; petioles ſmooth, cylindrical, little more than one-third of the length of the leaves. *Flowers* white, ſweet-ſcented, in a large, cloſe, terminal panicle, conſiſting of lateral branches with a few ſhort ramifications: calyx green, cylindrical, five-cleft; diviſions of the corolla five or ſix, open, a little reflexed. *Drupe* black, oval, acuminate, ſmooth, pulpy; nut deeply furrowed, perforated; naturally four-celled, but two of the cells generally abortive or quite obliterated. α. a native of Egypt; β. of the Eaſt Indies. Poiret aſſerts that it is not eaſy to determine what was the myxa of Linnæus, and thinks it probable that two ſpecies have been confounded, but though the African and the Eaſt Indian plants differ a little in habit, and in the form of their leaves, he has, for the preſent, conſidered them only as varieties. A more accurate knowledge of their flowers and fruit will be neceſſary before they can be pronounced to be abſolutely diſtinct. The fruit has been eſteemed a valuable medicine in diſorders of the cheſt and urinary paſſages, but is now entirely out of uſe in England. The Eaſt Indians eat it macerated in ſalted vinegar, and reckon it ſerviceable in diarrhœas. An excellent glue is made of the pulp, which is more viſcid than that of the Jujube. 2. C. *lutea*. Lam. Ill. 1897. Poir. 15. "Leaves egg-ſhaped, obtuſe, crenate near the ſummit; corymbs lateral and terminal; calyxes ten-ſtriated." A ſhrub twelve or fifteen feet high; branches zig-zag, ſmooth, cinereous, pubeſcent on their upper part. *Leaves* alternate, petioled, ſcabrous on both ſides, marked on the upper ſurface with ſmall whitiſh joints, a little pubeſcent underneath when young; petioles pubeſcent, half the length of the leaves. *Flowers* yellowiſh; peduncles very ſhort; calyxes whitiſh, ſtrongly ſtriated, four-toothed, a little ſcarious at the edges; tube of the corolla the length of the calyx; border open, with ſix, ſeven, or eight diviſions; ſtamens eight; filaments erect, filiform, villous at the baſe; anthers oval, compreſſed; ſtyle the length of the ſtamens. *Drupe* whitiſh, egg-ſhaped; not terminated by a recurved point, four-celled, two of the cells frequently abortive. Found by Dombey at Huanxa and in the neighbourhood of Lima, where it is very common. La Marck enquires whether it may not be the myxa of Linnæus, excluding all the ſynonyms; but there can be no ground for the conjecture, as Linnæus certainly referred to a plant of the old continent. 3. C. *obliqua*. Willd. 2. Phyt. 1. 4. tab. 4. fig. 1. (C. myxa γ. Poir.) "Leaves roundiſh, heart-ſhaped, nerved, veined, oblique. Nearly allied to C. myxa, but the leaves are quite entire and the calyxes not ſtriated. A native of the Eaſt Indies. 4. C. *monoica*. Willd. 3. Roxb. Coromand. 1. 43. tab. 58. "Leaves roundiſh, egg-ſhaped, toothed, veined, ſcabrous; corymbs axillary, monœcious." *Leaves* three inches long or more, two inches broad, alternate, very ſcabrous, acute; petioles about one-third of the length of the leaves. *Flowers* white, ſmall, in axillary or terminal corymbs, which are ſhorter than the leaves; corolla funnel-ſhaped, with five egg-ſhaped obtuſe diviſions; ſtamens within the tube of the corolla; filaments awl-ſhaped, enlarged at the baſe, anthers lanceolate. *Drupe* yellowiſh, globular, pointed, filled with a glutinous pulp. A native of foreſts on the coaſt of Coromandel. 5. C. *ſerrata*. Juſſ. Poir. 3. "Leaves heart-ſhaped, acutely ſerrated; panicle terminal." *Branches* erect, cylindrical, ſmooth and even. *Leaves* about three inches long and two broad, alternate, petioled, egg-ſhaped, acute or ſomewhat acuminate, irregularly ſerrated, membranous, dark-green above, yellowiſh-green underneath; nerves ſimple, alternate. *Flowers* in a cloſe, ſomewhat conical, panicle, a little leafy at the baſe of its firſt branches, ſmall, white; calyx and border of the corolla five-lobed; ſtamens five. A native of the Eaſt Indies; deſcribed from a dried ſpecimen without fruit in the herbarium of Juſſieu. 6. C. *ſubcordata*. Lam. Ill. 1899. Poir. 4. (Novella nigra, ſeu talamari; Rumph. Amb. 2. 226. tab. 75?) "Leaves ſomewhat heart-ſhaped, entire, even on its upper ſurface; calyx cylindrical." A tree. *Branches* ſpreading, tufted, ſmooth. *Leaves* from four to ſix inches long or more, and nearly as many broad, alternate, ſlightly pubeſcent underneath along the principal nerves. *Flowers* in ſhort, looſe, terminal racemes, large, white with a reddiſh tinge; calyx tubular, ſmooth, three-toothed; corolla funnel-ſhaped, wrinkled or plaited; tube at leaſt twice the length of the calyx, much enlarged near the top; border with ſix or ſeven roundiſh lobes; ſtamens ſix or ſeven; anthers verſatile; ſtyle ſhorter than the ſtamens. *Drupe* the ſize of a hazel-nut, four-celled; ſome of them abortive. Diſcovered by Commerſon in the Praſlin Iſlands in the Eaſt Indies. 7. C. *collococca*. Linn. Sp. Pl. 5. Mart. 6. Poir. 5. Willd. 14. (C. chretioides; Lam. Ill. 1902? C. foliis rugoſis; Brown Jam. 167. Ceraſo affinis; Sloan. Jam. 169. hiſt. 2. 95. tab. 203. fig. 2. Ceraſa americana; Pluk. Phyt. tab. 158. fig. 1.) "Leaves oblong-ovate (cordate-ovate; ſyſt. nat.) quite entire; flowers in corymbs; calyxes tomentous on the inner ſide." A middle-ſized tree. *Trunk* divided near the top into ſpreading branches. *Leaves* alternate, petioled, acute, wrinkled. *Flowers* yellowiſh-green, in looſe ſomewhat-panicled terminal corymbs; peduncles branched, very unequal; corolla funnel-ſhaped, with five deep diviſions. *Drupes* bright red, the ſize of a ſmall cherry, with a ſweetiſh clammy pulp. A native of the Weſt Indies, where the fruit is a favourite food of turkies and other poultry. In Jamaica it is called clammy cherry, or turkey-berry tree. 8. C. *hirſuta*. Willd. 15. (C. collococca; Aub. Guian. 1. 219. tab. 86. C. nodoſa; Lam. 1905. Poir. 8.) "Leaves oblong, attenuated both ways, pubeſcent; flowers in terminal and axillary corymbs; peduncles hirſute." *Leaves* narrower than thoſe of the preceding ſpecies. *Stem* and *peduncles* hirſute. *Corymbs* denſe, ſomewhat umbelled, not dichotomous-divaricated. *Fruit* white, oblique, acuminate. A native of Cayenne and Guiana. 9. C. *tetrandra*. Lam. Ill. 1909. Poir. 11. Willd. 16. Aubl. Guian. 1. 222. tab. 87. "Leaves egg-ſhaped, ſomewhat heart-ſhaped, acute, ſcabrous underneath; corymb or cyme terminal; flowers tetrandrous." A tree forty or fifty feet high, with ſpreading branches. *Leaves* eight or ten inches long, three or four broad, alternate, entire or ſlightly undulated, nerved; petioles an inch long. *Flowers* greeniſh; common peduncle forked, dichotomous at the ſummit, and branched; calyx top-ſhaped, with four roundiſh acute lobes; corolla funnel-ſhaped; tube ſhort, border expanding, four-lobed; ſtamens four. *Drupe* whitiſh, round; nuts three or four-celled; ſomewhat oval, wrinkled, enveloped in a white gelatinous ſubſtance. A native of Cayenne and Guiana. 10. C. *tetraphylla*. Lam. Ill. 1908. Poir. 6. Willd. 18. Aubl. 1. 422. tab. 88. "Leaves four in a whorl, inverſely egg-ſhaped, quite entire; peduncles lateral, many-flowered." A ſhrub ſix or ſeven feet high, with knotty branches. *Leaves* nearly ſeſſile, firm, nerved, a little reticulated, ſmooth on both ſides. *Flowers* white, ſeſſile, on long common peduncles; calyx with five acute teeth; corolla funnel-ſhaped; tube narrowed at the baſe; border five-lobed; ſtamens longer than the corolla. *Drupe* yellowiſh, the form and ſize of an olive; not very hard, generally one-celled. A native of Guiana, on ſandy ſoil near the ſea. 11. C. *geraſcanthus*. Linn. Sp. Pl. 2. Mart. 4. Lam. 1903. tab. 96. fig. 2. Poir. 7. Jacq. Stirp. Amer. 43. tab. 175. fig. 16. Brown Jam. 170. tab. 29. fig. 3. "Leaves lanceolate-egg-ſhaped, quite entire; panicle terminal; calyxes tomentous, ten-ſtriated." A conſiderable tree. *Branches* ſpreading, cylindrical, clothed on the upper part with a thickiſh cinereous down. *Leaves* alternate, ſmooth, coriaceous, on ſhort petioles. *Flowers* rather large, white, permanent, ſhrivelling; principal branches of the panicle furniſhed at the baſe with narrow ſeſſile bractes; pedicels ſhort, unequal, three-flowered; calyx oblong, funnel-ſhaped, ſlightly toothed; corolla twice the ſize of the calyx, with four, five, or ſix almoſt oval obtuſe diviſions; filaments faſtened to the tube of the corolla, from the baſe to the middle; anthers incumbent, yellow; germ oblong, ſtriated; ſtyle ſhorter than the ſtamens; ſtigmas thick, obtuſe, yellow. A native of Jamaica, where it is eſteemed one of the beſt timber-trees. 12. C. *flaveſcens*. Poir. 9. Aubl. 1. 226. tab. 89. (C. ſarmentoſa; Lam. Ill. 1907.) "Leaves ovate-oblong, acuminate, ſmooth, quite entire; racemes lateral; drupes obtuſe." A ſhrub, producing from the roots ſeveral woody, ſarmentous ſtems, eight or nine feet long, ſpreading upon the neighbouring plants and trees. *Leaves* alternate, petioled, nerved, reticularly veined, ſix or ſeven inches long, and three broad. *Flowers* yellowiſh, in lateral racemes, on a rather long common peduncle; calyx with five or ſix deep, roundiſh, acute diviſions; corolla funnel-ſhaped; tube enlarged above the calyx; border with four or ſix round, ſpreading lobes; ſtamens five or ſix; anthers arrow-ſhaped; germ greeniſh. *Drupe* purpliſh; nut enveloped with a dry and firm membrane. *Seeds* affording a glutinous matter. A native of Cayenne and Guiana. 13. C. *ſpineſcens*. Linn. Mant. 206. Mart. 2. Lam. 1904. Poir. 10. Willd. 4. "Leaves egg-ſhaped, acute, ſerrated, ſcabrous; petioles becoming thorns." *Branches* ſtiff, erect, tomentous, ferruginous. *Leaves* alternate, tomentous underneath; petioles very ſhort, jointed, breaking off at the joint when the leaves fall, the part that remains ſharpening into a thorn, as in volkameria. *Flowers* in axillary, ſimple, or bifid racemes, equal in length to the leaf; calyx campanulate, with five obſcure teeth; corolla campanulate, five-toothed, twice the length of the calyx; ſtigmas acute. *Drupes* black, ſeſſile, about the ſize of gooſeberries. 14. C. *toqueve*. Lam. 1911. Poir. 12. Willd. 10. Aubl. Guian. 1. 228. tab. 90. "Leaves cordate-ovate, acuminate, quite entire, villous; racemes compound." A much-branched, ſpreading ſhrub, five or ſix feet high; branchlets brittle, villous, ruſſet. *Leaves* from four to ſix inches long, three or four broad, alternate, nearly ſeſſile, rough and villous above, tomentous and pale green underneath. *Flowers* white, in axillary and terminal racemes; common peduncle long, villous, leafleſs; calyx almoſt tubular, five-toothed; tube of the corolla ſhort; border ſpreading, with five roundiſh lobes; ſtamens five; filaments the length of the corolla; germ a little villous at the ſummit. *Drupe* yellowiſh, fleſhy, one-celled. A native of Guiana. 15. C. *macrophylla*. Linn. Sp. Pl. 4. Mart. 5. Lam. 1901. Poir. 13. Redouté Pict. Muſ. Par. Annals of Muſeum of Nat. Hiſt. vol. i. Annals of Botany, 1. 127. (Colococcus platyphyllus; Brown Jam. 168. Prunus racemoſa foliis maximis; Sloan. Jam. 184. Hiſt. 2. 130. tab. 221. fig. 1.) "Leaves ovate-oblong, villous, veined, very large; racemes forming a corymb; calyx cup-ſhaped." A tree from forty-five to ſixty feet high. *Trunk* never more than ſixteen inches thick; branches cylindrical, villous while young, ſeveral times two or three-forked, diverging, and declined towards the earth. *Leaves* from ſix to thirteen inches long, from three to ſeven broad, alternate, deflected, clothed with ſhort rough ſcattered hairs, entire, or edged with ſmall ſharp teeth; nerves obliquely tranſverſe, prominent underneath; petiole ſhort, cylindrical, channelled. *Flowers* white; calyx oval, villous, with five upright, ſtraight, obtuſe teeth; tube of the corolla cylindrical, entirely villous; ſegments of the border elliptical, deflected, a little curled, rounded at the tip; ſtamens five, longer than the corolla; anthers verſatile, with two cells ſeparated at the baſe, and attached to the filaments by their backs; germ oval, acute. *Drupe* red, ſpherical, about the ſize of a pea, two-celled. A native of Jamaica. 16. C. *ſebeſtena*. Linn. Sp. Pl. 3. Mart. 3. Lam. 1898. tab. 96. fig. 1. Poir. 14. Willd. 5. Bot. Mag. 794. Bot. Rep. tab. 157. (C. foliis ſubrepandis; Jacq. Amer. 42. C. nucis juglandis folio; Plum. Gen. Amer. 105. C. foliis amplioribus; Brown Jam. 202. Sebeſtena ſcabra; Dill. Elth. 341. tab. 255. fig. 331. Caryophyllus ſpurius; Sloan. Jam. 136. Hiſt. 2. 20. tab. 64. Cateſb. Car. 2. 91. tab. 91. Novella nigra; Rumph. Amb. 2. 226. tab. 75. Brown Fl. Ind. 59.) "Leaves egg-ſhaped, ſomewhat repand, ſcabrous; calyx cylindrical." A ſhrub ſeven or eight feet high. *Stems* ſeveral, erect, ſmooth, cylindrical, branched. *Leaves* alternate, on ſhort petioles, ſlightly ſerrated when young, the older ones more or leſs repand, the upper ones entire. *Flowers* deep yellow or ſcarlet, in large terminal racemes; pedicels one, two, or three-flowered; calyx with three diviſions near the top; corolla funnel-ſhaped; border with five oval, obtuſe, crenulate diviſions; ſtamens five; ſtigmas recurved. *Drupe* inverſely pear-ſhaped; nut deeply furrowed. A native of the Eaſt and Weſt Indies. It is not improbable that the above quoted ſynonyms refer to more than one ſpecies; but no botaniſt has hitherto found ſufficiently diſcriminating ſpecific characters. The Eaſt Indian plants have yellow, the Weſt Indian ſcarlet flowers. 17. C. *africana*. Lam. 1896. (C. ſebeſtena β; Poir. Willd. Sebeſtena alpini? Lam. Wanzey; Bruce's Travels, 5. 57, with a figure.) "Leaves roundiſh-oval, entire; panicle terminal; calyxes top-ſhaped; nut of the drupe triquetrous." A tree. *Trunk* dividing into four or five thick branches, about three feet and a half from the ground. *Flowers* ſnow-white, funnel-ſhaped, entire, and folded back at the margin. A native of Abyſſinia. 18. C. *aſpera*. Willd. 6. Forſt. Prod. 109. "Leaves egg-ſhaped, acuminate, rough; flowers in cymes, wrinkled." A native of the iſland of Tongatabu. 19. C. *dichotoma*. Willd. 7. Forſt. 110. "Leaves oblong-egg-ſhaped, ſcarcely crenate; corymbs dichotomous." A native of New Caledonia. 20. C. *ſalvifolia*. Poir. 16. "Leaves ovate-lanceolate, obtuſe, wrinkled, very rough, reticularly veined underneath; racemes lateral." *Branches* ſmooth, ſtriated, cinereous, or yellowiſh, ſomewhat pubeſcent when young. *Leaves* two inches long, one inch broad, alternate, very firm, coriaceous; petioles two or three lines long, ſhort, firm, rough. *Racemes* ſtiff, villous, beſet with whitiſh hairs. Native country unknown, communicated by Dupuis to Juſſieu, and preſerved in his Herbarium. 21. C. *domingenſis*. Lam. 1900. "Leaves egg-ſhaped, entire, rough, whitiſh underneath; panicle terminal; calyxes cylindrical." *Branches* dark brown, thick, angular, very rough. *Leaves* from ſix to eight inches long, four or five broad, alternate, thick, coriaceous, nerved, reticularly veined; petioles almoſt cylindrical, ſhort, thick, very rough. *Flowers* in panicled racemes, ſhorter than the leaves; racemes unequal, erect, cylindrical, ſtiff, ſcabrous, a little pubeſcent; pedicels one-flowered. A native of St. Domingo. 22. C. *lævigata*. Lam. Ill. 1912. Poir. 18. "Leaves egg-ſhaped, veined, ſhining; panicles lateral; ſtamens villous near the baſe." *Branches* ſlender, filiform, cinereous, cylindrical, knotty. *Leaves* alternate, petioled, rather ſmall, quite entire, obtuſe, or a little acute, narrowed at the baſe, coriaceous, ſmooth on both ſides, reticularly veined. *Panicles* ſhort, but longer than the leaves, ſmooth, branched; calyxes ſmooth, ſhort, ſtriated; corolla open, ſomewhat campanulate; border five-lobed. A native of the Weſt Indies. 23. C. *ſenegalenſis*. Juſſ. MSS. Poir. 19. "Flowers tetrandrous; leaves membranous, egg-ſhaped, acute, ſmooth; racemes ſhort." A tree about twenty feet high. *Branches* dark brown, ſlender, cylindrical, quite ſmooth. *Leaves* alternate, four or five inches long, about three inches broad, thin, nerved, and reticularly veined; petioles two inches long and more, ſmooth, compreſſed. *Flowers* in panicled racemes, ſcarcely longer than the petioles; pedicels very ſhort, one-flowered; calyx with three diviſions; corolla with four diviſions half way down. Brought from Senegal by Adanſon. 24. C. *exaltata.* Lam. Ill. 1910. Poir. 21. "Leaves egg-ſhaped, acute at the baſe, rough; corymb terminal; flowers quinquefid." A large tree. *Branches* ſmooth, ſtriated. *Leaves* about four inches long and two broad, alternate, quite entire, obtuſe, ſomewhat acuminate, coriaceous, almoſt ſhining; petioles very ſhort, ſtriated, ſlightly compreſſed. *Corymb* a little longer than the leaves; pedicels very ſhort, thick, one-flowered, calyx ſhort, ſmooth, campanulate, with five ſmall acute teeth. *Drupe* globular, the ſize of a pea, two-celled. A native of Guiana. 25. C. *nervoſa.* Lam. Ill. 1906. Poir. 22. "Leaves alternate and oppoſite, ovate-oblong, acuminate, nerved; panicle ſhort; bractes awl-ſhaped." A tree. *Branches* cinereous, thick, angular, rough. *Leaves* from eight to ten inches long, four or more broad, alternate, entire, ſmooth, deep green and ſhining above, pale yellow underneath; nerves ſtrong, oblique, parallel, a little branched or confluent towards the edges of the leaf; petioles very ſhort, thick, knotty at the baſe. Firſt diviſions of the panicle almoſt dichotomous; branches ſhort, thick, almoſt woody, ſmooth: calyxes ſmooth, with five ſhort oval diviſions. A native of Guiana. 26. C. *rotundifolia.* Poir. 23. Ruiz. and Pav. Flor. Peruv. 2. 24. tab. 148. Prunus Sebeſtena; Pluk. Almag. 306. Phytog. tab. 217. fig. 2. "Leaves roundiſh and oval, crenate, ſcabrous; peduncles corymbo-dichotomous." A ſhrub about twelve feet high. *Stems* ſtraight, often almoſt procumbent, cylindrical; branches numerous, very long, ſupple, zig-zag, villous when young. *Leaves* from two to three inches long, and two broad, alternate, petioled, wrinkled, veined, rough, rather hiſpid. *Flowers* yellow, large; calyx tubular, ſtriated, with five ſhort acute teeth; corolla funnel-ſhaped; tube the length of the calyx, dilated at the orifice; border with five plaited, oval, acute diviſions; filaments awl-ſhaped, villous at the baſe; anthers oval-oblong, concave; germ oval, acuminate; ſtyle the length of the ſtamens. *Drupe* whitiſh, half enveloped by the calyx and a viſcid pulp; nut oval, acuminate, five-furrowed, two-celled. The fructification often varies from ſix to eight in the number of its parts. A native of Peru, in dry ſandy ground, and by the ſides of the roads. 27. C. *dentata.* Poir. 24. "Leaves egg-ſhaped, angularly-cut, toothed; panicle dichotomous, large, divaricated, branches petioled, hirſute." *Branches* a little zig-zag, brown or cinereous, cylindrical, rough, cloathed with ſhort ſtiff whitiſh hairs. *Leaves* from three to five inches long, from two to four broad, alternate, rough with ſmall whitiſh points and deep green above, paler and yellowiſh underneath; ſome ſcarcely toothed, others moderately cut, a little angular, with ſhort acute teeth; nerved and reticularly veined; petioles about an inch long, ſlender, cylindrical, villous. *Flowers* white, almoſt campanulate; panicle terminal; ramifications numerous, growing gradually ſhorter, ſtiff, pubeſcent: pedicels very ſhort, one-flowered; calyx ſhort, almoſt campanulate; tube of the corolla ſhort, dilated at the orifice; border large, very open, with five or ſix very ſhort lobes. A native of Curaçao. 28. C. *micranthus.* Mart. 11. Poir. 25. Willd. 12. Swartz. Prod. 47. Flor. Ind. Occid. 1. 460. "Leaves elliptical, acute, entire, membranous, veined; racemes compound, looſe." *Branches* cinereous, a little twiſted, wrinkled, ſmooth. *Leaves* alternate, coriaceous, quite entire, deep green and almoſt ſhining above, paler underneath, obtuſe or ſomewhat acuminate; petioles ſhort, ſtriated. *Flowers* very ſmall; calyx very ſhort, ſmooth, ſtriated. A native of Jamaica on woody mountains. 29. C. *ſinenſis.* Lam. 1914. Poir. 26. "Leaves oblong, obtuſe, villous at the axils of the nerves; panicles ſhorter than the leaves." *Branches* ſlender, filiform, ſmooth, ſomewhat ſtriated, cylindrical, ſlightly compreſſed near the ſummit. *Leaves* two or three inches long, half an inch broad, alternate, quite entire, a little narrowed at the baſe; petioles filiform, leſs than an inch long, ſmooth. *Flowers* whitiſh, in lateral and terminal panicles; calyx whitiſh green, ſhort, open, campanulate after the time of flowering, ſmooth, four or five-lobed, obtuſe at its orifice; corolla funnel-ſhaped, lobed, about twice the length of the calyx. *Drupe* ſmall, oval, nut two-celled. A native of China. 30. C. *indica.* Lam. Ill. 1913. Poir. 27. "Leaves egg-ſhaped, petioled, naked; flowers panicled; tube of the corolla entirely concealed in the calyx." *Branches* ſmooth, cylindrical, long. *Leaves* from one to four inches long, from one to two broad, alternate, quite entire, obtuſe or ſomewhat obtuſe, membranous, ſmooth, nerved and reticularly veined; petioles an inch and half long, ſlender, ſupple. *Flowers* in long lateral and terminal branched panicles; branches alternate, terminated by ſmall penduious racemes; pedicels ſhort, unequal; calyx whitiſh, campanulate, ſmooth, lobed and appearing gnawed at the edge, very open after the time of flowering; corolla ſmall; border ſhort, open. *Drupes* ſmall, oval, two-celled. A native of the Eaſt Indies; diſcovered by Sonnerat. 31. C. *elliptica.* Mart. 12. Poir. 28. Willd. 12. Swartz. Prod. 47. Flor. Ind. Occid. 1. 461. "Leaves oblong, attenuated at the tip, entire, ſomewhat coriaceous; racemes compound, diffuſe; drupes acuminate." A large tree with ſpreading branches. *Leaves* alternate, ſmooth on both ſides, ſhining, nerved and veined; petioles ſemi-cylindrical, channelled underneath, ſmooth. *Flowers* white, in terminal racemes, almoſt ſeſſile, unilateral; calyx coriaceous, elliptical, tubular, ſmooth, from two to five-cleft; tube of the corolla enlarged at its baſe, ſcarcely longer than the calyx; border with five linear, lanceolate, reflexed diviſions; filaments bearded; anthers oblong, inclining, glandular at the ſummit; germ oblong; ſtyle cylindrical. *Drupe* about ſix lines long, ſupported by the enlarged very open calyx; nut wrinkled. A native of Jamaica and St. Domingo. 32. C. *patagonula.* Mart. 7. Willd. 17. Hort. Kew. 1. 259. (Patagonula americana; Linn. Sp. Pl. Lam. Ill. 271. Pl. 96. Poir. Dill. Elth. 306. tab. 226. fig. 293.) "Leaves oblong-lanceolate, ſmooth on both ſurfaces; upper part ſerrated; branchlets hairy." A ſhrub, with the habit partly of privet and partly of alaternus. *Stem* ſtraight, cinereous, ſpotted with white; ends of the branches covered with long hairs. *Leaves* alternate, obtuſe or acute, entire and narrowed into a petiole at the baſe. *Flowers* in a kind of terminal corymb; calyx very ſmall, but much enlarged after the time of flowering, with five deep diviſions; corolla wheel-ſhaped: tube very ſhort; border flat, with five oval acute diviſions; filaments five, as long as the corolla; anthers ſimple; germ oval, acute; ſtyle permanent, the length of the ſtamens. *Fruit* an oval, acuminate capſule? A native of Patagonia.

This ſpecies, we believe, was firſt referred to cordia by Mr. Dryander in Hortus Kewenſis. Linnæus made it a ſeparate genus, partly on account of the enlargement of the calyx during the ripening of the fruit; but this is a circumſtance common to other ſpecies of cordia; and partly on account of the fruit which appears to be a capſule; it is, however, not ſufficiently known, and Juſſieu doubts whether it be really a capſule.

Cordia *retuſa;* Vahl. Mart. See Ehretia *buxifolia.*

Cordia, in *Gardening*, comprifes plants of the flowering ſhrubby exotic kind: of which the ſpecies moſtly cultivated is the ſebeſten or rough leaved cordia. (C. *ſebeſtena.*) See the preceding article. It is of a beautiful ſcarlet colour, making a fine appearance. A ſmall piece of the wood thrown on a pan of lighted coals perfumes the whole houſe with a moſt agreeable ſmell. It is ſaid to be from the juice of the leaves combined with that of the fruit of a ſpecies of fig, that the fine red colour with which they dye their cloths in Otaheite is manufactured.

Method of Culture. This is a plant which is raiſed by ſowing ſeeds obtained from the Weſt Indies as ſoon as poſſible after they arrive, in pots of light earth, plunging them in a common hot bed or bark bed, and when the plants have two or three months' growth pricking them out ſingly in ſmall pots, replunging them in the hot bed, to forward their rooting afreſh; being afterwards conſtantly continued in the ſtove or hot houſe. They require frequent watering in the ſummer ſeaſon.

Theſe are plants which are very ornamental in ſtove collections, where they can only be kept.

CORDIAL. See Cardiac.

Cordial *waters.* See *Compound* Waters.

CORDIERI, Niccolo, in *Biography*, called likewiſe by the Italians Il Franciofino, becauſe a native of France, was born in Loraine in the year 1567. He came to Rome in his childhood, and applied himſelf with unremitting aſſiduity to the ſtudy of deſign and modelling, as well from the fineſt remains of ancient art, as from the life. He ſoon became a ſculptor of conſiderable ability and eminence, inſomuch that he was more than once honoured by the viſits of the pontiffs Clement VIII. and Paul V. while at work. Amongſt his principal performances, which are enumerated by Baglione, are four large ſtatues in a chapel at Santa Maria Maggiore, repreſenting David, Aaron, St. Bernardo, and St. Athanaſius. This artiſt died at Rome in the year 1612, and was buried at the church of the Trinita del Monte. Baglione.

CORDIERS, Fr. rope-makers. There is an immenſe number of them employed in France for the uſe of the artillery. But there was a certain claſs of them who enjoyed barracks under part of the fortification of the arſenal on the river Seine and had the privilege of working there, under the walls of the arſenal, on condition of being always in readineſs to furniſh cordage for the artillery.

CORDILLERAS, in *Geography*. See Andes.

CORDON, in *Fortification*, is a row or layer of ſtones, rounded on the outſide towards the ditch, and placed between the termination or upper part of the ſlope of the wall or revetement, and that part of it, which is on the outſide of the parapet and ſtands perpendicularly. The cordon ſerves to prevent this difference between the lower and upper part of the revetement, from being offenſive to the eye, and is at the ſame time ornamental.

The cordon of the revetement of the rampart is often on a level with the terre-plain of the rampart. Certain writers are of opinion, that it might be placed to more advantage ſome feet lower, particularly when there is a wall in front of the parapet, and a ſpace between them for going the rounds and ſhielding them from the enemy's fire.

Cordon, in *Military Operations* and *Hiſtory*, is a chain of poſts, or an imaginary line of ſeparation, between two armies either in the field or in winter-quarters, or for covering a particular frontier or tract of country.

Cordon, in *Geography*, a ſmall iſland in the Pacific ocean, near the weſt coaſt of Nicaragua, at the entrance of the bay of Realejo.

Cordon-Jaune; the order of, or of the yellow ſtring, in France, was inſtituted by the Duke de Nevers in 1606, and aboliſhed the ſame year by Henry IV. of France.

Cordon, in *Ornithology*, a name given by Buffon to the Ampelis *cotinga* of Gmelin, and the purple-breaſted chatterer of Pennant and Latham.

CORDONA, or Cardona, in *Geography*, a mountain of Valentia in Spain, is compoſed entirely of rock-ſalt, 4 or 500 feet high and about 3 miles in circumference: Mr. Bowles informs us, that there are no traces of gypſum near this mountain, as in moſt ſimilar inſtances is the caſe. In the climate of Spain, this maſs of ſalt remains undiſſolved by the rains, or the waters of a river which waſhes it. Mr. Townſend carried a fragment of this ſalt with him through Spain, without the leaſt ſign of deliqueſcence, but on his return to England he ſoon found it ſurrounded by a pool of water, owing to the coldneſs and humidity of our atmoſphere. In Spain this rock-ſalt, like the fluorſpars of Derbyſhire, is employed to make ſnuff-boxes, vaſes, and other ornaments and trinkets.

CORDOVA, Adriano *of*, in *Biography*, ſo called from the place of his nativity, a conſiderable town in Spain, was a barefooted Carmelite who applied himſelf to hiſtorical painting with ſucceſs. It is regretted, however, that from a too great modeſty or diffidence of his own powers, he was induced to deface ſo many of his pictures as ſoon as he had finiſhed them. The few that remain are at Cordova, the moſt remarkable of which is a Crucifixion with St. John, Mary Magdalene, and other figures of half length, in the manner of Rafaele Sadelen, in the convent of the Carmelites. This artiſt died at Cordova in the year 1630. Cumberland.

Cordova, or *Cordoua*, in *Geography*, a city of Andaluſia in Spain, forming a kind of ſemi-circular amphitheatre on the right bank of the Guadalquivir, in an extenſive and fertile plain at the foot of that ridge of mountains, named the Sierra Morena, 84 miles N.E. of Seville; 112 N. of Malaga; 210. S.W. of Madrid, in N. lat. 37° 40′. It is the ancient *Corduba*, the firſt Roman colony in Spain, and probably on that account called *Colonia Patricia*, or ſimply *Patricia*, as appears from an inſcription on an antique marble in the church of St. Marina:

D. M. S.
M. Lucretius. Verna Patricienſis. Ann. LV.
Pius in Suos. H. E. S.
Sit T. T. Levis.

Cordova has been ſtyled the mother of men of genius. From the very foundation of this city it was the ſeat of learning and ſciences. Strabo ſays, that the ancient books of the Turdetani, their poetry, and their laws written in verſe, were preſerved at Cordova. Its academy was celebrated for rhetoric and philoſophy; it had alſo a Greek profeſſorſhip. The elder Seneca, and Lucius Annæus Seneca, preceptor to Nero, were born at Cordova, as well as Lucan the poet, whoſe grandfather Acilius Lucanus, celebrated for his eloquence, ſtudied here. So did Gallio, another famous orator; Portius Ladro, of whoſe works there remains one harangue; and Manelus, maſter of the elder Seneca. Tully, in his oration for the poet Archias, mentions ſeveral poets of Cordova who were eſtabliſhed at Rome among others, Sextilius Henna, of whoſe writings there is only one elegy extant, in which he laments the death of the Roman orator.

After the fall of the Roman empire, Cordova was ſubject to the dominion of the Goths, until the Gothic monarchy of Spain was overthrown by the Saracens, under the command of Tarik. A Roman captive and proſelyte who had been enfranchiſed by the caliph of Damaſcus, aſſaulted Cordova with ſeven hundred horſe. He ſurpriſed the town, and drove the Chriſtians into the great church, where they defended themſelves above three months; and of all the Spaniſh military chiefs the governor of Cordova is recorded as the only one, who fell, without conditions, a priſoner into the hands of the Saracens.

Abdelaziz, the ſon of Muſa, to whom the adminiſtration of Spain, under the caliph of Damaſcus, was confided, conceived the deſign of erecting an independent throne at Cordova; but no ſooner was a ſuſpicion of his intentions diffuſed than a powerful conſpiracy was formed againſt him. As he was repairing alone to the moſque of Cordova, he was attacked and murdered by the conſpirators.

On the aſſaſſination of Abdelaziz, Ayub aſſumed the adminiſtration of Spain. He was ſoon removed by the ſuperior favour or merit of Alahor, who, like Abderame one of his ſucceſſors, vainly attempted the conqueſt of the weſt.

Under twenty ſucceſſive lieutenants of the caliphs, Spain imbibed, in a few generations, the manners of the Arabs; and by aſſuming the name of Spaniards, the Arabs aſſerted their original claim of conqueſt.

In the mean time the rival houſes of Ommijah and of Abbas, the uncle of Mahomet, convulſed the eaſt by their pretenſions, from the Indus to the Euphrates. Their conteſt was decided on the banks of the Zeb. Mervan XIV., and laſt caliph of the houſe of Ommijah, was forced to yield to the enthuſiaſm of the Abbaſſides, conducted by Abdallah the uncle of his competitor. The vanquiſhed caliph croſſed the Euphrates, and without halting in Paleſtine, pitched his laſt camp on the banks of the Nile, where he was attacked by Abdallah, and the lance of an Abbaſſide terminated the reign and life of Mervan.

In the proſcription of the Ommiades, a royal youth of the name of Abdalrahman alone eſcaped from the rage of his enemies, and was received on the coaſt of Andaluſia with open arms. The Arabian chiefs, who reverenced the memory of the immediate ſucceſſors of Mahomet, drew their ſabres in his ſupport. The defeat of the Zeb was avenged on the banks of the Guadalquivir; that river was ſwelled with the bodies of the ſlaughtered Abbaſſides; and the throne of the victorious Abdalrahman was eſtabliſhed at Cordova in the year 755 of our era.

During a proſperous reign of thirty years, Abdalrahman I. encouraged agriculture, commerce, and the arts. Cordova became the centre of induſtry, of politeneſs, and of genius. His ſon Haſſam, who ſucceeded him, not only patronized, but was even a proficient in the arts. He finiſhed the famous moſque, which had been begun by his father, and threw over the Guadalquivir a bridge which remains a laſting monument of his ſkill.

Under the ſecond Abdalrahman a perpetual ſupply of pure water was conducted through pipes and aqueducts into the heart of Cordova, and numerous moſques augmented its magnificence.

Learning flouriſhed under Alkaham the ſecond. He founded the univerſity of Cordova, and the birth-place of the Senecas, and the Lucans, aſſerted again its pretenſions to literary fame. He collected ſo immenſe a quantity of manuſcripts, that before the end of his reign the royal library is reported to have contained the almoſt incredible number of ſix hundred thouſand volumes, of which the catalogue alone filled forty-four.

But the pomp of the third Abdalrahman, who reigned from the year 912 till 961, appears ſtill more incredible. His wives, concubines, and black eunuchs, amounted to ſix thouſand three hundred perſons. He was attended to the field by a guard of twelve thouſand horſe, whoſe belts and ſcimitars were ſtudded with gold. To perpetuate the name of his favourite Sultana, he conſtructed, three miles from Cordova, the palace and gardens of Zehra or Arizapha. The edifice was ſupported by above a thouſand columns of the fineſt marble; the walls of the hall of audience were incruſted with gold and pearls. A formidable army ſecured the proſperity which his dominions derived from his wiſe adminiſtration. The royal city of Cordova contained ſix hundred moſques, nine hundred baths, and two hundred thouſand houſes. Eighty large cities, three hundred towns, and twelve thouſand villages obeyed his ſway, and yet, in leſs than fifty years after his deceaſe, the kingdom of Cordova was diſſolved, and the houſe of Ommijah overwhelmed.

His ſon, Alkaham the ſecond, whom we have already mentioned as the founder of the univerſity of Cordova, died in 976, and left the throne to Haſſem his ſon, a feeble infant, and the reins of adminiſtration to the celebrated vizir Mahomet Abenamir, who from his valour acquired the ſurname of Almanzor or the Defender. He ſucceſsfully ſtruggled againſt civil and foreign commotion, and at his death, his renown was reſpected in his deſcendants. The office of vizir became hereditary in his family. His ſons ruled with a power as abſolute as that of the caliphs; their inſolence provoked the ambition of other chiefs; the excluſive pretenſions of the houſe of Ommijah were diſregarded, the grandſon of the great Abdalrahman was plunged into a dungeon, and the glory of the throne of Cordova, which under the Ommiades had ſhone with ſuch a luſtre, during a little more than two centuries, was overſhadowed by a long night. The limits of the Saracen dominions gradually receded. Several petty principalities were formed on the ruins of their empire, which was at length confined within the boundaries of Grenada.

In the mean time the univerſity of Cordova preſerved for a long period of years the reputation which it had acquired under Alkaham II. It was at Cordova that Avempace and Algazel, two ſages mentioned by St. Thomas, taught moral philoſophy; that Alial Cohacen and Aliebcn Rezel acquired their profound erudition; and that Abenzuel, the great aſtrologer and phyſician, ſurnamed the Wiſe, received his education. Within its walls were formed thoſe thirty philoſophers and phyſicians, who arranged the works which, under the name of Avicenna, were dedicated to prince Garalai, to whom they have been falſely attributed.

Among the learned Moors, to whom Cordova gave birth, are Albermarcar, Abramo, Meſulco, Raſhez Almanzor, known by a number of curious works, and a hiſtory of the conqueſt of Spain, Aben Regid who likewiſe wrote on the diviſion and conqueſt of Spain, and Averröes, called, by way of eminence, the commentator.

Cordova has preſerved nothing of its ancient grandeur, except a vaſt encloſure filled with houſes half in ruins. Its population from 300,000, which it was in the time of the Moors, is reduced to 15,000. Its long, narrow, and ill-paved.

paved ſtreets are almoſt deſerted; moſt of the houſes are uninhabited; and the multitude of churches and convents which it contains, are beſieged by a crowd of vagabonds covered with rags. Although the art of ſoftening leather and giving a brilliant poliſh to its ſurface was invented here, Cordova has but a few tan-yards. Its induſtry is confined to ſome manufactures of woollen cloth, ribbands, laces, and hats. Rents and proviſions are low; and the value of eſtates has fallen one half in the courſe of the century.

The biſhop of Cordova is ſuffragan of the archbiſhop of Seville. His annual income exceeds 3000*l.* ſterling. St. Raphael, the patron of Cordova, has a magnificent gilt ſtatue at one of the gates, which forms a ſingular contraſt with the wretchedneſs that reigns within the town.

The only remarkable edifice of Cordova is its famous cathedral, which formerly ſerved as a moſque to the Moors, and ſtill retains the name of Mezquita. It forms a long ſquare of one hundred and fifty-eight paces by one hundred and thirty-eight, and is well lighted, but too low. About ſix hundred columns of blackiſh marble placed in Quincunx are well preſerved; but they do not reach the ceiling; they are ſcarcely more than ten or twelve feet high, and have neither baſe nor capital; they are joined to each other by two arches placed one above the other, covered with plaiſter, and ſupported with ſtone work whitened over. The reſult of the whole is not altogether agreeable to the eye, and the cathedral is more remarkable for its oddity than for any very ſtriking beauties, though nothing would equal its magnificence were the height proportioned to the extent. Its exterior preſents only a maſſy and irregular edifice with enormous ſquare pillars.

By the ſide of the cathedral is a ſmall grove, the faſcinating remains of the taſteful luxury of the Moors. It is planted with orange-trees, the tufted foliage of which ſerves as an aſylum to great numbers of birds, and hangs over ſeveral fountains which conſtantly cool the air.

The ancient palace of the Moors has been converted into ſtables, in which one hundred ſtallions are uſually kept. Their genealogy is carefully preſerved; the name and age of each are written over the ſtall in which he ſtands. The beautiful horſe of Cordova is reckoned the moſt perfect. There is a curious manuſcript in the Eſcurial marked D.CCC.XCVII on horſes and horſemanſhip, written by a Mooriſh general, and dedicated to the third king of the race of Benneſſaret, who reigned in the year 1301.

The country round Cordova abounds in oranges and lemons, and produces excellent wine. Gibbon's Rome. J. Talbot Dillon's Travels through Spain, ſecond edit. 4to. London, 1782. Bourgoing's Tableau de l'Eſpagne. Peyron's Eſſays on Spain. F. A. Fiſcher's Travels in Spain, in 1797 and 1798.

Archbiſhop Roderic Ximenes, in his "Hiſtoria Arabum," informs us, that Cordova was paved ſo early as the middle of the ninth century, or about the year 850, by Abdalrahman II. the 4th Spaniſh caliph. This prince, who knew the value of the arts and ſciences, and who favoured trade ſo much, that in his reign abundance prevailed throughout the whole land, cauſed water to be conveyed into this city, which was then his capital, by leaden pipes, and ornamented it with a moſque, and other elegant buildings.

CORDOVA, a province of South America, being, by the new diviſion of 1782, an intendency of the viceroyalty of Buenos Ayres, about 100 leagues in length, and 70 in breadth, interſected by ſeveral chains of mountains, and watered by ſeveral rivers. This diſtrict is chiefly celebrated for woollen manufactures, being ſeated on the eaſtern ſide of a grand and high branch of the Andes.

CORDOVA, a neat clean town, in the above-mentioned diſtrict, diſtant 156 miles from Buenos Ayres, and pleaſantly ſituated near a wood, at the foot of a branch of the Andes. This town was founded about the year 1550, by Juan Nunez de Prado; and in 1570 erected into an epiſcopal ſee. Its chapter conſiſts of the biſhop, dean, archdeacon, chantor, rector, and treaſurer; but it has neither canons nor prebendaries. Cordova is ſituated between the river Primero, ſo called becauſe it is the firſt of five in the neighbourhood, which flow in the ſame direction, and a hill, on a level but ſandy ſoil, ſo that the rains ſpeedily paſs, though the vapours be unwholeſome. The city approaches a ſquare form; but the cathedral is irregular, from the want of ſymmetry in the towers. There are many good and ſtrong houſes in the city, but ſeldom high, though the roofs be elevated; and there are three convents, and two colleges, one of which the Franciſcans have abſurdly ſtyled the univerſity. Few places of equal extent can diſplay equal wealth; all the inhabitants, Spaniards as well as Creoles, being noted for activity and induſtry. The chief trade is in mules, which are brought from the ſouthern provinces; and having fed them in the fields, they conduct them to the fair of Salta, where they are ſold to merchants from Peru, at 8 or 10 dollars each; but ſome ſend them, on their own account, to be ſold in the Peruvian markets, the value being proportioned to the diſtance. The inhabitants may be 600; and the ſlaves, moſtly of different mixtures, do not procure their freedom ſo eaſily as in other parts of America. As meat is very cheap, and the ſlaves weave and make their own clothes, they are at once eaſily maintained, and very uſeful; nor do they wiſh for freedom, being neither fatigued nor oppreſſed. The female ſlaves are excellent waſher-women, and go into the river with the water above their middle; nor are they deficient in other kinds of induſtry. The ladies of Cordova are meanly clothed, and careful obſervers of the cuſtoms of their anceſtors; whence the ſlaves are not permitted to wear any cloth but that manufactured in the country. The wine, and a conſiderable part of the grain, are procured from Mendoza; while brandy is brought, in leathern bags or bottles, from S. Juan de la Frontera, 30 leagues to the N.W. of Mendoza, on the northern extremity of the province of Cuyo. N. lat. 31° 30′. W. long. 63° 15′.

CORDOVA, *Mountains of*, are a chain paſſing N. and S. on the W. of that province, regarded by ſome as a branch of the Andes, and ſaid to be covered with perpetual ſnow. Theſe mountains, according to Helms, ſometimes preſent red and green granite, and gneiſs, while the grand chain of the Andes conſiſts of argillaceous ſchiſtus. As the ridge of mountains becomes gradually higher, the population increaſes; but at Ramanſo, 60 miles from Cordova, they again branch, and ſo far from one another, that from that place to Tucuman the traveller paſſes through a ſaline plain, 70 Spaniſh miles in length, and for the moſt part barren and deſart, from which the mountains are ſeen at a diſtance. The whole ground is covered with a white incruſtation of ſalt; and bears no plants except the "ſalſola kali," which grows here to the height of four Pariſian yards. The decayed town of "St. Jago de Eſtero" is ſituated in this plain.

CORDOVA, a conſiderable town of North America, in Mexico, the chief article of its trade being ſugar, for which it has 33 mills. Eſtalla ſays, there are 260 families of Spaniards, 126 of Meſtizos, and 273 of Mexican Indians. Thiery deſcribes Cordova as a large town, with numerous domes, towers, and ſteeples, and a large ſquare in the centre, with Gothic arcades on three ſides, the cathedral filling the fourth; and a fountain of delicious water in the middle. The ſtreets are wide, ſtraight, and paved, and the houſes moſtly of ſtone; but the inhabitants are indolent. The ſituation is in a kind of natural paſſage towards the province of Mexico; the vegetation being rich and beautiful, on a ſoil of red clay, from 10 to 15 feet in depth, producing all the fruits of the two hemiſpheres. N. lat. 19° 15′. W. long. 97° 40′.

Cordova, *New*. See Cumana.

CORDOUAN, *the Tower of*, an extremely well-conſtructed pharos or light-houſe, at the mouth of the river Gironde, in France; 66 miles N.W. of Bourdeaux, and 15 miles S.W. of La Rochette; in N. lat. 45° 35′ 15″. It was rebuilt by Louis XIV. in the year 1665. The formidable maſs of rocks on which it ſtands is formed by the reefs that ſkirt the ſhore. The tower itſelf is 160 feet high, the great lanthorn 15; and from 200 to 350 pounds of pitcoal are conſumed in it every night. The watchmen are generally relieved every fortnight; they take care, however, to provide themſelves with at leaſt one month's proviſions, becauſe the boats cannot approach the rocks but when the ſea is perfectly calm. F. A. Fiſcher's Travels in Spain, Letter vi.

CORDUBA, Cavr. Francesco, in *Biography*, a painter and engraver of Italy, by whom we have a ſet of 44 etchings, middling ſized upright plates, from the fountains in the gardens about Rome, enlivened by figures much in the ſtyle of Callot. He marks his plates thus: "Eques Franc. Corduba del et Sculp." Strutt. Heinecken.

Corduba, in *Botany*, Cluſ. See Asparagus *albus* and *Aphyllus*.

Corduba, now *Cordova*, in *Ancient Geography*, a town of Spain, S.E of Mellaria, upon the river Bœtis. It was in this town, as Strabo informs us, that the Romans fixed their habitation, when they firſt entered Spain. But if it be true that it was founded by Marcellus, as Strabo himſelf ſays, we are led to imagine, that from the time when the Romans firſt inhabited it to the period when Marcellus conducted a colony hither, it could not have been very conſiderable. However, Silius Italicus ſays, that it ſubſiſted from the time of the ſecond Punic war. However this be, it was from the epoch of Marcellus that it bore the title of a patrician colony, from his having eſtabliſhed in it families of this order. Corduba was the firſt place which the Romans had in Spain, diſtinguiſhed by the appellation of *Conventus*, and with the privilege of coining money. It afterwards became ſo conſiderable, that Strabo compares it, with regard to its commerce, with Gades; and he alſo extols the extent and fertility of the adjacent country. It was no leſs celebrated for its literary reputation, as it was the reſidence of the two Senecas, and of the poet Lucan. On ſome medals, bearing the name of Corduba, we ſee on one ſide a well-dreſſed female head, and on the other a winged figure, holding a cornucopia; but the greateſt number of medals belonging to this city are inſcribed with "Colonia Patricia." It is probable that it was called by the firſt name before the eſtabliſhment of the colony, and afterwards by the other. See Cordova.

CORDUENA, a town of Armenia. See Gorduena.

CORDULA, or Cordyla, *Portus*, a port of Aſia in Pontus, upon the Euxine ſea, according to Arrian, who places it between mount *Sacer* and *Hermonaſſa*, S.E. of *Trapezus*.

CORDUS, or Sordus, the name given to an ancient people of Gallia Tarragonenſis, who dwelt in the vicinity of the Pyrenées, upon the coaſt of the Mediterranean ſea.

Cordus, Aulus Cremutius, in *Biography*, a ſenator and hiſtorian of Rome, during the reigns of its firſt two emperors. In his hiſtory of the civil wars, and of the reign of Auguſtus, he refers to C. Caſſius, and denominates him "the laſt of the Romans." For this offence he was impeached, and put on his trial; during which he manfully vindicated his cauſe, and in his defence exclaimed, "Poſterity will pay to every man his due honour, nor, if I am condemned, will there be wanting thoſe who will cheriſh the memory, not only of Brutus and Caſſius, but of me alſo." This was not the effuſion of an enthuſiaſt, but the confidence to which his virtue and talents gave him a juſt claim. His prediction has been abundantly fulfilled; and it affords us pleaſure, at the diſtance of nearly two thouſand years, to record the heroiſm of a man who diſdained to fear the arm of power, and who held in contempt the tyrant Sejanus, whoſe name has deſcended with as much infamy attached to it, as that of Cordus has with unſullied honour. Foreſeeing that he ſhould be condemned by the tribunal appointed to hear his cauſe, he reſolved to put an end to his life, by abſtaining from his daily food. On the fourth day, finding himſelf well nigh exhauſted by hunger and debility, he ſent for his beloved daughter, Marcia, from whom he had concealed his intention, and, embracing her with tender affection, apologized for keeping this only ſecret from her, adding, "I am now half-way on the road, and you neither ought to call me back, nor can do it." She departed; and while his accuſers and judges were debating what courſe to purſue, he breathed his laſt in peace. The ſenate ordered his books to be burnt; and though ſome copies were ſpared, which his daughter cauſed to be made as public as poſſible, yet nothing now remains except an eulogy of Cicero, preſerved in the Suaſoria of M. Seneca. Of their value an eſtimate may be formed by the character given of them by Seneca. Speaking to Marcia, he ſays, "You have well deſerved of Roman literature, and of poſterity, to whom will deſcend a faithful record of events, which coſt the author ſo dear: you have well deſerved of himſelf, whoſe memory will live and flouriſh, as long as it is thought worth while to know the hiſtory of Rome; as long as there ſhall remain any one, who ſhall wiſh to recur to the acts of his anceſtors, any one who ſhall be deſirous of knowing what a Roman once was; what, when all necks were bowed beneath the Sejanian yoke, was the character of an unconquerable ſpirit, free in his head, his heart, his hands." Rom. Hiſt.

Cordus, Euricius, by Melchior Adam called *Henry Urban*, celebrated for his ſkill in medicine and in poetry, was a native of Simmerſhuys in Heſſe. To aſſiſt himſelf in the proſecution of his ſtudies, he employed ſome of his early years in inſtructing the ſons of ſome of the neighbouring gentry. In performing this office, he had the good fortune to attract the notice of Eraſmus. In 1521 he went to Italy, where he attached himſelf in a particular manner to the ſtudy of botany; collecting and examining a number of rare plants, and diligently comparing them with the deſcriptions of them left by Dioſcorides. At Ferrara he took the degree of doctor in medicine, which he afterwards taught at Erfurt and Marpurg. In 1535 he went to Bremen, where he ſpent the ſmall remainder of his life, which terminated, when he was only of a middling age, in the year 1538. He was author of ſeveral, and ſome very valuable, works. His "Treatiſe on the Engliſh Sweating Sickneſs" was publiſhed at Fribourg, in 1529, 4to.; and in 1532, he gave a Latin verſion of the Theriaca, and Alexipharmica of Nicander. His "Botanologicon, ſive Colloquium de Herbis," was printed at Colonna, in 1534, which is commended by Haller, and was ſeveral times reprinted; and his "De Abuſu Uroſcopiæ," in 1546, at Frankfort. His Latin poems were publiſhed in the Deliciæ Poet. Germ. His ſon,

Cordus, Valerius, who followed in the ſteps of his father, and who acquired a ſtill greater portion of fame for his botanical reſearches, was born February 18th, 1515. The early part of his education he received under his father, who ſent him for further improvement to Wittenberg, and other German univerſities. Applying almoſt excluſively to the ſtudy of botany, he ranged over the neighbouring countries, in ſearch of plants, of which he made a conſiderable collection, many of them not before known or noticed. In 1542 he went to Italy, and viſited the univerſities of Padua, Piſa, Lucca, and Florence; every where converſing with the moſt eminent of the profeſſors. In his way to Rome, he had the misfortune to be wounded in his leg, by the kick of a horſe; but not thinking it dangerous, and continuing his excurſions, in ſearch of plants, the wound, by the time he arrived at Rome, was ſo much inflamed as to occaſion a fever, which put an end to his life in September, 1544, when he was only 29 years of age. He left ſeveral works, among them a "Hiſtory of Plants," many of them never before deſcribed. It was publiſhed by Conrad Geſner. Alſo, "Annotations on Dioſcorides;" "Diſpenſatorum Pharm. omnium quæ in uſu ſunt Noribergæ;" "De Spermate Ceti, vulgi dict." &c. Haller Bib. Botan. Eloy Dict. Hiſt. Gen. Biog.

CORDWAINERS, or Cordiners, the term whereby the ſtatutes denominate *ſhoe-makers*.

The word is formed from the French *cordonnier*, which Menage derives from *cordouan*, a kind of leather brought from *Cordoua*, whereof they formerly made the upper-leathers of their ſhoes. Others derive it from *corde, rope*, becauſe anciently ſhoes were made of cords; as they ſtill are in ſome parts of Spain, under the name of *alpargates*. But the former etymology is better warranted: for, in effect, the French workmen, who prepared the *cordouas*, are ſtill called *cordouanniers*.

In Paris they have two pious ſocieties, under the titles of *Freres Cordonniers*, *Brothers Shoemakers*, eſtabliſhed by authority towards the middle of the ſeventeenth century; the one under the protection of St. Criſpin, the other of St. Criſpianus, two ſaints who had formerly honoured the profeſſion. They live in community, and under fixed ſtatutes and officers; by which they are directed both in their ſpiritual and ſecular concerns. The produce of their ſhoes goes into a common ſtock, to furniſh neceſſaries for their ſupport; the reſt to be diſtributed among the poor.

By ſtat. 1. Jac. I. c. 22. the maſters and wardens of the cordwainers company in London are to appoint ſearchers and triers of leather; and leather is not to be ſold before it is ſearched and ſealed. See Company.

CORDYLA, in *Botany*, Lour. Cochinch. Boſc. Dict. Hiſt. Nat. claſs and order, *monadelphia decandria.*

Gen. Ch. *Cal.* campanulate, with four acute diviſions. *Cor.* none. *Stam.* Filaments twenty-four, united at the baſe. *Piſt.* Germ ſuperior; ſtyle one; ſtigmas ſimple. *Peric.* Berry pedicelled, oval, acute, one-celled. *Seeds* ſix, oval.

Sp. C. *parvifolia.* A large tree. *Leaves* ſmall, oblong, emarginate, ſmooth. *Flowers* in ſmall, lateral, ſolitary tufts. A native of the eaſtern coaſts of Africa.

Cordyla, in *Ichthyology*, an American fiſh, the *Scomber cordyla* of Gmelin, the *Guara-tereba* of Marcgraave, and the *Trachurus braſilienſis* of Ray.

CORDYLINE, in *Botany*, Roy. See Dracæna *draco*, and Yucca *glorioſa et draconis.*

CORDYLOCARPUS, (from κορδυλη, *a club*, and καρπος, *fruit*, alluding to the form of the ſilique.) Willd. 1248. Desfont. (Sinapi; Encyc.) Claſs and order, *tetradynamia ſiliquoſa.* Nat. Ord. *Siliquoſæ*, Linn. *Cruciferæ*, Juſſ.

Gen. Ch. *Cal.* four-leaved, caducous; leaves linear, nearly cloſe. *Cor.* four-petalled, cruciform, open; claws the length of the calyx; border oval, quite entire. *Stam.* Filaments ſix, erect, filiform; two lateral ones ſhorter; anthers almoſt erect, ſmall, oval. *Piſt.* Germ ſuperior, cylindrical, ſwollen at the upper end; ſtyle very ſhort; ſtigma obtuſe. *Peric.* Silique jointed; the laſt joint diſtant, globular, ſwollen, terminated by the permanent ſtyle. *Seeds* ſeveral, convex, ſomewhat compreſſed, oblong.

Eſſ. Ch. Calyx nearly cloſe. Silique cylindrical, jointed; the laſt joint more diſtinctly ſeparated.

Sp. 1. C. *muricatus.* Poiret in Encyc. 1. Willd. 1. Desf. Atl. 2. 72. tab. 152. "Siliques one-celled, ſpreading; laſt joint muricate; leaves partly lyrate." *Root* annual. *Stems* about two feet high, erect, ſcabrous, hiſpid, eſpecially on the lower part, ſlightly ſtriated, branched; branches alternate, axillary. *Leaves* ſmooth, or clothed with a few diſtant hairs; lower ones oblong, or elliptical, decurrent; ſome quite entire, others lyrate; upper ones lanceolate, alternate, ſlightly ſinuated, or a little toothed. *Flowers* alternate, almoſt ſeſſile, in a terminal raceme; calyx ſmooth, or ſomewhat villous, coloured; corolla pale yellow. *Siliques* ſmooth, or a little villous. *Seeds* four or five. Diſcovered by Desfontaines about Mayane, in the kingdom of Algiers. 2. C. *lævigatus.* Willd. 2. Poir. 2. (Sinapi græcum; Tourn. Cor. 17. It. 1. 398. tab. 35. Erucaria aleppica; Gært. 298. tab. 143. fig. 9. Vent. Jard. de Cels. tab. 64.) "Siliques two-celled, preſſed; terminal joint ſmooth; leaves pinnatifid." *Stem* a foot high, erect, quite ſmooth; branches alternate, widely ſpreading. *Leaves* ſomewhat fleſhy, alternate, ſmooth, petioled; ſegments linear, entire, channelled. *Flowers* in terminal upright racemes; corolla purple, or pale red. A native of the iſlands of the Archipelago.

CORDYLUS, in *Ancient Geography*, a town of Aſia, placed by Steph. Byz. in Pamphylia.

Cordylus, in *Zoology*, a ſpecies of lizard, the Lacerta *cordylus* of Gmelin and Linnæus, with a ſhort verticillated tail, denticulated ſcales, and a ſmooth body. It is found in Aſia and Africa. Its body is livid or blackiſh.

CORE, in *Rural Economy*, a name applied to a diſorder incident to ſheep, occaſioned by the preſence of ſmall flat worms ſituated in the liver. The greateſt chance of removing this complaint is by changing the ſheep into a more airy and dry paſture.—It alſo ſignifies the heart of the wood of trees, and likewiſe of ſome ſorts of fruit, as the apple, pear, &c.

Core *Bank*, in *Geography*, a narrow iſland of America, on the coaſt of N. Carolina, about 40 miles long, and ſcarcely 2 broad. N. lat. 34° 22′ to 34° 55′. W. long. 76° 26′ to 76° 50′.

Core *Sound* lies on the coaſt of N. Carolina, ſouth of, and communicating with, Pamlico.

COREA, or Coreæ, in *Ancient Geography*, a place at which Paleſtine commenced on the northern ſide, according to Joſephus; who ſays it was near Scythiopolis and a fortreſs named Alexandrium.

Corea, in *Geography*, called by the Chineſe *Kao-li*, and by the Mantchew Tartars *Sol-ho*, a kingdom of Aſia, in the form of a peninſula, extended between China and Japan, and every where ſurrounded by the ſea, except towards the north, where it is connected with Chineſe Tartary, which bounds it on the north; it is bounded on the eaſt by the ſea and iſles of Japan; on the ſouth by the ſtraits of Corea, ſeparating it from Japan, and by the ocean; and on the weſt by the Yellow ſea, which parts it from China. This kingdom is commonly reckoned to be 200 leagues in length from N. to S. and 100 in breadth from E. to W. The great number of ſhoals and ſand-banks which ſurround the coaſts of this peninſula, render acceſs to it by ſea equally dangerous and difficult. Its leaſt diſtance from Japan is only 25 leagues. The origin of the Coreans is very obſcure. It appears, however, that this peninſula was at firſt inhabited by different tribes, which compoſed ſeveral ſtates; and that, in proceſs of time, they united under the ſame government, and formed one kingdom, which was called *Kao-li*. The Coreans were moſt probably of Tartarian extraction. This kingdom is governed by a ſovereign, who exerciſes abſolute authority over his ſubjects, although he himſelf is a vaſſal and tributary of the emperor of China. On every ſucceſſion to the crown, the prince receives on his knees the inveſtiture of his ſtates, granted, or at leaſt, confirmed by the emperor, and diſtributes among the emperor's envoys the ſum of 800 taëls, and ſeveral other cuſtomary preſents. The miniſter of Corea afterwards repairs to Pe-king, to proſtrate himſelf before the emperor, and preſent him the tribute. The princeſs, who has eſpouſed the king, cannot aſſume the title of queen, until ſhe has received it from the court of Pe-king.

The Japaneſe conquered this kingdom about the end of the 16th century; but the Coreans, aſſiſted by the Tartars, who had ſubdued China, drove them from their country. The Mantchews, thus maſters of Corea, endeavoured to compel their new ſubjects to ſhave their heads, after their manner, and to adopt the Tartar dreſs. This innovation irritated their minds, and occaſioned a general revolt throughout the kingdom of Corea, which was at length appeaſed by the prudent attention of the reigning family. The interior geography of this kingdom is little known: we are informed, however, that it is divided into eight provinces, containing 40 diſtricts, 33 cities of the firſt claſs, 58 of the ſecond, and 70 of the third. King-kitan, or Kinka-tao, ſituated in the province of King-hi, is the capital of the whole kingdom, and the ordinary reſidence of the ſovereign. This prince is abſolute maſter of all the wealth of his ſubjects, which he inherits after their death. He is very rigid in the adminiſtration of juſtice; and particular puniſhments are appointed for murder, robbery, and adultery. Every ſeventh year all the freemen of the different provinces are obliged to go to court in rotation, and to keep guard round his perſon for two months; ſo that, during this year, the whole country is in motion and under arms.

The Coreans are well-formed, ingenious, brave, and tractable. They are fond of dancing and muſic, and peculiarly docile in acquiring the ſciences, which they are ſaid to ſtudy with ardour. Men of learning are diſtinguiſhed from other claſſes of people by two plumes of feathers, which they wear in their caps. When merchants preſent any books for ſale to the Coreans, they ſhew their reſpect by dreſſing in the richeſt attire, and burn perfumes before they treat concerning the price. The northern Coreans are of a larger ſize, and more robuſt than thoſe of the ſouth; they are addicted to arms and become excellent ſoldiers; uſing, in combat, croſs-bows and very long ſabres. The Coreans do not inter their dead till three years after their deceaſe; they wear mourning for a father or mother three years, and for a brother three months. When they perform the ceremony of interment, they place around the tomb the clothes, chariot, and horſes of the deceaſed, and any thing elſe of which he was fond when alive; all which they leave to be carried away by thoſe who aſſiſted at the funeral. Their houſes conſiſt only of one ſtory, and are very ill built; in the country, they are of earth, in cities, generally of brick; but they are all thatched with ſtraw. The walls of their cities are conſtructed after the Chineſe manner, with ſquare turrets, battlements, and arched gates. Theſe people have borrowed their writing, dreſs, religious worſhip, ceremonies, belief of the tranſmigration of ſouls, and the greater part of their cuſtoms, from the Chineſe. Their language, however, is different. (See China.) Their women are ſubject to leſs reſtrictions than thoſe of China; and they alſo differ from the Chineſe with regard to their marriage ceremonies. In China, fathers and mothers often marry their children without their conſent and even without their knowledge; but in Corea, the contracting parties chooſe for themſelves, nor do they conſult the inclinations of their parents, or allow them to interpoſe any obſtacles in the way of their union. The principal productions of Corea are wheat, rice, and ginſeng. This country alſo produces gold, ſilver, iron, foſſil ſalt, caſtor and ſable's ſkins, a beautiful yellow varniſh, the ſplendour of which is almoſt equal to gilding, and which diſtils from a tree reſembling the palm tree, ſmall horſes about three feet high, and white paper. Small bruſhes for painting are made here of the hair of a wolf's tail, which are much eſteemed in China. The paper of Corea, of which a conſiderable quantity is annually imported into China, is made of cotton; it is as ſtrong as cloth, and thoſe who write upon it make uſe of a ſmall hair bruſh or pencil: without the precaution of rubbing it over gently with a little alum-water, it would not bear the ink of European pens. With this paper the Coreans partly pay the tribute due to the emperor, ſupplying the palace with it every year. The Chineſe purchaſe it, not for the purpoſe of writing, but for filling up the ſquares of their ſaſh-windows, becauſe, when oiled, it reſiſts the wind and rain much better than theirs; they alſo uſe it as wrapping-paper; and it is likewiſe ſerviceable to their tailors, who rub it between their hands till it becomes as ſoft and flexible as the fineſt cotton cloth, inſtead of which they often employ it in lining clothes. If it be too thick for the purpoſe intended, it may be eaſily ſplit into two or three leaves; and theſe leaves are even ſtronger, and leſs liable to be broken, than the beſt paper of China.

The ſea-coaſts of Corea abound with fiſh; many whales are found there every year towards the north-eaſt, ſeveral of which, it is ſaid, bear in their bodies the darts and harpoons of the French and Dutch, from whom they have eſcaped in the northern extremities of Europe. If this be true, it ſeems to indicate the exiſtence of a paſſage from thence into the ſeas that lead to the north of America. We refer the reader for farther information with regard to this country to Du Halde and Groſier.

Corea, *Strait of*, that part of the ſea which ſeparates the ſouthern part of the continent of Corea from the Japan iſlands, between N. lat. 34° and 36°, and E. long. 130° and 132° 30′. The channel, ſays Perouſe (Voyage, vol. ii. p. 17, Eng. ed.), that ſeparates the coaſt of Japan from the continent may be 15 leagues wide, but it is reduced to 10 leagues by rocks which uninterruptedly border the ſouthern coaſts of Corea, from Quelpaert, and which continued, till we had doubled the S.E. point of that peninſula, ſo that we were able to keep very cloſe to the continent, diſtinguiſh the houſes and towns on the coaſt, and reconnoitre the bays. We ſaw, ſays Perouſe, on the ſummits of the mountains ſome fortifications exactly ſimilar to European forts. It is highly probable the principal means of defence, employed by the Coreans, are directed againſt the Japaneſe. This part of the coaſt is very favourable to navigation, for there appears no cauſe of danger; and at 3 leagues in the offing the depth of water is 60 fathoms over a muddy bottom; but the country is mountainous, and appears very arid. The ſnow was not entirely melted in ſome hollows (May, 1787); and the ſoil ſeemed but little ſuſceptible of cultivation. The habitations, however, are very numerous. We counted a dozen ſampanes, or junks, ſailing along the coaſt, and ſeeming in no reſpect to differ from thoſe in China, their ſails being alſo made of matting. See DAGELET, *Iſland of.*

COREATIS, in *Ancient Geography*, a place of India, near the mouths of the Indus, according to Arrian.

CORED, in *Geography*, a town of Egypt; 16 miles N.E. of Belbeis.

CORED *Herrings*. See HERRINGS.

COREGGIO, in *Biography*. See CORREGGIO.

COREGLIO, in *Geography*, a town of Italy, in the ſtate of Lucca; 15 miles N. of Lucca.

COREGONI, in *Ichthyology*, a diviſion of the SALMO, including thoſe with ſcarcely conſpicuous teeth.

COREIA, in *Antiquity*, a feſtival in honour of Proſerpine, named *Core*, Κορη, which, in the Moloſſian dialect, ſignifies a beautiful woman.

CORELLA, in *Geography*, a town of Spain, in Navarre, on the Alhama; 6 leagues from Tudella.

CORELLI, ARCANGELO, in *Biography*. The performance and compoſitions of this admirable muſician, form an æra in inſtrumental muſic, particularly for the VIOLIN, and its kindred inſtruments, the *tenor* and *violoncello*, which he made reſpectable, and fixed their uſe and reputation, in all probability, as long as the preſent ſyſtem of muſic ſhall continue to delight the ears of mankind. Indeed, this moſt excellent maſter had the happineſs of enjoying part of his fame during mortality; for ſcarce a contemporary muſical writer, hiſtorian, or poet, neglected to celebrate his genius and talents; and his productions have contributed longer to charm the lovers of muſic by the mere powers of the bow, without the aſſiſtance of the human voice, than thoſe of any compoſer that has yet exiſted. Haydn, indeed, with more varied abilities, and a much more creative genius, when inſtruments of all kinds are better underſtood, has captivated the muſical world in, perhaps, a ſtill higher degree; but whether the duration of his favour will be equal to that of Corelli, who reigned ſupreme in all concerts, and excited undiminiſhed rapture full half a century, muſt be left to the determination of time, and the encreaſed rage of depraved appetites for novelty.

Corelli was born at Fuſignano, near Imola, in the territory of Bologna, in February 1653. He is ſaid by Adami to have received his firſt inſtructions in counterpoint from Matteo Simonelli of the Papal chapel; but the general opinion is, that his maſter on the violin was Giambatiſta Baſſani, of Bologna. It has been ſaid (Life of Handel, 1760, p 46.) without authority, that Corelli went to Paris in the year 1672, but was ſoon driven thence by the jealouſy and violence of Lulli. That he viſited Germany after he had finiſhed his ſtudies, we are aſſured by Gaſpar Printz (Satyr. Tomponiſt, 3ten. Theil. p. 227.) who informs us, that he was in the ſervice of the duke of Bavaria, in 1680. Soon after this period, he ſeems to have returned to Italy, and ſettled at Rome, where, about 1683, he publiſhed his firſt “Twelve Sonatas.” In 1685, the ſecond ſet appeared, under the title of “Balletti da Camera,” which, the ſame year, gave riſe to a controverſy between the author and Paolo Colonna, concerning the diatonic ſucceſſion of fifths, between the firſt treble and the baſe of the allemand in the ſecond ſonata. In 1690, Corelli publiſhed the third opera of his ſonatas; and in 1694, the fourth, which, conſiſting of movements fit for dancing, like the ſecond, he called “Balletti da Camera.”

In the works of the poet Guidi, publiſhed at Verona, 1726, it is recorded that, in 1686, when our king James II. piouſly ſent an ambaſſador to pope Innocent XI. to make a tender of his duty as a faithful ſon of the Romiſh church, at a grand academia which Chriſtina queen of Sweden, then a proſelyte, and reſident in the Alma Citta di Roma, gave on the occaſion, the muſic was compoſed by Bernardo Paſquini, and the band, amounting to one hundred and fifty performers on bowed-inſtruments, *inſtrumenti d' arco*, led by Arcangelo Corelli.

About this time, when the opera was in a very flouriſhing ſtate at Rome, Corelli led the band as principal violin.

But his ſolos, the work by which he acquired the greateſt reputation during his life time, did not appear till the year 1700, when they were publiſhed at Rome, under the following title: “Sonate à Violino, e Violone, ò Cembalo, Opera quinta, Parte prima, Parte ſeconda, Preludii, Allemande, Corrente, Gighe, Sarabande, Gavotte e Follia.” This work was dedicated to Sophia Charlotta, electreſs of Brandenburgh. His great patron at Rome was cardinal Ottoboni, the general encourager of polite arts and learning, to whom, in 1694, he dedicates his “Opera Quinta,” and in whoſe palace he conſtantly reſided, *col ſpetioſa carattere d' attuale ſervitore* of his eminence, as he expreſſes himſelf in the dedication.

Creſcimbeni (Comment. della Volg. Poeſia, vol. i. chap. xi. Roma 1702.) ſpeaking of the ſplendid and majeſtic *academia*, or concert, held at cardinal Ottoboni's every Monday evening, ſays, that this performance was regulated by Arcangelo Corelli, that moſt eminent profeſſor of the violin: *famoſiſſimo profeſſore di violino.*

In 1708, we have an honourable teſtimony of his high rank in the profeſſion, given at Venice in the firſt edition of the “Armonico prattico al Cembalo,” by Franceſco Gaſparini, who calls him, “virtuoſiſſimo di violino, e vero Orfeo di noſtro tempo,” (cap. vii.) And Adami, in ſpeaking of Simonelli, Correlli's firſt maſter in counterpoint, ſays, that he made many ſcholars, “among whom, the moſt celebrated was the famous Corelli, the chief glory of the age, with the fame of whoſe five works, already publiſhed, the world is filled; and the ſixth, conſiſting of concertos, which he is now (1711) poliſhing for the preſs, will complete his immortality.”

A very particular and intelligent friend, upon whoſe judgment and probity we have a moſt perfect reliance, having had a converſation with Geminiani about five or ſix years before his death, and a friend of his at that time having had in meditation the writing a hiſtory of muſic, he committed to paper, when he got home, the chief particulars of his converſation, ſuppoſing they might be of ſome uſe to his friend; but as the plan he had in view has been long laid aſide, we have been favoured with the anecdotes and particulars that were obtained from Geminiani, which, as they chiefly concern Corelli, and were communicated by one of his moſt illuſtrious ſcholars, who heard and ſaw what he relates; we ſhall inſert them here.

“At the time that Corelli enjoyed the higheſt reputation, his fame having reached the court of Naples, and excited a deſire in the king to hear him perform; he was invited, by order of his majeſty, to that capital. Corelli, with ſome reluctance, was at length prevailed on to accept the invitation; but, leſt he ſhould not be well accompanied, he took with him his own ſecond violin and violoncello. At Naples he found Aleſſandro Scarlatti, and ſeveral other maſters, who entreated him to play ſome of his concertos before the king; this he for ſome time declined, on account of his whole band not being with him, and there was no time, he ſaid, for a rehearſal. At length, however, he conſented; and in great fear performed the firſt of his concertos. His aſtoniſhment was very great to find that the Neapolitan band executed his concertos almoſt as accurately at ſight, as his own band, after repeated rehearſals, when they had almoſt got them by heart. *Si ſuona*, (ſays he to Matteo, his ſecond violin) *à Napoli!*

“ After this, being again admitted into his majeſty's preſence, and deſired to perform one of his ſonatas, the king found one of the adagios ſo long and dry, that being tired, he quitted the room, to the great mortification of Corelli. Afterwards, he was deſired to lead in the performance of a maſque compoſed by Scarlatti, which was to be executed before the king; this he undertook, but from Scarlatti's little knowledge of the violin, the part was ſomewhat awkward and difficult: in one place it went up to F; and when they came to that paſſage, Corelli failed, and was unable to execute it; but he was aſtoniſhed beyond meaſure to hear Petrillo, the Neapolitan leader, and the other violins, perform that which had baffled his ſkill. A ſong ſucceeded this in C minor, which Corelli led off in C major; *ricomminciamo*, ſaid Scarlatti, good-naturedly. Still Corelli perſiſted in the major key, till Scarlatti was obliged to call out to him, and ſet him right. So mortified was poor Corelli with this diſgrace, and the general bad figure he imagined he had made at Naples, that he ſtole back to Rome in ſilence.

“ It was ſoon after this, that a hautbois player, whoſe name Geminiani could not recollect, acquired ſuch applauſe at Rome, that Corelli, diſguſted, would never play again in public. All theſe mortifications, joined to the ſucceſs of Valentini, whoſe concertos and performance, though infinitely inferior to thoſe of Corelli, were become faſhionable, threw him into ſuch a ſtate of melancholy and chagrin, as was thought, ſaid Geminiani, to have haſtened his death.”

This account of Corelli's journey to Naples is not a mere perſonal anecdote, as it throws a light upon the comparative ſtate of muſic at Naples and at Rome, in Corelli's time, and exhibits a curious contraſt between the fiery genius of the Neapolitans, and the meek, timid, and gentle character of Corelli, ſo analagous to the ſtyle of his muſic.

In 1712, his concertos were publiſhed in a beautiful edition, engraved at Amſterdam, by Eſtienne Roger and Michael Charles le Cene, and dedicated to John William, prince palatine of the Rhine; but, alas! the author ſurvived the publication of this admirable work but ſix weeks; the dedication bearing date at Rome, the 3d day of December 1712, and he died on the 18th of January 1713!

He was buried in the church of the Rotunda or Pantheon, in the firſt chapel on the left hand of the entrance of that beautiful temple, where a monument, with a marble buſt on it, was erected to his memory, near that of the great painter Raphael, by Philip William, count palatine of the Rhine, under the care of Cardinal Ottoboni; on which is the following inſcription:

D. O. M.
Archangello Corellio a Fuſignano
Philippi Willelmi Comitis Palatini Rheni
S. R. I. Principis ac Electoris
Beneficentia
Marchioni de Ladenſburg

Vixit Annos LIX. Mens X. Dies XX.
Obiit. IV. Id. Januarii Anno Sal. MDCCXIII.

During many years after his deceaſe, there was a kind of commemoration of this admirable muſician in the Pantheon, by a ſolemn ſervice, conſiſting of pieces ſelected from his own works, and performed by a numerous band, on the anniverſary of his funeral. A ſolemnity which continued as long as his immediate ſcholars ſurvived, to conduct and perform in it. The late Mr. Wiſeman, who arrived at Rome before the diſcontinuance of this laudable cuſtom, aſſured us that his works uſed to be performed, on this occaſion, in a ſlow, firm, and diſtinct manner, juſt as they were written, without changing the paſſages in the way of embelliſhment. And this, it is probable, was the way in which Corelli himſelf uſed to play them.

Of the private life and moral character of this compoſer, little new information can now be acquired or expected; but if we may judge of his equanimity and natural diſpoſition by the mildneſs, ſweetneſs, and even tenor of his muſical ideas, his temper muſt have endeared him to all his acquaintance, as much as his talents.

Indeed, the account that is given of his dying worth 6000*l.* beſides a valuable collection of pictures, and bequeathing them all to his patron Cardinal Ottoboni, does more honour to his parſimony and gratitude, than judgment; a muſician leaving money to a cardinal, while he had a relation or neceſſitous friend in the world, ſeems to favour more of vanity, than true generoſity. And the cardinal, himſelf, manifeſted his opinion of this bequeſt, by keeping only the pictures, and diſtributing the reſt of Corelli's effects among his poor relations, to whom they naturally appertained.

To attempt to give a character here of Corelli's compoſitions, which have been ſo long heard and univerſally admired, may to many of our readers appear wholly uſeleſs; yet as they are thrown aſide as antiquated lumber by ſome, and regarded as models of perfection by others, our wiſh to rank each muſician in his true place, with equity and fairneſs, inclines us to make a few reflexions on the genius and works of this maſter, before we quit the ſubject.

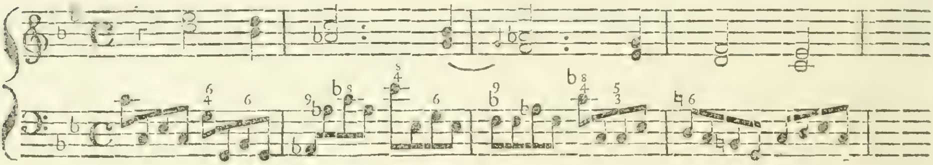
As Corelli originally ſtiled the ſecond and fourth opera of his ſonatas, “ *Balletti da Camera*,” from the dancing and familiar movements contained in them; the firſt and third ſet, from their gravity of ſtyle and movement, may be called “ Sonate da Chieſa.” The ſame diſtinction may be made with propriety in his concertos, and even ſolos; the firſt eight of the former, and ſix of the latter, being much more ſolemn and eccleſiaſtical than the reſt.

With regard to the intrinſic worth of his four books of ſonatas at preſent, notwithſtanding the exquiſite pleaſure they may have afforded ourſelves and others, during youth, it is very much diminiſhed by the general improvement of melody, knowledge of the bow, and boldneſs of modulation, which have freed invention from former ſhackles, and generated new ideas and effects. Indeed, during the time of Corelli, and long after, every one who knew the mechanical laws of harmony, however ignorant of the violin, ſet about compoſing ſonatas, ſolos, and concertos, for it; but the great maſters of that inſtrument, whoſe genius and invention have kept pace with their hand, have now nearly cruſhed all ſuch inſipid and impotent attempts.

Corelli's ſolos, as a claſſical book for forming the hand of a young practitioner on the violin, has ever been regarded as a moſt uſeful and valuable work, by the greateſt maſters of that inſtrument. We were told by Mr Wiſeman at Rome, that when he firſt arrived in that city, about twenty years after Corelli's deceaſe, he was informed by ſeveral perſons who had been acquainted with him, that his "Opera Quinta," on which all good ſchools for the violin have been ſince founded, coſt him three years to reviſe and correct. Tartini formed all his ſcholars on theſe ſolos; and Signor Giardini has told us, that of any two pupils of equal age and diſpoſition, if the one was to begin his ſtudies by Corelli, and the other by Geminiani, or any other eminent maſter whatever, he is ſure that the firſt would become the beſt performer.

The concertos of Corelli ſeem to have withſtood all the attacks of time and faſhion with more firmneſs than any of his other works. The harmony is ſo pure, ſo rich, and ſo grateful; the parts are ſo clearly, judiciouſly, and ingeniouſly diſpoſed; and the effect of the whole, from a large band, ſo majeſtic, ſolemn, and ſublime, that they preclude all criticiſm, and make us forget that there is any other muſic of the ſame kind exiſting.

Geminiani, according to our friend's memorandums, whence an extract has already been given, aſſerted that "Corelli availed himſelf much of the compoſitions of other maſters, particularly of the maſſes in which he played at Rome; that he acquired much from Lulli, particularly the method of modulating in the legatura, and from Bononcini's famous Camilla." This was not very intelligible: nor does the charge appear well founded; as Lulli has made but little uſe of the *legatura*. With theſe maſſes we are unacquainted; but we find frequent imitations of the more natural paſſages of Scarlatti, particularly in the beautiful adagio of his eighth concerto, in which there is a great reſemblance to a movement in a cantata which was ſet by Scarlatti in 1704, eight years prior to the publication of Corelli's concertos.



Geminiani's character of Corelli, upon the whole, however, ſeems very juſt; he ſaid, that "his merit was not depth of learning, like that of Aleſſandro Scarlatti; nor great fancy, or rich invention in melody or harmony; but a nice ear and moſt delicate taſte, which led him to ſelect the moſt pleaſing harmonies and melodies, and to contract the parts ſo as to produce the moſt delightful effect upon the ear." At the time of Corelli's greateſt reputation, Geminiani aſked Scarlatti what he thought of him, who anſwered, that "he found nothing greatly to admire in his compoſition, but was extremely ſtruck with the manner in which he played his concertos, and his nice management of his band, the uncommon accuracy of whoſe performance gave the concertos an amazing effect even to the eye as well as the ear:" for, continued Geminiani, "Corelli regarded it as eſſential to the *enſemble* of a band, that their bows ſhould all move exactly together, all up, or all down; ſo that at his rehearſals, which conſtantly preceded every public performance of his concertos, he would immediately ſtop the band if he diſcovered one irregular bow."

There ſeems ſome juſtice in Geminiani's opinion, that Corelli's continual recourſe to certain favourite paſſages betrays a want of *reſource*. They were ſo many *bar reſts* for his invention. All the varieties of Corelli's harmony, modulation, and melody, might perhaps be compriſed in a narrow compaſs. The muſical index to his works would not be long.

Indeed Corelli was not the inventor of his own favourite ſtyle, though it was greatly poliſhed and perfected by him. Torelli's concertos, though poſthumous, were publiſhed three years before thoſe of Corelli; and we know not how long they had been compoſed, or how often performed, previous to publication.

For a model of his graver ſonatas in the firſt and third ſet, he certainly had thoſe of Baſſani in his mind; and for the lighter ſort, he had many models. His ſolos ſeem drawn from his own ſource more entirely than any of his other productions.

There was little or no melody in inſtrumental muſic before Corelli's time. And though he has much more grace and elegance in his *cantilena* than his predeceſſors, and ſlow and ſolemn movements abound in his works; yet true pathetic and impaſſioned melody and modulation ſeem wanting in them all. He appears to have been gifted with no uncommon powers of execution; yet, with all his purity and ſimplicity, he condeſcended to aim at difficulty, and manifeſtly did all he could in rapidity of finger and bow, in the long unmeaning allegros of his firſt, third, and ſixth ſolos; where, for two whole pages together, common chords are broken into common diviſions, all of one kind and colour, which nothing but the playing with great velocity and neatneſs could ever render tolerable. But like ſome characters and indecorous ſcenes in our beſt old plays, theſe have been long omitted in performance.

Indeed his knowledge of the power of the bow, in varying the expreſſion of the ſame notes, was very much limited. Veracini and Tartini greatly extended theſe powers; and we well remember our pleaſure and aſtoniſhment in hearing Giardini, in a ſolo that he performed at the oratorio, 1769, play an air at the end of it with variations, in which, by repeating each ſtrain with different bowing, without changing a ſingle note in the melody, he gave it all the effect and novelty of a new variation of the paſſages.

However, if we recollect that ſome of Corelli's works are now more than a hundred years old, we ſhall wonder at their grace and elegance; which can only be accounted for on the principle of eaſe and ſimplicity. Purcell, who compoſed for ignorant and clumſy performers, was obliged to write down all the faſhionable graces and embelliſhments of the times, on which account his muſic ſoon became obſolete and old faſhioned; whereas the plainneſs and ſimplicity of Corelli have given longevity to his works, which can always be moderniſed by a judicious performer, with very few changes or embelliſhments. And, indeed, Corelli's productions continued longer in unfading favour in England than in his own country, or in any other part of Europe; and have ſince only given way to the more fanciful compoſitions of the two Martini's, Zaneſti, Campioni, Giardini, Bach, Abel, Schwindl, Boccherini, Stamitz, Haydn, Mozart, and Pleyel.

After the publication of Corelli's works, the violin ſeems to have increaſed in favour all over Europe.

CORENDELIN, in *Geography*, a town of Swiſſerland, in the canton of Soleure; 10 miles N. of Soleure.

CORENTIN, a conſiderable river of South America, in Dutch Guiana.

COREOPSIS, in *Botany*, (from κορις, a *bug*, and οψις, *appearance*, alluding to a fancied reſemblance between the ſeed and the inſect.) Linn. gen. 981. Schreb. 1325. Willd. 1538. Gært. 1037. Juſſ. 188. Vent. 2. 528. (Coriope; Enc.) Claſs and order, *ſyngeneſia polygamia fruſtranea.* Nat. Ord. *Compoſitæ oppoſitifoliæ*, Linn. *Corymbiferæ*, Juſſ.

Gen. Ch. *Cal.* many-leaved, generally double, ſometimes ſimple, and ſomewhat imbricated. *Cor.* compound; florets of the diſk numerous, hermaphrodite, fertile, tubular, five-toothed; florets of the ray female, abortive, ligulate, ſpreading, large. *Stam.* Filaments five, capillary, very ſhort. *Piſt.* Germ compreſſed; ſtyle filiform; ſtigma bifid. *Recep.* generally chaffy. *Seeds* ſolitary, compreſſed, crowned with a two or three-horned border.

This genus differs from bidens in having a ray, and from verbeſina in having the florets of the ray barren.

Sp. 1. C. *ferulæfolia.* Willd. 1. Jacq. Hort. Schœn. 3. 65. tab. 373. "Leaves bipinnated; pinnulæ linear-lanceolate, with ribs half their breadth." *Root* perennial; outer-leaves of the *calyx* numerous, reflexed. A native of Mexico. 2. C. *verticillata.* Linn. Sp. Pl. 1. Mart. 1. Willd. 2. Bot. Mag. 156. (C. foliis verticillatis; Gron. Virg. 131. Chryſanthemum; Pluk. Mant. 48. tab. 344. fig. 4.) "Leaves decompound-pinnated; ſegments filiform." *Root* biennial. *Stem* from a foot and half to three feet high, erect, ſtriated. *Leaves* ſeſſile, oppoſite, but often appearing to grow in whorls in conſequence of being cut to the baſe into linear ſegments, which are curved in various directions. *Flowers* terminal; florets of the diſk brown; of the ray yellow; calyx ſhort; outer leaves narrow, looſe, ſhorter than the others. A native of Virginia and Louiſiana. 3. C. *delphinifolia.* Lam. 2. (Ceratophyllus Delphinii foliis; Vaill. act. 1720. Ehret. pict. tab. 9. fig. 1.) "Leaves tripartite-pinnated; ſegments linear, channelled on the upper ſurface." Nearly allied to the preceding, but conſtantly diſtinguiſhed from it by its foliage and habit. *Root* perennial. *Stem* a foot and half high, erect, ſmooth, ſtriated. *Leaves* oppoſite, connate, ſeſſile, divided at the baſe into three pinnated ſegments. *Flowers* terminal; florets of the diſk brown, on a ſomewhat prominent receptacle; of the ray yellow, acute, entire, or bifid; outer ſcales of the calyx narrow, looſe, obtuſe. A native of Virginia. It may perhaps be doubted which of the laſt two is the verticillata of Linnæus. 4. C. *tenuifolia.* Willd. 3. Ehrt. Beitr. 7. 168. "Leaves three or five in a whorl, pinnated; pinnæ linear, three-parted or undivided; diſk the ſame colour with the ray." *Root* perennial. A native of Carolina. Willdenow ſuppoſes this ſpecies to be the verticillata of La Marck; but he cannot be right, if it have the diſk and ray of the ſame colour; for La Marck, who deſcribed from a living plant, expreſsly ſays, that the diſk of his verticillata is brown, and its ray yellow. It is on this circumſtance alone, that the ſeparate exiſtence of tenuifolia ſeems to depend. 5. C. *coronata.* Linn. Sp. Pl. 2. Mart. 2. Willd. 4. (Ceratophyllus foliis pentapteris; Vaill. act. 1720. 328. Bidens pentaphylla; Plum. Sp. 10. ic. 53. fig. 2.) "Leaves pinnated, ſerrated, marked with lines, ſmooth." *Root* annual. The plant is altogether that of Bidens frondoſa; but it has the flowers of C. verticillata, with a large ray of eight ſtriated, oval florets. A native of Virginia. 6. C. *trichoſperma.* Willd. 5. Mich. am. 2. 139. "Leaves pinnated, lanceolate, ſerrated, ſmooth; ſcales of the outer calyx ciliate-ſerrated." A native of Upper Carolina, in moiſt ground. 7. C. *ariſtata.* Willd. 5. (C. ariſtoſa; Mich. am. 2. 1. 140.) "Leaves pinnated, ſerrated, pubeſcent; horns of the ſeed very long, divaricated." A native of North America in the country of the Illinois. 8. C. *leucorhiza.* Mart. 18. Lour. Cochin. 508. "Leaves pinnated; pinnæ five, ſerrate-gaſhed; ray ſix-flowered; ſeed three-horned." *Root* ſpindle-ſhaped, fleſhy, white. *Stem* a foot and half high, herbaceous, erect, quadrangular, grooved. *Leaves* quinate, lanceolate. *Flowers* entirely ſaffron-coloured, few together, on terminal peduncles; florets of the ray ſix; egg-ſhaped, quite entire; horns of the ſeed beſet with inverted briſtles; calyx erect, many-leaved. A native of China. 9. C. *mitis.* Willd. 7. Mich. amer. 2. 140. "Lower leaves bipinnatifid; upper ones linear, three-parted; ſeeds naked." Calyxes generally ſimple, ſometimes ſomewhat calycled. A native of marſhes in Carolina. 10. C. *leucantha.* Linn. Sp. Pl. 6. Mart. 3. Lam. 6. (Bidens leucantha; Willd.) "Leaves pinnated, ſerrated: florets of the ray of a different colour from thoſe of the diſk." *Root* annual. *Stem* three or four feet high, quadrangular, ſmoothiſh; the oppoſite ſides channelled; branches oppoſite. *Pinnæ* five, ſeldom three, egg-ſhaped, undivided, ſmooth, equal, even; the three outer often confluent, almoſt decurrent by the outer ſide, quite entire at the tip; petioles channelled, connected on both ſides by villous hairs. *Flowers* terminal, alternate, two or three, on longiſh peduncles; inner ſcales of the calyx five; outer five, ſmaller, more diſtinctly ſeparated; florets of the ray five, egg-ſhaped, three-toothed, three-nerved underneath; diſk ſmall, convex, yellow. *Seeds* three-horned, hiſpid backwards. Linn. A native of Virginia. La Marck thinks it not diſtinct from C. coronata. 11. C. *odorata.* Lam. 7. (C. chryſantha; Linn. Sp. Pl. 5. Mart. 4. Willd. 7. Bidens americana triphylla; Plum. Sp. 10. ic. 53. fig. 1.) "Leaves ternate, ſerrated, ſmooth; floret of the ray of a different colour." *Root* ſweet-ſcented, whitiſh, fibrous. *Stem* about three feet high, quadrangular, ſmooth, ſweet-ſcented. *Leaves* oppoſite; generally compoſed of three egg-ſhaped, acute, ſmooth, toothed-leaflets. *Flowers* terminal, ſolitary; florets of the ray white; of the diſk-yellow, reſembling the common camomile. *Seeds* two-horned; receptacle almoſt hemiſpherical. Plum. MSS. A native of the Weſt Indies, and South America. Linnæus, in his ſpecific character, deſcribes the ray as ſimilar in colour to the diſk, and if he had not quoted Plumier as his only ſynonym, we ſhould have thought La Marck referred to a different plant. 12. C. *biternata.* Willd. 19. Lour. Coch. 508. “Leaves twice ternate, ovate-lanceolate, ſerrated; panicle diffuſe; ray ſix-flowered.” *Stem* two feet high, herbaceous, quadrangular, four-grooved. *Flowers* entirely yellow. *Seeds* with two branched horns. *Receptacle* flattiſh, naked. A native of China about Canton. The naked receptacle is inconſiſtent with the generic character. 13. C. *aurea.* Mart. 13. Willd. 9. Hort. Kew. 3. 252. “Leaves ſerrated; root ones three-parted; ſtem ones trifid or entire, lanceolate-linear.” *Root* perennial. A native of North America. 14. C. *tripteris.* Linn. Sp. Pl. 9. Mart. 5. Lam. 3. Willd. 10. (C. Virginianum, folio anagyridis; Moris. hiſt. 3. 21. tab. 3. fig. 44.) “Lower ſtem leaves pinnated, upper ones ternate, uppermoſt ſimple, petioled; leaflets lanceolate-linear.” *Root* perennial. *Stems* three or four feet high (ſix or ſeven; Mill.) erect, cylindrical, ſmooth, branched near the ſummit. *Flowers* ſolitary, in a looſe corymbus, with a yellow ray and brown diſk; florets of the ray pointed, entire or with two teeth. A native of Virginia. 15. C. *ſenifolia.* Willd. 11. Mich. am. 2. 138. “Leaves quite entire, ternate, ſeſſile.” A native of ſandy hills in Carolina. 16. C. *alba.* Linn. Sp. Pl. 8. Mart. 6. Lam. 8. Willd. 12. (C. ſcandens; Brown. Jam. 321. Chryſanthemum americanum, ciceris folio glabro; Herm. par. tab. 124. Pluk. alm. 101. tab. 160. fig. 3.) “Leaves generally ternate, wedge-ſhaped, ſerrated.” *Root* perennial. *Stems* a foot and half long, ſlender, incapable of ſupporting themſelves, branched. *Leaves* often quinate, ſmooth. *Flowers* terminal, peduncled; florets of the ray about eight, white; ſometimes with a tinge of purple, rather large; thoſe of the diſk orange-yellow. *Seeds* two-horned. A native of St. Cruz, one of the Antilles. 17. C. *fœtida.* Mart. 20. Willd. 13. Cav. ic. 1. 55. tab. 77. “Leaves heart-ſhaped, three-lobed, acuminate, ſerrated, middle lobe longer.” *Root* annual. *Stem* ſix feet high, erect, cylindrical, branched, cloathed with a ſhort glutinous nap. *Leaves* glutinous, fœtid, oppoſite; petioles long, connate at the baſe. *Flowers* in a corymb, entirely yellow; calyx-leaves ſixteen, ovate-acute, keeled; eight outer ones blackiſh-green, hirſute, glutinous; florets of the ray eight, three-nerved, ſomewhat emarginate. *Seeds* inverſely egg-ſhaped, obſcurely three-ſided, compreſſed, with two white capillary horns. A native of Mexico. 18. C. *reptans.* Linn. Sp. Pl. 3. Mart. 7. Lam. 9. Willd. 14. Smith ſpicil. 20. tab. 22. (Chryſanthemum trifoliatum ſcandens; Sloan. Jam. 125. hiſt. 1 261. tab. 154. fig. 2, 3.) “Leaves ſerrated, egg-ſhaped; upper ones ternate; ſtem creeping.” *Root* annual, ſmall, fibrous. *Stem* five feet high, weak, climbing, ſquare at the baſe, ſomewhat cylindrical above, ſtriated, branched. *Leaves* oppoſite, acute, veined, ſoft, ſlightly downy, bright green, paler underneath; petioles channelled, hairy. *Flowers* entirely gold-coloured; peduncles from three to five, from the axils of the top leaves, erect, cylindrical, ſtriated, hairy, ſingle-flowered; ſometimes with two or three lanceolate bractes at the baſe; calyx nearly cylindrical; a few of the outer leaves ſpreading; florets of the ray four-toothed, veined; anthers half excluded, brown; germ linear, ciliate at the edges, ſtigmas downy above, obtuſe. Smith. A native of Antigua. 19. C. *heterophylla.* Willd. 15. Cav. ic. 3. 34. tab. 268. “Leaves ſcabrous; thoſe from the root, panduriform, repand; on the ſtem, lanceolate, ſerrated, attenuated at the baſe, nearly ſeſſile.” A native of Mexico. 20. C. *baccata.* Linn. jun. Supp. 380. Mart. 8. Lam. 11. Willd. 16. “Leaves egg-ſhaped, ſerrated: ſeeds reſembling a berry.” *Stem* eight feet high, herbaceous, erect. *Leaves* oppoſite, petioled, three-nerved. *Flowers* yellow, peduncled, often three together, terminal; calyx-leaves ſixteen, lanceolate, recurved, the length of the diſk; florets of the ray three-toothed. *Seeds* naked, nearly globular, black, ſomewhat tetragonous, ſitting on a convex receptacle and forming an aggregate not unlike the compound berry of rubus; down none. A native of Surinam. The naked ſeeds exclude it from this genus, independent of the peculiar ſtructure of the fruit. 21. C. *auriculata.* Linn. Sp. Pl. 7. Mart. 9. Lam. 4. Willd. 17. Mich. Amer. 2. 138. (Chryſanthemum hirſutum virginianum; Pluk. Alm. 101. tab. 83. fig. 5. and tab. 242. fig. 4. C. virg. trifoliatum; Moris. Hiſt. 3. 20. tab. 3. fig. 45.) “Leaves quite entire, egg-ſhaped; lower ones ternate.” *Root* perennial. *Stem* a foot and half or two feet high, filiform, cylindrical, ſlightly villous, a little branched towards the top. *Leaves* oppoſite, connate; lower ones with two ſmall leaves at the baſe which make them appear auricled, ſmooth above, ſlightly villous underneath; petioles channelled. *Flowers* entirely yellow, terminal; florets of the ray eight, large, five-toothed. A native of Virginia. 22. C. *lanceolata.* Linn. Sp. Pl. 10. Mart. 10. Lam. 5. Willd. 18. Mich. Am. 2. 137. (Bidens ſucciſæ folio; Dill. Elth. 55. tab. 48. fig. 56. B. caroliniana; Mart. Cent. tab. 26.) “Leaves lanceolate, quite entire, ciliated.” *Root* biennial. *Stems* ſeveral, a foot and half high, decumbent at the bottom, thence riſing obliquely. *Root-leaves* long, ſpread on the ground, thickiſh, narrowed towards the baſe, reſembling thoſe of ſcabioſa ſucciſa. *Flowers* large, yellow; peduncles long, ſmooth; florets of the ray eight or nine, deeply four-toothed. *Seeds* with three horns. A native of Carolina. 23. C. *craſſifolia.* Mart. 14. Willd. 19. Hort. Kew. 3. 253. “Leaves inverſely egg-ſhaped, oblong, obtuſe, quite entire, pubeſcent.” *Root* perennial. A native of Carolina, flowering from Auguſt to September. 24. C. *latifolia.* Willd. 20. Mich. Amer. 2. 137. Lam. Illuſt. tab. 794. fig. 2? “Leaves egg-ſhaped, acuminate, crenate-toothed; ſeeds naked.” A native of Carolina, on high mountains. 25. C. *anguſtifolia.* Mart. 15. Willd. 21. Hort. Kew. 3. 253. “Leaves alternate, linear-lanceolate, quite entire, even ſurfaced; florets of the ray oblong, trifid; middle ſegment larger.” A native of Carolina and Florida. 26. C. *alata.* Willd. 22. Cav. ic. 3. 30. tab. 260. “Stem winged; leaves alternate, ſcabrous, roundiſh egg-ſhaped, wedge-ſhaped at the baſe, triplinerved.” *Root* perennial. A native of Mexico. 27. C. *alternifolia.* Linn. Sp. Pl. 11. Mart. 12. Lam. 10. Willd. 24. Jacq. Hort. 2. tab. 110. Gært. tab. 171. fig. 9. (Chryſanthemum virginianum, alato caule. Moris. Hiſt. 3. 25. tab. 7. fig. 75, 76. Pluk. Alm. 100. tab. 159. fig. 3.) “Leaves lanceolate, ſerrated, alternate, petioled, decurrent.” Linn. “Stem winged; leaves lanceolate, on ſhort petioles, ſerrated; flowers in corymbs; florets of the ray lanceolate.” Willd. *Root* perennial. *Stems* ſeveral, from five to ſeven feet high or more, erect, firm, ſimple. *Leaves* about five inches long, rugged on both ſides, of a dirty green colour, narrowed at the baſe; the lower ones three or four together or two oppoſite; the reſt alternate. *Flowers* yellow, in a terminal corymb; calyx many-leaved, ſpreading very much; florets of the ray diſtant, two-horned. A native of North America, from Canada to Virginia, flowering in October and November. 28. C, *ovata.* Willd. 23. Cav. ic. 3. 41. tab. 280. “Stem winged; leaves alternate, oblong, nearly ſeſſile, ſerrated; flowers in corymbs; florets of the ray elliptical.” *Root* perennial. Very ſimilar to the preceding, perhaps only a variety. A native of Mexico. 29. C. *procera.* Willd. 25. Hort. Kew. 3. 253. “Leaves elliptical, acuminate, ſerrated, petioled,

tioled, veined, decurrent; lower ones whorled; upper ones alternate." *Root* perennial. A native of North America, flowering in September and October. Profeſſor Martyn conjectures that this is the alternifolia of Linnæus, and that the alternifolia of Hortus Kewenſis is a different plant. 30. C. *radiata.* Mill. Mart. 17. "Leaves linear-lanceolate, ſharply ſerrated, oppoſite; ray of the flower large, entire." *Root* annual. Stems four feet high, erect. *Leaves* from three to four inches long, three quarters of an inch broad, acuminate, on ſhort petioles. *Flowers* two from each of the upper joints of the ſtem, oppoſite; peduncles, long, ſlender, bearing two or three pairs of ſmall leaves or bractes, one-flowered; florets of the ray ſeven, oval, entire; of the diſk numerous, dark-coloured. A native of South Carolina, flowering in Auguſt; raiſed by Miller from ſeeds ſent by Dr. Dale.

Coreopsis *Bidens*; Linn. See Bidens *cernua.*

Coreopsis *foliis linearibus integerrimis*; Gron. See Rudbeckia *anguſtifolia.*

Propagation and Culture. Moſt of the perennial ſpecies are hardy and may be readily increaſed by parting the roots. The ſecond and fourteenth require a light loamy earth and ſunny expoſure. The annuals ſhould be ſown in a hot-bed and afterwards tranſplanted into a warm border.

Coreopsis, in *Gardening,* contains plants of the flowering herbaceous perennial kind; of which the ſpecies cultivated are the whole leaved coreopſis, or tick ſeed ſun-flower. (C. *verticillata.*) The three leaved coreopſis. (C. *tripteris.*) The alternate leaved coreopſis. (C. *alternifolia.*) The ſpan leaved coreopſis. (C. *lanceolata.*)

Method of Culture. The mode of propagation in theſe plants is eaſily effected, either by ſlipping or dividing the roots in autumn when the ſtalks decay, planting them out where they are to remain, keeping them clean from weeds, and cutting down the ſtalks annually in autumn when they begin to decay. The third and fourth ſorts may be rendered more forward by the uſe of a hot-bed. All theſe plants are well calculated for the more large borders and clumps, introducing them in the vacant ſpaces between ſhrubs, as they exhibit a plentiful bloom till late in the autumnal months.

Coresium, in *Ancient Geography,* a lake or marſh in the iſland of Crete. Steph. Byz.

CORESSUS, one of the four towns of the iſland of Ceos, according to Suidas. Ptolemy calls it *Cereſſus*; Strabo, and alſo Steph. Byz. denominate it *Coriſſia.*

Coressus, or *Coreſus,* a name given by Xenophon, Diodorus Siculus, &c. to a high mountain of Aſia Minor in Ionia, about 40 ſtadia from the city of Epheſus. At the foot of this mountain was a town of the ſame name, called by Steph. Byz. *Coriſſos,* which he repreſents as a town of Epheſus, becauſe of its dependence upon it. He ſays that it derived its name from the following circumſtance. Diana, having been delivered of Latona, and having brought her hither aſked of the people of the country to whom this place belonged? they replied "Κορη, σος." Virgin, it is yours. In this fable is traced the etymology of the name.

CORETA, in *Botany,* Brown. See Corchorus *ſiliquoſus.*

CORETT, in *Ichthyology,* the name of a large Eaſt Indian fiſh of the tunny kind, and ſuſpected to be no other than the common tunny, or Scomber *Thynnus.* It grows to ſix or ſeven feet long. Its eyes are large, and their iriſes yellow; its tail is broad and forked, and in colour of a yellowiſh green; its belly-fins are yellowiſh, and its belly of a fine bright gloſſy blue, with a ſilvery caſt. It is generally caught with hooks, and is a very fine taſted fiſh. Ray.

CORETUM, in *Ancient Geography,* a gulf of Palus-Mæotis, according to Pliny; who ſays that a mountain of rocks ſeparated this gulf from the lake of Buges, into which the river Hypanis diſcharged itſelf.

COREVA, or Coreba, a place of Africa propria, on the route from Turburba to Tacape, between Valli and Muſti, according to Antonine.

COREUR, a town of India on this ſide of the Ganges, according to Ptolemy. It is thought to be the ſame with *Cereura.*

CORFE CASTLE, in *Geography,* is an ancient market-town, ſituated near the centre of the Iſle of Purbeck in Dorſetſhire, England; at the foot of a range of hills, on a riſing ground, declining to the eaſt. Its origin muſt undoubtedly be attributed to the caſtle, which exiſted previous to the year 980: though the town itſelf does not appear to have been of any importance till after the conqueſt, it being wholly unnoticed in Domeſday book. The manor and caſtle ſeem always to have deſcended together. Though this is an ancient borough by preſcription, it was not incorporated till 18th Eliz., when ſir Chriſtopher Hatton obtained a charter, inveſting the inhabitants with liberties ſimilar to thoſe of the Cinque-ports, with various other privileges: theſe were confirmed by James I. and Charles II. The government of the town is veſted in a mayor, and eight barons who have ſerved the office of mayor. The earlieſt return to parliament was in 14 Eliz.; the right of election is poſſeſſed by all perſons within the borough who are ſeized in fee, in poſſeſſion, or reverſion, of any meſſuage, or tenement, or corporal hereditament, and in ſuch as are tenants for life or lives, and in want of ſuch freehold, in tenants for years, determinable on any life or lives, paying ſcot and lot. The town conſiſts chiefly of two ſtreets of ſtone buildings. The church, a large ancient fabric, compriſes a nave, chancel, two ailes, and a large embattled tower: twelve irregular arches ſupport the roof, and four pillars, in the Saxon ſtyle, but all different, are connected with the porch. The number of houſes in the late return was 152; and of inhabitants 741; many of whom find employment in the neighbouring clay-works and ſtone quarries; and a few in knitting ſtockings. A weekly market is held on Thurſdays. This town is 116 miles S.W. from London. The diſtrict which includes Corfe caſtle, and is about ten miles in length and eight in breadth, contains twelve or thirteen ſunday ſchools, diſtributed through the different pariſhes; each being governed by a committee of the principal inhabitants, ſubject to the ſuperintendance of a general committee who meet at Corfe caſtle as occaſion may require. The average number of children who attend theſe ſchools is about 400. Dorſetſhire was one of the firſt counties in which Sunday ſchools were eſtabliſhed. Some excellent regulations, relative to the general management of theſe inſtitutions, may be ſeen in Hutchins's Dorſet, vol. i. p. 308, 2d edit.

The caſtle at Corfe "ſtands a little north of the town, oppoſite to the church, on a very ſteep rocky hill, mingled with hard, rubbly chalk-ſtone, in the opening of thoſe ranges of hills that incloſe the eaſt part of the iſle. Its ſituation between the ends of theſe hills deprives it of much of its natural and artificial ſtrength, being ſo much commanded by them, that they overlook the tops of the higheſt towers; yet its ſtructure is ſo ſtrong, the aſcent of the hill on all ſides but the ſouth ſo ſteep, and the walls ſo maſſy and thick, that it muſt have been one of the moſt impregnable fortreſſes in the kingdom before the invention of artillery. It was of great importance in reſpect to its command over the whole iſle; whence our Saxon anceſtors juſtly ſtyled it Corf gate, as being the paſs and avenue into the beſt part of the iſle." (Hutchins's Dorſet, i. 280.) The caſtle is ſeparated from the town by a ſtrong bridge, of four very high, narrow, ſemicircular arches, croſſing a deep moat, now dry. The bridge leads to the gate of the firſt ward, which remains nearly entire, probably from the thickneſs of the walls, which, from the outward to the inner facing, is in ſome parts full nine yards. On the higher part of the hill, at ſome diſtance from the centre of the fortreſs, ſtands the keep or citadel, which ſtill retains nearly its original height, and commands a very extenſive proſpect to the north and weſt.

The preciſe period when this caſtle was built is uncertain; but from concurrent circumſtances its erection is aſcribed to king Edgar. That it did not exiſt previouſly to the year 887, when the nunnery at Shaftеſbury was eſtabliſhed, is certain, from an inquiſition taken 54 Hen. III.; wherein the jurors returned, "that the abbeſs and nuns at Shaſton (Shafteſbury) had, without moleſtation, before the foundation of the caſtle at Corfe, all wrecks within their manor of Kingſton, in the iſle of Purbeck.'

Between two and three miles eaſtward of Corfe, is *Nine Barrow Down*, an eminence ſo named from nine *large* barrows ſituated on it in a line, ſuppoſed to be of Britiſh conſtruction. The whole number of barrows on this down are ſixteen of various dimenſions; moſt of them circular, and very regularly ſhaped. A ſhallow trench ſurrounds eight or ten; and near them is a hollow or cavity. The higheſt part of the down riſes 642 feet above low water mark.

At a ſmall diſtance, north weſt of Corfe, is *Grange* or *Creech Grange*, the ſeat of John Bond, eſq.; it anciently was part of the poſſeſſions of the abbey of Bindon, and the occaſional reſidence of the Abbot. Hutchins's Hiſtory of Dorſetſhire.

CORFINIUM (*S. Pelino*), in *Ancient Geography*, a town of Italy, the capital of the Peligni, ſituated at a ſmall diſtance from the Aternus, on a delightful plain ſurrounded by mountains. In the time of the Social war, A. U. C. 662, the allies fortified it, and made it a place of arms. During the civil wars, Cæſar obliged Domitian to retire hither, beſieged him there, and took the place.

CORFU, in *Geography*, the ancient Corcyra (which ſee), an iſland of the Mediterranean, at the mouth of the Adriatic, near the coaſt of Albania, about 15 leagues long and 8 wide. In ancient times the inhabitants of this iſland formed a powerful republic; in ſucceeding times it belonged to the king of Naples; and it was afterwards ſold for 30,000 ducats to the Venetians, who maintained a fleet of galleys in the port, and a ſtrong garriſon to defend this and the neighbouring iſlands. It was ſeized by the French in 1797; and by an article in the treaty of Campo Formio, in 1797, the French republic was allowed by his majeſty, the emperor, king of Hungary and Bohemia, to poſſeſs, in full ſovereignty, the ci-devant Venetian iſlands of the Levant, *viz.* Corfu, Zante, Cephalonia, St. Maure, Cerigo, and other iſlands dependent on them, together with all the ci-devant eſtabliſhments in Albania, which are ſituate lower down than the gulf of Lodrino. In 1799 this iſland was taken by the Ruſſians, and, together with Cephalonia and Zante, &c. conſtitute an independent republic under the protection of Ruſſia.

This iſland is ſaid to contain about 50,000 perſons, and is divided into four bailiwicks or governments. The religion of Corfu is partly that of the Latin and partly that of the Greek church. The latter has for its chief a proto-papa, or head-prieſt, elected in an aſſembly of the clergy and nobility; he is immediately dependent on the patriarch of Conſtantinople, and poſſeſſes all the epiſcopal powers. His office laſts five years, and he then returns to the claſs of ordinary papas, with the privilege of wearing a crimſon girdle. His revenue is confined to the perquiſites of his office, the amount of which he continues to increaſe, as an indemnity for the expence he incurred in procuring his nomination. To the cathedral there are canons attached, as to that of the Latin church; but they have no fixed prebend. The only advantage accruing from their canonicate is that of being at the head of the clergy, together with the honour of wearing a violet girdle, and a ſmall taſſel of the ſame colour to their hats. The number of churches in Corfu is very conſiderable. Each officiating prieſt is annually elected by the aſſembled pariſhioners; but he has no fixed ſalary. Moſt of the churches, eſpecially thoſe in the country, have been built by private perſons, who, as proprietors, nominate the papa. The richeſt of theſe churches is that in which are depoſited the relics of St. Spiridion, to whom the Greeks pay a peculiar devotion; and the feſtival of this ſaint is celebrated with the greateſt pomp. The night between Holy Thurſday and Good Friday is remarkable for the number of proceſſions which perambulate the city.

In the iſle of Corfu are ſeveral convents of men and women, which tend very much to oppreſs the inhabitants. The ignorance of the Greek clergy, eſpecially in the rural parts, is ſo great as to be proverbial; the moſt learned among them being hardly capable of writing and reading their own language.

The air of this iſland is healthy, the land fertile, and the fruit excellent. Oranges, citrons, the moſt delicious grapes, honey, wax, and oil are very abundant. Some places are mountainous and barren, and good water is ſcarce. Salt forms a great part of its riches.

Corfu, the capital of the fore-mentioned iſland, the ſeat of a bailiff, a proveditor, a captain, &c. and the ſee of an archbiſhop. It is fortified, and defended by two fortreſſes; the town has a good harbour and a conſiderable trade. N. lat. 39° 42′. E. long. 20° 2′.

CORGA, a country of India, near the coaſt of Malabar, bounded on the N. and E. by the Myſore country, on the S. by the country of the Nayrs, and on the W. by the ſea.

CORGATHEA, in *Ancient Geography*, a town of India, according to Ptolemy.

CORGOLOIN, in *Geography*, a town of France, in the department of the Côte d'Or, and diſtrict of Beaune; 5 miles N. of Beaune.

CORI, anciently *Coria*, a town of Italy, in the Campagna di Roma; 10 miles S. of Paleſtrino.

CORIA, or Curia, in *Ancient Geography*, a town of the iſle of Albion, in the country of the Damnii, according to Ptolemy. The conjectures about the ſituation of this place are various and doubtful; but, upon the whole, that of Mr. Baxter ſeems to be the moſt probable, who places it at Kirkintilloch, a place of great antiquity, upon the wall, about 6 miles from Glaſgow.—Alſo, a town of Albion, belonging to the Otadeni, and ſuppoſed to be Corbridge in Northumberland by Camden and Baxter; but Horſley imagines it to have been ſituated much farther north, probably at Jedburgh, and ſuſpects it to have belonged to the Gadeni.—Alſo, a place of Greece, in the Peloponneſus; near the town of Helice, according to Ælian.—Alſo, a town of Italy, near Rome. See Cori.

Coria, in *Geography*, a town of Spain, in the province of Eſtremadura, the ſee of a biſhop. It contains two churches, two convents, and two hoſpitals; near it are medicinal ſprings; 90 miles E. of Toledo, and 110 E.S.E. of Madrid. N. lat. 39° 36′. Long. 10° 28′ E. of Peak of Teneriffe.—

—Alſo, a town of Spain, in the country of Seville, on the Guadalquivir; 7 miles from Seville.

CORIACO, a town of S. America, in the province of Cumana, on a gulf to which it gives name; 40 miles E. of New Cordova. It contains about 6500 perſons.

CORIALLUM, in *Ancient Geography*, a place of Gaul, in the Lyonnenſis ſecunda; near the cape de la Hogue, according to d'Anville.

CORIANDER, in *Agriculture*, the name of a plant which is cultivated in the field by the farmer in ſome diſtricts, though not to any very great extent. In both Eſſex and Kent it is, however, occaſionally met with as a field crop.

In its culture it is adviſed, that the ſeed ſhould be ſown in the autumnal ſeaſon, on rich, friable land, which has been well prepared by tillage; and that when the plants have riſen above the ſurface of the ground, they ſhould be hoed out to the diſtance of about four inches every way, clearing them well from all ſorts of weeds. It is ſuppoſed that by this management they will become ſtrong, and produce a greater quantity of good ſeed.

The advantages of cultivating this ſort of crop are thus ſtated in the fourth volume of the Letters and Papers of the Bath Society.

Sowed ten perches of land with coriander ſeed, the ſoil a good ſandy loam.

Expences.

	£.	s.	d.
Three ploughings	0	1	6
Sowing and harrowing	0	0	1
Four pounds of ſeed, at 3 *d.*	0	1	0

87 pounds of coriander ſeed, at 3 *d.*	1	1	9
Deduct expences	0	5	10
Profit	0	15	11

or 15 *l.* 18 *s.* 4 *d.* per acre.

The author of the paper obſerves, that he has ſince made ſeveral larger experiments in this article, but that none has proved ſo good a crop as the preceding, yet all of them ſuch as to afford a good profit. There is a ready ſale for the ſeed with the diſtillers, druggiſts, and confectioners. The former purchaſe very large quantities: the price varies from 16*s.* to 42*s.*

According to Mr. Vancouver, in his Account of Eſſex Huſbandry, the mode of cultivation is thus performed. "The culture of coriander, which has been much attended to in the neighbourhood of Tolſhunt Darcey, is, he ſays, thus managed: old lay-ground is ploughed in the beginning of March, and after the ſurface is completely pulverized, the ſeed is ſown fourteen pounds to the acre; thrice hoeing and ſetting out the plants four inches ſquare will coſt one guinea per acre. Average produce, 10 *cwt.* per acre, 12*s.* per *cwt.* This is conſidered to be a very good preparation, after once ploughing, for wheat; and as the land is generally ploughed in two yard ridges, or ſtitches of eight furrows wide, a row of beans is generally planted with the coriander, on each ſide of the open furrows between the ſtitches, and are uſually harveſted at the ſame time.

"It is frequently the caſe in this diſtrict to cultivate a triple ſort of crop, conſiſting of coriander, carraway, and teaſel.

"When (ſays the above writer) carraway is ſown with the coriander, from the care and attention neceſſarily beſtowed on diſtinguiſhing the plants, the hoeing ſeldom coſts leſs than one guinea and a half per acre; but the carraway is not regularly ſet out for a crop till after the coriander is harveſted, at which time a very expenſive hoeing becomes indiſpenſably neceſſary.

"Teaſel is ſometimes cultivated in the ſame field, the ſeed being ſown with the coriander and carraway; but as neither the carraway nor teaſel come completely and regularly the ſecond year, both crops are uſually allowed to ſtand for the third ſummer. This is eſteemed good management for old coarſe paſture grounds, which, after three ploughings, are commonly ſown with wheat, and then clean chalked."

The following directions are given for this culture, by Mr. Sewell of Mapleſtead: "about the beginning of March, plough ſome old paſture land; if it has been paſture for a century, the better; and the ſoil ſhould be a very ſtrong clayey loam. Mix 12 *lbs.* of carraway, 10 *lbs.* of coriander, and 12 *lbs.* of teaſel ſeeds together, which is ſufficient for one acre; ſow directly after the plough and dreſs (he ſuppoſes harrow) the land well. When the plants appear of ſufficient ſtrength to bear the hoe (which will not be until about ten weeks after ſowing), it muſt not be omitted, and in the courſe of the ſummer it will require three hoeings, and one at Michaelmas; each will be about 8 *s.* per acre. The coriander is annual, and is fit to cut about the beginning of July: it ſhould be left in the field after cutting, and threſhed on a cloth, in the ſame manner as rape ſeed.

"About April following, your teaſel and carraway will want a good hoeing, done deep and well, and another hoeing about the beginning of June; theſe two hoeings are to be done at 7 *s.* per acre each. The carraway will be fit to cut the beginning of July, and muſt be threſhed in the ſame manner as coriander. The teaſel will not be ready till the middle of September, when thoſe heads which are beginning to turn brown are cut off the ſtem, with a ſtalk a foot long, and 25 of them are tied in a bunch, 24 of the bunches are fixed on a ſmall ſtick, and called a row, 240 of which make a load in bulk, equal to a ton of hay from the meadow. The work of cutting and bunching the teaſel can only be done by thoſe who have been well acquainted with and learned the mode; it muſt be looked over, and the heads cut at ſeveral times, as they ripen. The teaſel and carraway are perennial, and ſome of the plants do not perfect their ſeeds till the third or fourth year, though in general you have a crop the ſecond year, and the ſeeds that are ſcattered from the crop the ſecond year often come to perfection the fourth year; he has known inſtances of this being continued for ſeven years. The uſual way is to plough directly after the crop is gathered the third year, and ſow wheat, of which commonly a good crop is obtained, the land being in fine order, from the turf being rotted, and the repeated hoeings. See Teasel.

"The firſt appearance of teaſel, after it is ſown, is much like a lettuce, coriander like a parſnip, and carraway like carrots. The produce of carraway has often been, on the very rich old lays in the hundreds or low lands of the county, 20 *cwt.* per acre. There is always a demand for it in the London market, ſometimes ſo low as 12*s.* per *cwt.*, and it has been up to 50*s.* per *cwt.*; moſtly on an average at 21 *s.*

Coriander is alſo very productive on good land, often producing 24 *cwt.* per acre, ſometimes not more than 6 or 7 *cwt.*, the price being ſometimes 30*s.* per *Cwt.*, often ſo low as 10*s.*, average in general about 16*s.*, London market. Teaſel is uſed only amongſt the manufacturers of ordinary cloth and baizes, to raiſe the wool on them that covers the thread. As we have a large buſineſs of that kind carried on in this part of the country, we have a regular demand for teaſel; the average price 12*l.* per load, the produce ſometimes a load per acre, often not more than one-fourth of a load. The land can only be filled with plants, and the more one kind predominates, the leſs muſt reaſonably be expected of the crop that ſucceeds. It is moſtly ſown on land ſo ſtrong, as to require being a little exhauſted to bring it fit for bearing corn. In moſt of the land ſown with carraway and coriander the teaſel is omitted, as being a more troubleſome and uncertain crop, and generally the product of carraway is much greater without than with teaſel.

"In many parts of this diſtrict there are gardening-farmers who travel about and contract for breaking up old graſs-land, in order to ſow carraway. The farmer ploughs to a great depth, and does whatever horſe-work is wanted, finding the land alſo at a rent of 15*s.* per acre on ſome farms, and the produce is divided. It is reckoned a more profitable way of breaking up graſs than for common crops; but, much depending on a variable price, is reckoned hazardous; though the carraway men have intelligence enough among themſelves to aim at not overſtocking the market.

"It is obſerved, that the coriander is always the firſt crop, the carraway being ſown with it as clover is with barley to ſucceed it; and it is left from three to ſix years, according to the ſucceſs; great hoeing is beſtowed on it to keep the land clean: when it returns to the farmer, if there be twitch he fallows, if not, he ſows wheat. With ſome farmers their half receipt from 30 acres has varied from 180*l.* to 300*l.* a year."

CORIANDER, in *Botany.* See CORIANDRUM.

CORIANDRUM, (*κοριον*, or *κοριαννον*; Theophras. Dioſcor. Coriandrum; Plin. Suppoſed to be ſo called from *κορις*, *a bug*; the bruiſed leaves ſmelling like that offenſive inſect.) Tourn. Cl. 7. § 3. gen. 2. Linn. gen. 356. Schreb. 488. Willd. 552. Gært. 109. Juſſ. 220. Vent. 3. 16. Claſs and order, *pentandria monogynia.* Nat. Ord. *Umbellatæ*, Linn. *Umbelliferæ*, Juſſ.

Gen. Ch. *General umbel* flat. *Partial umbel* generally with abortive flowers in the centre. *General involucre* one-leafed, or none. *Partial involucre* going half way round; or none. *Calyx proper* five-toothed, ſtanding out. *Cor.* Petals five, equal or unequal, emarginate, inflexed. *Stam.* Filaments five; anthers roundiſh. *Piſt.* Germ inferior; ſtyles two, diſtant; ſtigmas capitate. *Peric.* none. Fruit ſpherical, dividing into two. *Seeds* two, concave.

Eſſ. Ch. Petals inflexed, emarginate. General involucre one-leafed or none; partial, going half way round, or none. Fruit ſpherical, or ſcrotiform.

Sp. 1. C. *ſativum.* Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. Gært. tab. 22. fig. 2. Lam. Illuſt. Pl. 196. fig. 1. Woodv. Med. Bot. tab. 181. Eng. Bot. Pl. 67. Bauh. Pin. "Fruit globular." *Root* annual, ſtrong-ſcented. *Stem* about a foot and half high, erect, ſmooth, ſlightly ſtriated, cylindrical, generally branched and divaricated. *Leaves* compound; lower ones pinnated; leaflets roundiſh-wedge-ſhaped, lobed and toothed; upper ones twice-ternate; ſegments linear. *General and partial umbels* many-rayed. *General involucre* of one linear leaf; *partial involucre* from three to five-leaved, going half way round; leaves lanceolate. *Flowers* white, tinged with red; proper calyx very conſpicuous; outer petals of the outer flowers large, forming a kind of ray round the umbel. *Fruit* obſoletely ribbed, aromatic. A native of the ſouthern parts of Europe and of China; naturalized in Suffolk about Ipſwich, and in ſome parts of Eſſex. Every part of the plant, when freſh, has a very offenſive ſmell; but the dried ſeeds have a tolerably grateful ſmell, with a moderately warm and ſlightly pungent taſte. They are ſtomachic and carminative, and are commonly ſold by the confectioners encruſted with ſugar. When taken in large quantities they are ſaid to be deleterious, but Dr. Withering aſſerts that he has known ſix drams of them taken at once, without any remarkable effect. They give out their virtue totally to rectified ſpirit, but only partially to water. The Edinburgh college uſe them in the bitter infuſion and the preparations of ſenna, to cover the diſagreeable taſte, and prevent the griping tendency of thoſe medicines. 2. C. *teſticulatum.* Linn. Sp. Pl. 2. Mart. 2. Lam. 2. Ill. Pl. 196. fig. 2. Willd. 2. (C. minus teſticulatum; Bauh. Pin. 158. Pluk. alm. 120. tab. 169. fig. 2.) *β.* C. ſylveſtre fœtidiſſimum; Bauh. Pin. 158. "Fruit didymous." *Root* annual. *Stem* ſcarcely a foot and half high, angular, branched. *Leaves* once or twice pinnated; leaflets deeply cut into narrow acute ſegments. *Umbels* ſmall, often ſimple. *Partial involucre* none, outer *petals* not forming a ray. *Seeds* ſeparating below, almoſt cohering above, a little wrinkled, but not ſtriated. A native of the ſouth of Europe.

Propagation and Culture.—Both ſpecies are raiſed from ſeeds ſown in the autumn, in an open ſituation, on a bed of good freſh earth. When the plants are come up, nothing farther is neceſſary but to hoe them to about four inches diſtance every way, and to keep them clear from weeds. The firſt ſpecies is cultivated in Eſſex, mingled with carum carui, or carraway; both ſolely for the ſake of the ſeeds. See CARUM CARUI. To prevent the largeſt and beſt part of the ſeed being loſt, women and children are employed to cut every plant ſeparately, and to put it immediately into a cloth, in which it is carried to ſome convenient part of the field, and there threſhed upon a ſail-cloth. The produce of an acre is from ten to fourteen hundred weight. See CORIANDER, in *Agriculture.*

CORIARIA, (ſo called from its uſe in tanning hides.) Lin. Gen. 1129. Schreb. 1540. Juſſ. 441. Vent. 43. Redoul; Enc. Claſs and order, *diœcia decandria* (Polygamia; Gowan.) Nat. Ord. undetermined.

Gen. Ch. *Flowers* dioicous, ſometimes monoicous or polygamous. *Male. Cal.* Perianth very ſhort, five-leaved; leaves ſomewhat egg-ſhaped, concave. *Cor.* Petals (Gland. Juſſ.) five, very ſmall, placed on a diſk on the outſide of the ſtamens. *Stam.* Filaments ten, very ſhort; anthers erect, oblong, with two cells ſeparate at the baſe. *Female Cal.* like the male. *Cor.* Petals, as in the males, converging. *Stam.* as in the males, but abortive. *Piſt.* Germs five, compreſſed, united; ſtyles long, briſtle-ſhaped; ſtigmas ſimple. *Peric.* none. *Seeds* five, kidney-ſhaped, covered by the ſucculent petals which take the appearance of a berry; Linn. (*Peric.* Capſules five, connivent, ſmall, one-ſeeded, not dehiſcent, covered on the ſide by the enlarged and thickened glands, making the fruit look like half a berry; Juſſ.)

Eſſ. Ch. Calyx five-leaved; corolla five-petalled; anthers ten, almoſt ſeſſile. Styles five. Seeds five, covered by the ſucculent petals.

Sp. 1. C. *myrtifolia.* Linn. Sp. Pl. 1. Mart. 1. Poir. 1.

Lam. Ill. Pl. 822. (Rhus myrtifolia monſpeliaca; Bauh. Pin. p. 414.) "Leaves almoſt ſeſſile, ovate-oblong, flowers in racemes." A ſhrub four or five feet high. *Stems* ſmooth, cinereous; branches oppoſite, looſe, flexible; young ones quadrangular. *Leaves* oppoſite, entire, ſmooth, acute, green on both ſides, nerved, ſmaller on the flowering branches. *Racemes* ſimple, terminating the young lateral branches; bractes ſolitary, ſmall, awl-ſhaped; peduncles twice the length of the bractes; calyx and corolla pale green; flowers ſometimes monoicous, and ſometimes hermaphrodite. A native of the ſouth of France, and of Africa about mount Atlas. 2. C. *ruſcifolia.* Linn. Sp. Pl. 2. Mart. 2. Poir. 2. Feuill. Peruv. 3. 17. tab. 12. "Leaves cordate egg-ſhaped, ſeſſile." A tree from twenty to twenty-five feet high. *Trunk* the thickneſs of a man, branched from the bottom. *Leaves* an inch and half long, an inch broad. *Leaves* oppoſite, ternate on the young branches, almoſt embracing the ſtem. *Flowers* as in the preceding ſpecies. A native of Chili. 3. C. *microphylla.* Poir. 3. "Leaves very ſmall, egg-ſhaped, obtuſe, nearly ſeſſile; flowers ſpiked, lateral." A ſhrub. *Stems* quadrangular; branches numerous, crowded, filiform, flexible, ſhort. *Leaves* four or five lines long, three broad, oppoſite, firm, entire, ſlightly heart-ſhaped, green above, paler underneath, nerved. *Flowers* on ſmall filiform peduncles, with ſolitary acute bractes. A native of Peru. 4. C. *ſarmentoſa.* Mart. 3. Poir. 4. Forſt. Flor. Auſt. 71. "Leaves cordate egg-ſhaped, on ſhort petioles; ſtem procumbent, diffuſe. A native of New Zealand.

CORIARIO. See ARTO LEONE.

CORIBRASSUS, in *Ancient Geography*, an epiſcopal town of Aſia, in Pamphylia.

CORIDOR, is uſed, in *Architecture*, for a gallery, or long iſle, around a building leading to ſeveral chambers at a diſtance from each other, ſometimes wholly incloſed, and ſometimes open on one ſide.

CORIDOR, or *Corridor*, in *Fortification*, the ſame as the *covert-way*, which ſee.

CORIDORGIS, in *Ancient Geography*, a town of Germany, ſituated on the Danube, between Medoſtanium and Phurgiſates. Ptolemy.

CORIENTES, in *Geography*, a cape of Mexico, or New Spain, on the N. Pacific ocean. N. lat. 20° 50′. W. long. 105° 30′.—Alſo, a cape of ſouth America, on the coaſt of Peru, in the Pacific ocean. N. lat. 4° 50.—Alſo, a cape of Africa, on the eaſtern coaſt in the Indian ſea. S. lat. 24° 15′. E. long. 33° 31′.—Alſo, the name of the ſouth-weſternmoſt point of the iſland of Cuba. N. lat. 21° 38. W. long. 84° 30′.

CORIENTES, *Los.* See CORRIENTES.

CORILLA, in *Biography*, the Arcadian name given to the celebrated *Improviſatrice,* Maria Maddalena Morelli Fernandez, of Piſtoia; honoured at Rome with the lau crown, 16 Feb. 1776, in the ſame manner as Petrarca, Taſſo, and Perfetto, had been before. An account of this tranſaction, beautifully printed at Parma, by Bodoni, in 1779, contains her diploma and all the diſcourſes, poems, ſonnets, &c. written on the occaſion, with the examination which ſhe underwent, concerning her knowledge of the moſt important ſubjects upon which ſhe was required to *Improviſare,* or treat extemporaneouſly, in verſe publicly at the Campidoglio in Rome. The Italian title of this narrative is, "Atti della ſolenne coronazione fatta in Campidoglio della inſigne poeteſia D-na. Maria Maddalena Morelli Fernandez Piſtoieſe, Tragli Arcadi Corilla Olimpica." Twelve members of the Arcadian academy were ſelected out of 50, publicly to examine this new edition of a *Tenth Muſe,* which has been ſo often dedicated to ladies of poetical and literary talents. Three ſeveral days were allotted for this public exhibition of poetical powers on the following ſubjects: ſacred hiſtory, revealed religion, moral philoſophy, natural hiſtory, metaphyſics, epic poetry, legiſlation, eloquence, mythology, fine arts, and paſtoral poetry.

In the liſt of examiners there appear a prince, an archbiſhop, three monſigneurs, the pope's phyſician, abati, avocati, all of high rank in literature and criticiſm. Theſe, ſeverally, gave her ſubjects, which, beſides a readineſs at verſification in all the meaſures of Italian poetry, required ſcience, reading, and knowledge of every kind. In all theſe ſevere trials, ſhe acquitted herſelf to the ſatisfaction and aſtoniſhment of all the principal perſonages, clergy, literati, and foreigners then reſident at Rome; among the latter was our ſovereign's brother, the duke of Glouceſter.

Near 50 ſonnets by different poets, with odes, canzoni, terze rime, ottave, canzonette, &c. produced on the ſubject of this event, are inſerted at the end of this narrative and deſcription of the order and ceremonials of this ſplendid, honourable, and enthuſiaſtic homage, paid to poetry, claſſical taſte, talents, literature, and the fine arts.

This renowned lady merits ſome notice as a muſician, as well as poeteſs; as ſhe ſung her own verſes to ſimple tunes with a ſweet voice, and in good taſte. She likewiſe played on the violin; but at Florence, where we ſaw and heard her, in 1770, ſhe was accompanied on the violin by the celebrated and worthy pupil of Tartini, Nardini. At this time ſhe was not more than 30; and had a pleaſing, dignified, and intelligent countenance. See in the muſic pl. No. the two airs to which ſhe ſung at Florence, extempore verſes on ſubjects given.

CORIM. See HASTA *militaris.*

CORINÆUM, in *Ancient Geography*, a promontory of Aſia Minor in Ionia; part of mount Mimas.

CORINDIUR, a town of India, on this ſide of the Ganges. Ptolemy.

CORINDUM, in *Botany*. Tourn. See CARDIOSPERMUM.

CORINE, in *Zoology*, the ANTILOPE *Corinna* of Gmelin, has very ſlender, ſhort, ſmooth, ſtraightiſh horns, bent ſlightly into the form of a lyre; the upper parts of the body are yellowiſh-tawny, the under parts white, with a duſky ſtripe along the ſides, and two lines on each ſide of the face, the upper one white and the other black. This animal, which inhabits Senegal, is leſs than a roe; the neck, body, and flanks are of a tawny-yellow colour, the inſides of the thighs and belly are white, and a dark line, along the ſides, divides the two colours; the knees are tufted with hair;

the ears are large; the horns are about ſix inches long, almoſt upright, bending a little outwards in the middle, and ſomewhat approaching at the tips, the lower parts being ſurrounded with circular wrinkles. This ſpecies reſembles the kevel in colour, ſize, ſwiftneſs, and muſky odour; but differs very much from it in the figure of the horns; though Gmelin, after Pallas, ſuſpects that it is the female of that ſpecies.

CORINEA, in *Ancient Geography*, a country of Aſia, in Armenia Major. Ptolemy places it between the ſources of the Tigris and Euphrates, and to the ſouth of Thoſpitide.

CORINEUM, a town ſituated on the ſouthern coaſt of the iſle of Cyprus, between Citium and Salamis. It was epiſcopal, and called by Hierocles, in his Notitia, Coren.

CORINIUM, a town of Albion, belonging to the Dobuni, and allowed to be Cirenceſter in Glouceſterſhire.—Alſo, an ancient town of Illyria on the Adriatic gulf; ſuppoſed to be the preſent *Cori.*

CORINTH, Corinthus, a city of Greece in the Peloponneſus, upon a gulf of the ſame name. This city was the capital of a ſmall ſtate, ſituate on the iſthmus of Corinth, having the bay of that name, now called "Golfo di Lepanto," and the iſthmus or neck of land, which joins Peloponneſus to the continent, on the north; Sicyon, on the weſt; the gulf of Saron, on the eaſt; and the kingdom of Argos, on the ſouth. Its utmoſt extent from eaſt to weſt was about half a degree, and from north to ſouth, about half that ſpace. It had no rivers of any note; but abounded with mountains, the chief of which was called "Acrocorinthium," at the foot of which the city of Corinth was built, and on the top ſtood the citadel. It was alſo famed for the fountain Pyrene, ſacred to the muſes; though others place this fountain on the hill Helicon, and moſt others again, on that of Parnaſſus.

Corinth is ſaid to have been founded by Siſyphus, the ſon of Æolus, and grandfather of Ulyſſes, about the year of the world 2490, as ſome ſay, or according to others 2500; B. C. 1507, and about ſix years before Deucalion's flood, B. C. 1503. The ancient name of this city is ſaid to have been Ephyra, which it took from a nymph of that name, reported to have been the daughter of Oceanus and Tethys, or, according to others, of Myrmex, the wife of Epimetheus, the ſon of Japetus, and brother of Prometheus. At this time it was but an inconſiderable town, though it roſe afterwards to be the metropolis of the kingdom, and one of the nobleſt and moſt opulent cities in Greece.

Corinth, the new name of this city, has been variouſly derived; ſome have deduced it from the Greek κοριϑος, *ſatiety* or *abundance*, implying the opulence of the place; but the ancient inhabitants trace the origin of the appellation to Corinthus, the ſon, as ſome have ſaid, of Jupiter, or, according to others, of Marathon, and brother of Sicyon. However, moſt authors aſcribe the name, as well as the building, or rebuilding of it, to Corinthus, the ſon of Pelops. Corinth was alſo called "Heliopolis," or the city of the Sun, probably, as Gronovius conjectures, from the ruggedneſs and barrenneſs of its ſituation and territory, for ſuch, as Strabo tells us, it really was.

Corinth, beſides the citadel already mentioned, had two port-towns, *viz.* Lecheum ſituate on the bay of Corinth, and Cenchrea on that of Samos, and connected with the city by a double wall of about 12 ſtadia or half a league in length; diſtant from the city 70 ſtadia or about 3 leagues. Theſe were the only two havens; and, indeed, the only two cities of any note, next to Corinth, that belonged to this territory. Theſe were ſo well ſituated for naval commerce, and ſo near the metropolis, that they made ample compenſation for the barrenneſs of the ſoil. Theſe two naval roads which opened a way into the Ionian and Ægean ſeas, might eaſily have gained for them a ſuperiority, if not a command, over all Greece, if this advantageous ſituation had not inclined them more to commerce than war. For their citadel being almoſt impregnable by nature, and commanding both ſeas, they could eaſily cut off all communication betwixt one half of Greece and the other; ſo that it was not without reaſon called one of the fetters of Greece. But being led by their genius and diſpoſition to improve their advantages more for navigation and commerce than for martial exploits, they became in proceſs of time ſo exceedingly opulent, that the little influence they had over the other ſtates was owing rather to their wealth than their valour. By the gradual increaſe of their opulence, partly from commerce, and partly from the influx of ſtrangers that flocked hither from Europe and Aſia, their city became at length one of the moſt conſiderable and ſplendid in Greece; being adorned with a great variety of ſumptuous buildings, ſuch as temples, palaces, theatres, porticos, cenotaphs, baths, and other edifices; all enriched with a beautiful kind of columns, capitals, and baſes, from which the Corinthian *order* took its name, together with numberleſs ſtatues executed by the moſt famous artiſts. Such indeed were its wealth, magnificence, and excellent ſituation, that it was thought by the Romans equally worthy of empire with Carthage and Capua. It would carry us far beyond our limits minutely to deſcribe even the principal edifices that adorned this famous city; but in order to enable the reader to form ſome judgment of its extent and magnificence, we ſhall recite ſome few particulars, referring to Pauſanias "in Cor." for a more ample account. We have already obſerved that this city was ſeated at the foot of a high hill, on which ſtood the citadel. To the ſouth it was defended by the hill itſelf, which is there extremely ſteep. Very ſtrong and lofty ramparts protected it on the other ſides. Its circumference was 40 ſtadia, or about 1½ league; but as the walls extended along the ſides of the hill, and ſurrounded the citadel, it might be reckoned upon the whole at 85 ſtadia or near 3¼ leagues. The road to the citadel had ſo many windings, that the ſummit could not be attained, without paſſing through an interval of 30 ſtadia. The ſituation of the citadel and its ramparts rendered it ſo ſtrong, that it could only be taken by treachery or famine. At the entrance was the temple of Venus, with the ſtatue of the goddeſs clad in brilliant armour, and accompanied by another of the god of love, and a third of the ſun, who was adored in this place before the worſhip of Venus was introduced. In the way to the citadel was a chapel dedicated to the Egyptian Iſis, and another to the Pelagian Iſis. Two others were dedicated, one to Serapis of Canopus, and the other to another Serapis. The ſpring Pyrene, where Bellerophon is ſaid to have found the horſe Pegaſus, was ornamented with ſumptuous embelliſhments, conſiſting of ſeveral caves in form of grottoes, all covered with white marble, from which the cold and limpid water of that fountain fell into a large baſon. The forum was decorated with temples and ſtatues; the theatre was a grand and beautiful edifice of white marble, in which the aſſembly of the people deliberated on affairs of ſtate, and the muſical conteſts and other entertainments were exhibited at the feſtivals. The ſtadium, or courſe, was alſo conſtructed of white marble. The temple of Neptune was a grand building; its avenue was lined on one ſide with the ſtatues of all thoſe athletæ who had won the prize at the Isthmian *games* (which ſee), and on the other with ſtately pines planted in regular rows. The temple itſelf, though not very ſpacious, was adorned with a multitude of brazen Tritons, or ſea-gods. Here were alſo the chariots of Neptune and of his wife Amphitrite, drawn by horſes covered all over with gold, except their hoofs, which were of ivory. The two deities were carved in a ſtanding poſture, and Neptune had young Palæmon riding on a dolphin by his ſide. The baſes of the chariots were likewiſe adorned with curious baſſo-relievos, and the temple itſelf with a multitude of other embelliſhments. Diana of Epheſus was alſo exhibited in a public place together with two gilt wooden ſtatues of Bacchus. Fortune alſo had a temple, and her ſtatue was made of Perſian marble; and near this temple was that which was dedicated to the mother of all the gods. There were ſeveral other ſtatues; among which we may ſelect an Apollo, ſurnamed Clarius, in bronze; a Venus by Hermogenes of Cythera, two Mercuries, three ſtatues of Jupiter, a Minerva in bronze, mounted on a pedeſtal, the baſſo-relievos of which repreſented the Muſes. The city of Corinth abounded with public baths, the number of which was augmented by the emperor Adrian; but thoſe of Neptune, conſtructed by Eurycles of Sparta, were the moſt famous. The temple of Venus at Corinth is ſaid by Strabo to have been ſo rich, that it maintained more than 1000 courtezans, who were devoted to her ſervice, and which drew hither a multitude of ſtrangers. The feſtivals of the Aphrodiſia were celebrated in this city by harlots, as we learn from Athenæus (Deipnos. l. xiii. c. 6.); who alſo informs us, that they who ſupplicated the goddeſs Venus, promiſed to dedicate ſome females to her rites, and they obtained what they requeſted.

At firſt the commerce of Greece was carried on by land, and entered or left the Peloponneſus by the road of the iſthmus. The Corinthians took occaſion to impoſe a duty on the tranſit of all commodities, and derived from this duty a certain degree of opulence. In order to avoid the dangers of the ſea, proverbially ſtormy, between the iſle of Crete and Cape Malea in Laconia, merchants choſe to tranſport their goods to the ſeas terminating at the iſthmus. Thus, the merchandize of Italy, Sicily, and the weſtern nations, was landed at the harbour of Lecheum; and that from the iſlands of the Ægean ſea, the coaſts of Aſia Minor, and of the Phœnicians, at the port of Cenchrea. In proceſs of time, commodities were conveyed by land from one harbour to the other, and means contrived for tranſporting even the veſſels. Corinth, having thus become the mart of Aſia and Europe, continued to collect duties on foreign merchandize, covered the ſea with ſhips, and formed a navy to protect her commerce. Her induſtry was excited and encouraged by ſucceſs; ſhe built ſhips of a new form, and firſt produced (triremes) gallies, with three branches of oars. Her naval force procured her reſpect; all nations poured their productions into her emporium. The ſea was covered with reams of paper, and ſailcloth, brought from Egypt, ivory from Libya, the leather of Cyrene, incenſe from Syria, Phœnician dates, Carthaginian carpets, corn and cheeſe from Syracuſe, pears and apples from Euboea, Phrygian and Theſſalian ſlaves, together with a multitude of other articles which were continually brought into the ports of Greece, and particularly into thoſe of Corinth. The games of the iſthmus alſo drew together to this city a prodigious number of ſpectators. Theſe reſources increaſing the wealth of the ſtate, workmen of every kind were protected, and exerted themſelves with new emulation.

Corinth abounded not only with warehouſes, but with manufactures of her own. Among other articles, the inhabitants made coverlets for beds, which were much ſought after by foreign countries; ſhe alſo collected a great number of the pictures and ſtatues of the beſt maſters. Her manufactures of braſs and earthen ware were held in great eſtimation. Although Corinth poſſeſſed no copper-mines, her workmen contrived, by mixing that which ſhe received from foreign countries, with a ſmall quantity of gold and ſilver, to compoſe a metal extremely brilliant, and almoſt proof againſt ruſt. (See Æs.) Of this they made cuiraſſes, helmets, ſmall figures, cups, and veſſels; no leſs eſteemed for the workmanſhip than for the material, which were enriched with foliage and other chaſed ornaments. Thoſe on their pottery were equally beautiful.

The women of Corinth were admired for their beauty, and the men were diſtinguiſhed by their love of gain, and of licentious pleaſure. Venus was their principal deity; and the courtezans conſecrated to her ſervice, attended, in the time of public calamities and imminent danger, at the ſacrifices, and walked-in proceſſion with the other citizens, ſinging ſacred hymns. The Corinthians, indeed, were ſo much devoted to traffic and luxury, that they very much neglected the encouragement of the liberal arts and ſciences, and alſo of that thirſt for glory and conqueſt, ſo much valued by their neighbours. Nevertheleſs, they cultivated a good diſcipline, both in peace and in war; and this their opulence, with its effects on their diſpoſition and conduct, rendered abſolutely neceſſary. Though they ſeldom, if ever, engaged in war, with a view of enlarging, but chiefly for the purpoſe of defending their territories, protecting ſome neighbouring ſtate, or maintaining the liberty of Greece; yet this ſmall kingdom furniſhed many brave and experienced officers to the other Grecian cities, who were frequently preferred to their own generals. The Corinthians were, in reality, the greateſt aſſertors of liberty; and though they remained for ſome centuries under a monarchical government, yet they always manifeſted an averſion from tyranny, and an inclination to aſſiſt thoſe who were oppreſſed.

We have already obſerved, that Siſyphus was ſuppoſed to be the founder of the Corinthian monarchy; which is ſaid to have continued in the lineal ſucceſſion of his family, for ſeven or eight generations; till it became extinct, or till it was expelled the kingdom by Alethes, one of the Heraclidæ, about thirty years ſubſequent to their return, about B. C. 1074, in whoſe family the kingdom of Corinth remained for a long interval, between three and four hundred years. Royalty was at length aboliſhed, and the ſovereign power was intruſted to 200 citizens, one of whom preſided over the reſt under the appellation of "Prytanis," about the year B. C. 779. About the year 659 B. C., Cypſelus terminated this ariſtocracy, by uſurping the ſole government, and reſtored the monarchy, which he retained for about thirty years. He was ſucceeded by his ſon Periander, who held the government for 44 years. Having baniſhed his ſon Lycophron to the iſland of Corcyra, the capital of which had been built by the Corinthians, in the year B. C. 703, Periander was reduced to the neceſſity of recalling him, but his propoſals were received by the exiled ſon with indignation. He finally, however, reſolved to abdicate the crown, and confine himſelf to Corcyra, whilſt his ſon, quitting that iſland, aſſumed the reins of government at Corinth. But the Corcyreans, dreading the arrival of Periander, defeated this project by putting Lycophron to death. Tormented by impotent rage, Periander died at 80 years of age, after a reign of 44 years. As ſoon as he had cloſed his eyes, the Corinthians deſtroyed every monument, and even the ſlighteſt traces of tyranny. His ſucceſſor reigned only three years; and after this ſhort interval, the Corinthians, joining their troops to thoſe of Sparta, eſtabliſhed a government which ſubſiſted for a long period, and which approached nearer to an oligarchy than a democracy, as no affairs of importance were ſubmitted to the arbitrary deciſion of the multitude. In the year 439 B. C. a war commenced between Corinth and Corcyra; and in the year 435 B.C. the Corinthians were defeated at ſea by the Corcyreans, aided by the Athenians. And this conteſt between Corinth and Corcyra, brought on the Peloponneſian war. In the year 395 B. C. the Athenians, Thebans, Argives, and Corinthians, formed an alliance againſt the Lacedæmonians, and this gave occaſion to the Corinthian war. For an account of the aſſiſtance which Corinth afforded to the Syracuſans, ſee the article Timoleon. By the peace of Antalcidas B.C. 387, the Corinthians were obliged to withdraw their garriſon from Argos, which then became free and independent. When Alexander entered Babylon, the Corinthians ſent ambaſſadors to offer him the freedom of their city; and after firſt treating the offer with contempt, he was afterwards induced to accept it with joy, when he was told, that this honour had been conferred only on Hercules. When Aratus of Sicyon, prætor of the Achæans, had taken poſſeſſion of the citadel of Corinth, B. C. 243, the Corinthians were prevailed upon to enter into the Achæan league; and about the ſame time they iſſued a decree, that the Romans ſhould be admitted to celebrate the Iſthmian games, with the ſame privileges as the Greeks. At a ſubſequent period, B. C. 146, they inſulted the Roman deputies, commiſſioned by Metellus to appeaſe the troubles occaſioned in Peloponneſus by the Achæan league; but upon the arrival of the conſul Mummius, Corinth was beſieged; and after the defeat at the battle of Leucopetra, the conſul entered the city, and abandoned it to be plundered by the ſoldiers. All the men who were left in it were put to the ſword, and the women and ſlaves ſold; and after the ſtatues, paintings, and richeſt moveables, were removed, in order to their being carried to Rome, the houſes were ſet on fire, and the whole city was conſumed. From that time the Corinthian braſs, which was in reputation long before, became yet more famous; for it is pretended, that the gold, ſilver, and braſs, which were melted, and which ran together in this conflagration, formed a new and precious metal. The walls were afterwards demoliſhed, and raſed to their very foundations. This dreadful calamity was inflicted by order of the ſenate, for puniſhing the inſolence of the Corinthians, who had violated the law of nations, in their treatment of the ambaſſadors ſent to them by Rome. The booty taken at Corinth was ſold, and it produced a conſiderable ſum; no part of which Mummius reſerved for himſelf, but conſigned the whole to Rome, for the purpoſe of being laid out in adorning the city. Amongſt the paintings, it is ſaid there was a piece drawn by Ariſtides, the moſt celebrated painter in Greece, which repreſented Bacchus; the beauty of which was not known to the Romans, for Polybius had the mortification to ſee it uſed by the ſoldiers as a table, upon which they played at dice. In the ſale of the booty, it was adjudged to Attalus for 600,000 ſeſterces, or about 3625 *l.* ſterling. Many other ſtatues and paintings of the moſt excellent maſters, preſerved in the wreck of Corinth, were tranſported to Rome. Upon Polybius's return into Peloponneſus, he had the painful and mortifying ſight of the deſtruction and burning of Corinth, and the affliction of finding his country reduced into a province of the Roman empire. Corinth remained in a ruined and deſolate ſtate for many years. At length Cæſar, after he had ſubdued Africa, and whilſt his fleet lay at anchor at Utica, gave orders for rebuilding Carthage; and ſoon after his return to Italy, he likewiſe cauſed Corinth to be rebuilt. Strabo and Plutarch agree in aſcribing the rebuilding of Carthage and Corinth to Julius Cæſar; and Plutarch remarks this ſingular circumſtance with regard to theſe two cities, that as they were taken and deſtroyed in the ſame year, they were rebuilt and repeopled at the ſame time. Under the eaſtern emperors, Corinth was the ſee of an archbiſhop, ſubject to the patriarch of Conſtantinople. Roger, king of Naples, obtained poſſeſſion of it under the empire of Emanuel. It had afterwards its own ſovereigns, who ceded it to the Venetians, from whom it was taken by Mahomet II., in the year 1458. The Venetians retook it in 1687, and held it till the year 1715, when they loſt it to the Turks, in whoſe poſſeſſion it has remained ever ſince.

Corinth, in *Modern Geography*, *Corinto*, or *Coranto*, a town of Greece, in the Morea, ſituated near a narrow iſthmus of the ſame name, which joins the Morea to the reſt of Greece, between the gulf of Lepanto and that of Engia. It was formerly, as we have ſhewn in the preceding article, a very rich and powerful city. At preſent it contains about 13 or 14 hundred inhabitants; each houſe has a garden, planted with orange and other fruit trees. It is 46 miles E. of Athens or Atini, and 342 S.W. of Conſtantinople. N. lat. 38°. E. long. 22° 50′.

Corinth, a townſhip of America, in Orange county, in Vermont, W. of Bradford, containing 578 inhabitants.

Corinth, *Iſthmus of*, in *Ancient Geography*, the neck of land which joins Peloponneſus (the preſent Morea) to the upper part of Greece, and which is computed to be about ſix miles wide. As this forms an obſtacle to the paſſage from the Ionian to the Ægean ſea, it has been frequently propoſed to dig a canal through it, forming a junction between theſe ſeas, and thus preventing the circumnavigation of the Peloponneſus. Pliny, who mentions this project, and who, without being ſuperſtitious, repreſents it as a raſh attempt, alleges the unhappy end of four princes who ſet about it, *viz.* Demetrius of Phalera, Julius Cæſar, Caligula, and Nero. When Nero undertook this buſineſs, ſuperſtition diſcouraged the attempt; and it was ſaid, that, at the firſt ſtroke into the earth, blood guſhed out, that groans iſſued from the ſubterranean caverns, and that phantoms had appeared to the inhabitants of thoſe parts. Nero, however, deſpiſed theſe idle tales, and determined to proceed. He encouraged the Pretorian ſoldiers in their work by perſonal aſſiſtance, and flattering hopes of ſucceſs. The number of workmen whom he collected from all parts, and from all the gaols in the empire, was immenſe; and Veſpaſian, as Joſephus informs us, furniſhed him with 6000 Jews, ſelected from a much greater number whom he had impriſoned. The work was begun on the ſide next the Ionian ſea, at the port called Lecheum, and in 75 days an interval of four ſtadia was dug; and this was about the tenth part of the breadth of the iſthmus. On the laſt of theſe days, Nero ſent an order to diſcontinue the work. Two reaſons were alleged for this change of opinion and purpoſe. By ſome it was ſaid, that certain Egyptian mathematicians, whom the emperor had conſulted, having taken the level of the two ſeas, eaſt and weſt of Peloponneſus, found the waters of the Ionian higher than thoſe of the Ægean ſea; ſo that there was ground for apprehending that, if a communication were opened by a canal acroſs the iſthmus, the iſland of Ægina, and the low lands on the ſide of the Ægean ſea, would be overflowed and deſtroyed. But this allegation is a mere pretence; becauſe theſe two ſeas do actually communicate ſouth of Peloponneſus, and therefore their waters muſt be on a level. Conſidering the pertinacious temper and extreme vanity of Nero, it is very probable that he would have perſiſted, notwithſtanding every objection of mathematicians, if he had not been alarmed by reports from Italy, where diſturbances aroſe in conſequence of his abſence, and which made it neceſſary for him to return, ſo that he abandoned his enterpriſe. The news of a conſpiracy at Rome terrified him exceedingly, and haſtened his return. For an account of the games celebrated on this iſthmus, ſee Isthmian *Games*.

Corinth, *Gulf of*, now the *gulf of Lepanto*, commencing, as ſome of the ancients have ſaid, at the iſles called *Oxiæ*, having to the N. the mouth of the river Achelous and the Echinades, and to the S. the promontory called "Araxum Promontorium;" but, according to others, the gulf of Corinth denotes that portion of water forming a ſtrait to the S. by the point called "Rhium," and to the N. by that called "Anti-Rhium." This gulf extends eaſtward as far as Bœotia. In the interior part, it forms two ſmall gulfs; the one, advancing to the N., between parts of the Locride and Phocide territories, called, after the town of Criſſa to the N.E., "Criſſæus Sinus;" the other was formed by the moſt eaſtern part of the gulf, and was called "Alcyonium Mare."

CORINTHIAN Brass. See Æs *Corinthium*.

Corinthian *Order*, in *Architecture*. This is generally enumerated as the third of the Grecian orders, and forms the ultimate term of richneſs and elegance proper to that ſtyle of architecture.

The Corinthian order is principally diſtinguiſhed by its capital, which may be deſcribed as conſiſting of a bell-ſhaped body, covered with an abacus of a quadrilateral plan, with convex ſides; two tiers of leaves ſurround the lower part of the capital, between which little ſtalks or caulicoli riſe up to the corners of the abacus, and thoſe bending over form four volutes, and other volutes or ornaments occupy the centre of each ſide. Conſiderable varieties occur in ancient buildings; but this may be taken as a general analyſis, which will include all Corinthian capitals.

The account, given by Vitruvius, of the origin of this order, has been already detailed in the article *Civil* Architecture. It muſt, however, be obſerved, that the Egyptian buildings preſent many capitals of a bell-form, decorated with leaves, which bear a ſufficient reſemblance to the Corinthian capital, to juſtify a ſuſpicion that this compoſition may have been derived from the imitation of an Egyptian model.

Callimachus, to whom the invention of the Corinthian capital is attributed, is ſuppoſed to have lived about the 60th Olympiad, or 540 years before the Chriſtian æra, which would give a very high antiquity to this order; but the firſt diſtinct account we have been able to find of its introduction in any building, is the following from Pauſanias, l. viii. The ancient temple of Minerva at Tegea, in Arcadia, having been deſtroyed, a ſecond edifice was erected, under the direction of Scopas, far exceeding in ſplendour and magnificence every building of the kind in the Peloponneſus. In this ſtructure the three orders of architecture were employed. Within the encloſure were galleries ſupported by Doric and Corinthian columns, ſurrounding the hypætheos or open area of the cella; and on the outſide of the temple were porticoes of the Ionic order. This building may be dated in the fourth century B.C. To judge from the extant remains of this order in Greece, which are comparatively neither numerous nor important, we ſhould ſay, that it had never obtained a degree of favour equal to the other two orders; but in the buildings of Rome, and in works in other countries under Roman influence and direction, quite the contrary is the caſe; and it is to theſe ſources that we are to look for the beſt examples of the Corinthian order.

Vitruvius, l. 3. c. 1. in treating of this order, obſerves that Corinthian columns, excepting in their capitals, have their ſymmetry the ſame as the Ionic; but the height of the capital renders them proportionally taller, and more graceful: for the height of the Ionic capital is only a third part of the thickneſs of the column, whereas that of the Corinthian is the whole diameter of the ſhaft. The other members, which are placed above the column, are taken from the Doric or Ionic orders; for the Corinthian has no entablature peculiar to itſelf, but has either triglyphs, mutules in the cornice, and guttæ in the epiſtylium, as in the Doric manner; or elſe, according to the Ionic diſpoſition, the freize is ornamented, and dentils are placed in the cornice: ſo that by theſe two orders, joined with a different capital, a third order is produced.

The preceding obſervation of Vitruvius, that the Doric entablature was ſometimes applied to Corinthian columns, is in itſelf very extraordinary, and is not ſupported by any antique examples; but the remark reſpecting the Ionic entablature is found to be ſtrictly true in a number of inſtances, as we ſhall proceed to ſhew by the deſcription of the following examples:

A temple at Jackly, near Mylaſa. In this building there is a cornice, with dentils, a ſwelled freize, an architrave, with three plain facias, and an Attic baſe.

The arch of Adrian at Athens. A cornice, with dentils, a plain freize, an architrave, with two plain facias, and an Attic baſe.

A building called the Incantada at Salonicha, the ancient Theſſalonica. A cornice, with dentils, a ſwelled freize, ornamented with flutings, an architrave, with three plain facias, an Attic baſe.

The temple of Veſta at Tivoli. A plain cornice, with uncut dentil-band, an ornamented freize, an architrave, with two plain facias, and an Attic baſe.

The temple of Antoninus and Fauſtina at Rome. A plain cornice, with uncut dentil-band, ornamented freize, an architrave of two facias, divided by an Aſtragal, and an Attic baſe.

The portico of Septimius Severus at Rome. A plain cornice, with a ſmall uncut dentil-band, a plain freize, an architrave of three facias, divided by mouldings.

In all theſe inſtances, the entablature and baſe are entirely ſimilar to thoſe commonly obſerved in the Ionic order, from which thoſe Corinthian examples only differ in the form of the capital; but in the examples which remain to be cited, it will appear that the Romans attempted to give the Corinthian order a more diſtinct character, by appropriating to it a peculiar entablature and baſe, and thus made a complete order of what might be previouſly regarded, as Vitruvius appears to conſider it, in the light of a compoſite invention.

The Portico of the Pantheon. A cornice, with modillions, and an uncut dentil-band, a plain freize, an architrave of two facias, divided by mouldings, and a Corinthian baſe.

The temple of Peace at Rome. A cornice, with modillions and dentils, a plain freize, and an architrave of three facias, divided by mouldings.

The three columns of the Campo Vaccino, ſuppoſed to belong to a temple of Jupiter Stator. A cornice, with modillions and dentils, a ſtraight freize, an architrave of three facias, divided by mouldings, and a Corinthian baſe.

The temple of Jupiter Tonans at Rome. A cornice, with modillions and dentils, a ſtraight freize, and an architrave of three facias, divided by mouldings.

The arch of Conſtantine. A cornice, with modillions and dentils, a plain freize, an architrave of three plain facias, and an Attic baſe.

A temple at Epheſus, ſuppoſed by Chandler to be the temple erected, by permiſſion of Auguſtus, to the god Julius. A cornice, with modillions and dentils, a ſwelled and ornamented freize, an architrave of three facias, divided by mouldings, and an Attic baſe.

The temple at Niſmes called the Maiſon Quarré. A cornice, with modillions and dentils, a ſtraight freize, an architrave of three facias, divided by mouldings, and an Attic baſe.

To render this account of the progreſſive improvement in the Corinthian order more complete and ſatisfactory, ſome inſtances may be given, in which the alteration remains imperfect, having only taken place partially, with a great reſemblance to Ionic forms.

A portico at Athens, ſuppoſed by Stuart to be the ancient Poikile. This building preſents a cornice, with mutules of two ſquare faces, an architrave, with two plain facias, and an Attic baſe.

The frontiſpiece of Nero at Rome. A cornice, with mutules of the ſame form as the laſt mentioned, an ornamented freize, and an architrave of two facias, divided by an ogee.

In theſe two inſtances, there are no dentils or dentil-bands in the cornices; and the mutules, by their ſituation and ſhape, appear rather to be a variation from the proper Ionic dentil than a new member.

Conſidering the Corinthian order in its moſt complete ſtate, we find it poſſeſſed of a peculiar entablature diſtinguiſhed from that of the other orders by a cornice with modillions and dentils, a ſtraight freize, and an architrave of three facias divided by mouldings. The column is marked by its capital, and alſo by a peculiar baſe called the Corinthian BASE. This deſcription is wholly applicable to the three columns of the campo Vaccino, which are probably the moſt complete and beautiful examples of the order extant. See *Plate* 29.

Of the modern architects, who have treated of this order, Palladio makes the column $9\frac{1}{2}$ diameters high, and gives only one-fifth part of this altitude to the entablature, which conſiſts of a cornice with modillion and dentils, a ſtraight freize, and an architrave of three facias divided by Aſtragals. The baſe is Attic. Scamozzi's deſign bears a great general reſemblance to Palladio's, but he gives ten diameters to the column. The entablature is one-fifth of this height, the cornice has modillions, only the architrave conſiſts of three facias divided by Aſtragals, and the baſe is Attic. Serlio, in his Corinthian order, has followed Vitruvius in giving it an Ionic entablature with dentils, and in the proportion of the capital. The column is nine diameters high, and has a Corinthian baſe. Vignola's is a grand and beautiful compoſition in which he has chiefly imitated the three columns. He gives the column ten diameters in height with a Corinthian baſe. The entablature is one-fourth of the height of the column, the cornice has modillions and dentils; a plain freize, and an architrave of three facias divided by mouldings.

The following Table will exhibit the proportions of ſome of the principal examples of the Corinthian order, premiſing that the different members are meaſured by the diameter at the bottom of the ſhaft; which is divided into ſixty minutes.

	Height of Column.	Height of Capital.	Architrave.	Freize.	Cornice.

"The Corinthian order," ſays ſir William Chambers, "is proper for all buildings where elegance, gaiety, and magnificence are required. The ancients employed it in temples, dedicated to Venus, to Flora, Proſerpine, and the nymphs of fountains; becauſe the flowers, foliage, and volutes with which it is adorned, ſeemed well adapted to the delicacy and elegance of ſuch deities." This account, though plauſible in theory, is wholly unfounded, and is, in fact, a mere modern refinement. The Romans, in borrowing their architecture from Greece, appear to have particularly appropriated the Corinthian order, they found it poſſeſſed of an ornamental character adapted to the ſplendour and magnificence of their taſte, and uſed it indiſcriminately on all occaſions, and in the temple of any deity in the ſame manner that the early Greeks uſed the Doric, and the Ionians the Ionic order. Thus the Romans erected Corinthian temples to Jupiter, Neptune, and Mars; and the Greeks built the temples of the ſame deities of the Doric order. The temples of Minerva at Athens and at Sunium are Doric; the temple of Minerva at Priene is Ionic. The temple of Jupiter Olympius at Elis, was of the Doric order; the temple of the ſame god, erected by Adrian at Athens, is Corinthian. The orders of architecture are national. Thus the numerous temples of the Grecian colonies in Sicily and Italy are uniformly Doric, marked by the moſt ſevere and maſſy ſimplicity. The cities of Ionia preſent the beſt examples of a chaſte and elegant Ionic; while the magnificent ſtructures of Balbec and Palmyra, are wholly of the Corinthian order, and in the moſt florid ſtyle of ornament.

CORINTHIANS, *Epiſtles to the*, in *Biblical Hiſtory*, are two letters, addreſſed by the apoſtle Paul to the inhabitants of

Corinth, including both Gentile and Jewiſh converts, and comprehended in the ſacred canon of the New Teſtament. Some have inferred from 1 Cor. v. 9, that the apoſtle had written another epiſtle to the church at Corinth; but Dr. Whitby (*in loc.*) obſerves, that no fathers ever aſcribed to St. Paul more than 14 epiſtles, including that to the *Hebrews;* nor does Euſebius mention any third epiſtle to the Corinthians, amongſt the true, controverted, or ſpurious writings which paſs under his name. Moreover, no Chriſtian writer ever cited any thing from this ſuppoſed epiſtle; and all the Greek ſcholiaſts declare, that the apoſtle ſpeaks in theſe words, "not of another, but of this very epiſtle," which, ſays Dr. Whitby, "is ſufficient to juſtify the verſion I have given of theſe words, I had written, or was writing, in this epiſtle." Beſides, his ſuppoſed epiſtle to Laodicea is cited as a book exploded by St. Jerom; his epiſtles to Seneca are in like manner cited by St. Jerom and St. Auſtin; the acts of Paul are cited, and rejected by Origen and Euſebius; but none of them make any mention of more than two epiſtles to the church of Corinth.

The *firſt epiſtle* was written about three years after the apoſtle had left Corinth, to preach the goſpel in other parts of Greece; and it was written at Epheſus, as appears from ch. xvi. 8, 9, 19, and Acts, xviii. 18, 19, according to Pearſon and Mill in the year 57, the third of the emperor Nero; but, according to Lardner's computation of St. Paul's times and travels, in the ſpring of the year 56, and this was alſo the opinion of Lenfant and Beauſobre. This epiſtle was written in anſwer to ſome important inquiries propoſed by the Corinthians, and for the purpoſe of correcting the various irregularities and diſorders, of which they were guilty. The firſt article under the head of abuſes, with which they were chargeable, related to the parties and factions into which they had fallen, and the oppoſition which was made by ſome of them to St. Paul's apoſtolical miſſion. The firſt four chapters comprehend this firſt head. The ſecond topic which the apoſtle conſiders was the caſe of a notorious offender in the Corinthian church, who had been guilty of moſt ſcandalous inceſt with his father's wife. (See chap. v.) The third article which the apoſtle exhibits againſt the Corinthians is, that by a covetous and litigious temper they were led, in violation of the rules of Chriſtian prudence and charity, and ſometimes in oppoſition to the principles of juſtice, to proſecute their brethren in the heathen courts. (Chap. vi. 1—11.) In the fourth place, the apoſtle cautions them againſt the ſin of fornication, to which, in their Gentile ſtate, they had been much addicted, and which ſome ſeem to have reckoned among things that were indifferent, or to conſider as of inferior enormity; introducing uſeful reflections on matters of indifference, and illuſtrating the heinous evil of fornication from views peculiar to the Chriſtian religion. (Chap. vi. 12. to the end.) As Corinth was conveniently ſituated for commerce, it abounded in riches, and was furniſhed with all the accommodations, elegancies, and ſuperfluities of life. Hence, by too natural a conſequence, the inhabitants were led into luxury, lewdneſs, and all manner of vice; ſo that they became infamous even to a proverb. Thus, Κορίνθια γυνή, a Corinthian woman, is, in the language of the ancients, a lewd proſtitute, according to the proverb (cited in Eraſm. Adag. Cent. 7. p. 633. 720.) ἆ κόρινθια ἔοικας χοιροπωλήσειν, *at Corinthia videris corpore quæſtum factura.* And Κορινθιάζειν, Κορινθιάζεσθαι, is ἑταιρεύειν, *ſcortationibus indulgere.* (Heſych. Phavor.) We have already obſerved (from Strabo) that there was in it a temple dedicated to Venus, which πλείους ἢ χιλίας ἱεροδούλους ἐκέκτητο ἑταίρας. See CORINTH.

Having thus largely, and with great fidelity and plainneſs, corrected ſome lamentable diſorders which prevailed among the Corinthians; the apoſtle proceeds to the other principal object of his epiſtle, which was to anſwer certain queſtions which they had propoſed to him. Here he determines, *firſt*, thoſe which related to the marriage-ſtate; ſtating, that in ſome circumſtances this ſtate ſhould be entered into, and continued in; but in others, foreborne, particularly at that time; and enjoining wives not to depart from their huſbands, and huſbands not to diſmiſs their wives. (Ch. vii. 1—11.) He then ſhews, that marriages were not to be diſſolved, as ſome thought they might, on account of a difference in religion; and he urges contentment with the ſtations, in which they were called, whether they were married or ſingle, bond or free. (v. 12—14.) And with regard to ſingle perſons, he aſſerts the inexpediency of their marrying in the peculiar circumſtances of the church at that juncture. (v. 25, to the end.) To the *ſecond* query propoſed, *viz.* how far they might comply with their heathen neighbours in "eating things ſacrificed to idols," he replies, by reminding them that though all Chriſtians might well be ſuppoſed to know the vanity of thoſe imaginary deities, to which the ſacrifices were offered, yet it might prove an occaſion of grief and ſcandal to ſome, if the profeſſors of Chriſtianity ſhould partake of thoſe ſacrifices in their temples; which, therefore, Charity would require them by all means to avoid. (Ch. viii.) He then, after waving, for his own part, the expectation of a maintenance from the Corinthians, ſtates the right, which, as a miniſter of the goſpel, he really had to be ſupported by thoſe among whom he laboured; and this he argues both from natural equity, and ſcripture-principles. (Ch. ix. 1, to the end.) He next reſumes the argument againſt partaking of entertainments upon "things offered to idols" in the heathen temples. (Ch. x. 1—13.) He proceeds to caution them againſt all approaches to idolatry. (v. 14, to the end, ch. xi. 1.) In reply to a *third* query, concerning the manner in which women ſhould deliver any thing in public, when urged to it by a divine impulſe, he firſt ſettles this point; he then conſiders various circumſtances relating to public worſhip, and guards againſt abuſes in the celebration of the Lord's ſupper, and alſo in the exerciſe of ſpiritual gifts; concluding with a recommendation and deſcription of mutual charity. (Ch. xi. 2, to the end, ch. xii. ch. xiii. Ch. xiv.) As ſome of the Corinthians doubted, and others denied, the reſurrection of the dead, the apoſtle eſtabliſhes this great and peculiar article of the Chriſtian faith. (Ch. xv.) He then cloſes the whole with ſome neceſſary counſels to the Corinthian churches and exhortations to fortitude and charity. (Ch. xvi.)

The *ſecond epiſtle* of St. Paul to the Corinthians was written during his ſtay in Macedonia, whither he had gone from Epheſus, ſomewhat more than a year after his former epiſtle; according to Pearſon in the year 57, and as Mill ſuppoſes near the end of that year; or, as Dr. Lardner ſuggeſts, in September or October. (Ch. ix. 1—5. ch. viii. ch. xiii. 1.) It was conveyed by Titus, who was returning to Corinth in order to forward the collection intended for the poor Chriſtians in Judea. Its evident deſign is, in general, to illuſtrate ſome of the ſame points upon which he had diſcourſed in the former, according to the information which the apoſtle had received from Titus concerning the circumſtances and temper of the Corinthian church; and the writer interſperſes and enforces ſome occaſional reflections and advices upon various ſubjects, which he thought moſt conducive to their inſtruction and edification. From a view of the epiſtle it is evident, that a great part of it is employed in reclaiming the Corinthian church from their undue attachment to Judaizing teachers, and from that party-ſpirit, which they had indulged, and in rekindling proper regards to the unadulterated doctrine of the goſpel, and to his own apoſtolical counſels. This leading deſign of the epiſtle is interrupted by the occaſional introduction of other matters, which can form no reaſonable objection to the accuracy and beauty of this excellent compoſition; for the tranſitions ariſe from ſome obvious and important ſentiments, which render them natural and juſt. In theſe digreſſions there is an admirable wiſdom; becauſe they relieve the minds of the Corinthians from that uneaſineſs, which they muſt have felt from a conſtant attention to ſo diſagreeable a ſubject as their unſuitable conduct towards the apoſtle himſelf. It is with the ſame kind of propriety and ſagacity, that the ſevere intimations, which the dignity of the apoſtolic character obliged St. Paul to drop againſt thoſe, who might perſevere in their oppoſition, are reſerved to the cloſe of the epiſtle; as they would feel with additional weight, in all probability, after their minds had been ſoftened with the reiterated expreſſions of his tender affection to the Corinthians in general, and the innocence and amiableneſs of his character had been repreſented in ſuch a variety of views. See Doddrige's Expoſition, vol. iv. Whitby's Comment. vol. ii.

We cannot cloſe this article, without referring to ſome pertinent and judicious remarks, made by archdeacon Paley, in his "Horæ Paulinæ," (an excellent work of original criticiſm and reaſoning,) on the undeſigned agreement or conformity that is manifeſt between theſe letters of St. Paul to the Corinthians, and the hiſtory of his life and travels in the book of Acts.

As it appears, from chap. vii. v. 1. that the firſt epiſtle was written to the Corinthians, in anſwer to one which he had received from them, this alone is a circumſtance that favours the authenticity of the epiſtle:—for it muſt have been a far-fetched contrivance in a forgery, firſt to have feigned the receipt of a letter from the church of Corinth, which letter does not appear; and then to have drawn up a fictitious anſwer to it, relative to a great variety of doubts and inquiries, purely economical and domeſtic; and which, though likely enough to have occurred in an infant ſociety, in a ſituation and under an inſtitution ſo novel as that of a Chriſtian church then was, it muſt have very much exerciſed the author's invention, and could have anſwered no imaginable purpoſe of forgery, to introduce the mention of at all. Particulars of this kind are ſuch as follow:—the rule of duty and prudence relative to entering into marriage, as applicable to virgins, to widows—the caſe of huſbands married to unconverted wives, of wives having unconverted huſbands—the caſe where the unconverted party chuſes to ſeparate, when he chuſes to continue the union—the effect which their converſion produced upon their prior ſtate, of circumciſion, of ſlavery—the eating of things offered to idols, as it was in itſelf, as others were affected by it—the joining in idolatrous ſacrifices—the decorum to be obſerved in their religious aſſemblies, the order of ſpeaking, the ſilence of women, the covering or uncovering of the head, as it became men, as it became women. Theſe ſubjects, with their ſeveral ſubdiviſions, are ſo particular, minute, and numerous, that though they be exactly agreeable to the circumſtances of the perſons to whom the letter was written, nothing but the exiſtence and reality of theſe circumſtances could have ſuggeſted to the writer's thoughts. Another particular deſerving of notice is, that in this correſpondence the Corinthians did not ſay one ſyllable about the enormities and diſorders which had crept in among them, and in the blame of which they all ſhared; but that the apoſtle's information, concerning the irregularities then prevailing at Corinth, had come round to him from other quarters. (Ch. i. 11, 12. v. 1, 2.) That the Corinthians ſhould, in their own letter, exhibit the fair ſide of their conduct to the apoſtle, and conceal from him the faults of their behaviour, was extremely natural, and extremely probable; but it was a diſtinction which would not have eaſily occurred to the author of a forgery; and much leſs likely is it, that it ſhould have entered into his thoughts to make the diſtinction appear in the way in which it does appear, *viz.* not by the original letter, not by any expreſs obſervation upon it in the anſwer, but diſtantly by marks perceivable in the manner, or in the order, in which St. Paul takes notice of their faults. For the particular traces of unintended and ſeemingly accidental coincidence between the facts that are recited in the two epiſtles, and thoſe that may be collected from the hiſtory, and which is altogether irreconcileable with a premeditated impoſture or forgery, we muſt refer the reader, converſant with ſubjects of this kind, and deſirous of farther information, to the work already cited, p. 72—151.

We may here obſerve, that there is another epiſtle of St. Paul to the Corinthians, beſides the two above mentioned, purporting to be an anſwer to an epiſtle from the Corinthians to him. This was tranſlated by Scroderus, from a copy in the Armenian language, which had been ſent to Mr. Whiſton, and was afterwards, from a more perfect copy procured at Aleppo, publiſhed by his ſons, as an appendix to their edition of Moſes Chorenenſis. No Greek copy exiſts of this epiſtle: it is not only unſupported by ancient teſtimony, but negatived and excluded; as it has never found admiſſion into any catalogue of apoſtolical writings, acknowledged by, or known to, the early ages of Chriſtianity. This epiſtle is an artful and ſpecious forgery, introduced with a liſt of names of perſons who wrote to St. Paul from Corinth, and preceded by an account, ſufficiently particular, of the manner in which the epiſtle was ſent from Corinth to St. Paul, and the anſwer returned. But they are names which no one ever heard of, and the account it is impoſſible to combine with any thing found in the Acts, or in the other epiſtles.

CORINTHUS, in *Ancient Geography*, a town of Greece, in Theſſaly.—Alſo, a town of Greece, in Epirus.

CORIO, in *Geography*, formerly a town of Piedmont, in Italy, belonging to the king of Sardinia, is now a town of France, in the department of the Po, chief place of a canton, in the diſtrict of Turin, containing 5132 inhabitants. The canton is compoſed of 5 communes, and reckons in all 6764 inhabitants.

CORIOLANO, Christofano, in *Biography*, a deſigner and engraver in wood, who is ſaid to have been a native of Nuremberg, but who afterwards eſtabliſhed himſelf at Venice. Heinecken conjectures that his real name was that of *Lederer*, a family ſtill exiſting in Saxony, and which Chriſtofano might tranſlate into Coriolano, according to the cuſtom of thoſe times.

Vaſari informs us, in his Life of Marc Antonio, that Chriſtofano engraved, from the deſigns of himſelf and his ſcholars, all the portraits prefixed to the lives of the different painters, ſculptors, and architects, in his extenſive work; and that he continued to enjoy the reputation of an excellent artiſt at Venice, where he was eſtabliſhed. If ſo, Chriſtofano Coriolano cannot have been born ſo late as 1560, which M. Huber ſuppoſes. Beſides the prints for Vaſari, many of thoſe in the *Ars Gymnaſtica Hieronymi Mercurialis*, the work of Ulyſſes Aldrovandini, are attributed to this maſter. But it is probable there were two artiſts of the ſame name. Huber.

Coriolano, Cav^{r}. Bartolommeo, ſuppoſed the ſon of the preceding artiſt, was born at Bologna, about 1590, and is ſaid to have perfected himſelf in deſign by ſtudying in the academy of Caracci. Guido, however, ſeems to have been the painter he moſt admired; and we are indebted to Bartolommeo for ſeveral excellent engravings in chiaro-ſcuro, from the drawings of that graceful painter. Theſe prints were produced, like thoſe of Ugo de Carpi and Andrea Andreani, by means of three blocks of wood; one of which gave the outlines and the greateſt depths of ſhadow, as if hatched with a pen; the ſecond, the middle tints; and the third, the darker maſſes. He flouriſhed from 1620 to 1650. His prints are generally ſigned with his name, or with his initials, thus, B. C. Eques.

Amongſt his beſt prints are the following: "St. Jerome before a Crucifix," a half-length figure, dated 1636, after Guido; "the Daughter of Herodias, with the Head of John the Baptiſt," from the ſame; "the Fall of the Giants," a large upright print on four ſheets, from the ſame painter, dated 1647, and conſidered the chef d'ouvre of Coriolano. Heinecken. Huber.

Coriolano, Gio. Batista, the younger brother of Bartolommeo, was born at Bologna, about 1596, and ſtudied painting and deſign under Gio. Luigi. Valeſio. Some of the pictures of Gio. Batiſta exiſt in the churches of St. Anna and the Annonciata, at Bologna. He is better known by his numerous engravings in wood and copper, the former of which are preferred by the connoiſſeurs.

We ſhall only notice the following prints by this artiſt, who is ſaid to have died in 1649: "the Portrait of Fortunatus Licetus," 1639, in 4to.; "Chriſt crowned with Thorns," a middling-ſized upright plate, boldly etched from Lod. Caracci. Huber.

Coriolano, Teresa Maria, ſiſter to the two preceding artiſts, after having acquired ſufficient knowledge of deſign from the inſtructions of her father, ſtudied painting under Elizabetta Sirani. She alſo amuſed herſelf with etching, as appears by a ſmall print repreſenting the Virgin and Child. Huber.

CORIOLANUS, **Caius Marcus**, celebrated in Roman hiſtory, was deſcended from the family of the Marcii, and in his early years he diſplayed uncommon courage and nobleneſs of mind, united with ſtrong paſſion and the pride of high birth. He firſt diſtinguiſhed himſelf in the war againſt Tarquin, who was expelled; and obtained a civic crown, for having preſerved the life of a fellow-citizen. For his ſucceſs over the Volſcians, he was preſented with a fine horſe richly capariſoned, and a tenth part of the ſpoil. The former he accepted, but diſdained a greater ſhare of the booty than fell to his lot in common with others of the ſame rank. As a further favour, he demanded the releaſe of a Volſcian priſoner, who had been connected with him by the tie of friendſhip, which was immediately granted; and the ſurname of Coriolanus was unanimouſly conferred upon him, on account of his great ſervices in the capture of Corioli, the capital of the Volſcians, which happened in the year 493 B. C. About this time diſſenſions prevailed between the patricians and plebeians: Coriolanus ſided with the former, and was exceedingly ſevere againſt the plebeians. For ſome of his meaſures he was ſummoned before the tribunes, to which he paid no attention, till he conceived the ſafety of the ſtate required him to come forward in his own juſtification. Inſtead, however, of ſoftening the reſentment of the people by ſubmiſſion, he aggravated their diſpleaſure by the haughtineſs of his behaviour. He was now condemned to be thrown from the Tarpeian rock; but from this ſevere puniſhment he was ſaved by the courage of the patricians, in whoſe cauſe he had embarked. He was at length tried by the people, to whom he appealed by the ſcars he had received in fighting for his country, and by the lives he had ſaved in battle; but the tribunes ſucceeded in obtaining againſt him a ſentence of perpetual baniſhment. He heard the decree without emotion, and with a manly compoſure took leave of his mother, his wife, and children; but the ingratitude of his country made an indelible impreſſion on his mind. He was bent on revenge: he joined with the enemies of Rome, took many of the towns, and encamped within five miles of the city itſelf. The people now ſaw their error, and a deputation was ſent out to treat with him: he received them with haughtineſs, but would give them no hopes of a reconciliation. To a ſecond and third meſſage of the ſame kind he ſhewed himſelf inexorable. At length, his mother, wife, and children, came out to plead their country's cauſe. To their intreaties he could no longer refuſe his ear. Raiſing his venerable parent from the ground, on which ſhe had proſtrated herſelf, he exclaimed, "You have ſaved Rome, my mother, but you have deſtroyed your ſon." He retired to his tent, and ſoon after took meaſures for a retreat. When he had brought back the troops to the Volſcian country, he divided all the booty among the ſoldiers; on which account he ſo ingratiated himſelf with the men, that his own want of reſolution was forgotten. By ſome of the hiſtorians we are told he lived to a great age; though others maintain that he was ſlain in a tumult, excited againſt him for yielding to the prayers of his country. Plutarch.

CORIOLLA, **Corioli**, in *Ancient Geography*, a town of Italy, ſituated in the country of the Volſci, of which it was the metropolis. From this town, which no longer ſubſiſted in the time of Pliny, Marcius took the name of *Coriolanus*.

CORIOS, a river of Aſia, towards Carmania.

CORIOTRAGEMATODENDRON, in *Botany*, Pluk. See **Myrica** *quercifolia*.

CORIOVALLUM, in *Ancient Geography*, a town of Belgic Gaul, on the route from Colonia Trajana, between Teudurum and Juliacum. Anton. Itin.

CORIS, in *Botany*, (κορις; Dioſc.) Tourn. 652. Append. Linn. gen. 243. Schreb. 329. Willd. 374. Lam. Ill. 292. Juſſ. 96. Vent. 2. 288. Claſs and order, *pentandria monogynia*. Nat. Ord. *Lyſimachiæ*, Juſſ. *Primulaceæ*, Vent.

Gen. Ch. *Cal.* one-leafed, ventricoſe, five-toothed, crowned externally with ſtrong ſharp briſtles. *Cor.* monopetalous, irregular; tube the length of the calyx, cylindrical; border flat, five-parted; ſegments oblong, obtuſe, emarginate, unequal. *Stam.* five, briſtle-ſhaped, ſhorter than the corolla, declining; anthers roundiſh. *Piſt.* Germ ſuperior, roundiſh; ſtyle filiform, the length of the ſtamens; ſtigma ſimple. *Peric.* Capſule globular, placed at the bottom of the calyx, one-celled, five-valved. *Seeds* numerous, ſomewhat egg-ſhaped, ſmall.

Eſſ. Ch. Calyx ventricoſe, with thorn-like teeth. Corolla monopetalous, irregular. Capſule five-valved, included in the calyx.

Sp. C. *monſpelienſis*. Linn. Sp. Mart. Lam. Ill. Pl. 102. Willd. (C. cærulea maritima; Bauh. Pin. 280. Symphytum petræum; Cam. Epit. 699.) *Root* perennial. *Stems* ſeveral, about ſix inches high, more or leſs erect, cylindrical, branched, cinereous, or reddiſh. *Leaves* ſcattered, numerous, ſmall, linear; the upper ones in the wild plant edged with ſharp prickly teeth. *Flowers* red or white, in denſe, egg-ſhaped, terminal ſpikes. A native of ſandy ſhores in the ſouth of Europe.

Coris *lutea*; C. Bauh. See Hypericum *coris*.

Coris is alſo uſed in the Eaſt Indies for a kind of ſhells which paſs for money. See Bia and Cowry.

CORISCO, in *Geography*, two iſlands of that name on the coaſt of Guinea, belonging to Benin.

CORISPERMUM, in *Botany*, (from κορις, *a bug*, and σπερμα, *ſeed*.) Linn. Gen. 12. Schreb. 16. Willd. 26. Gært. 469. Lam. Illus. 12. Juſſ. 86. Vent. 2. 261. Claſs and order, *monandria digynia*. Nat. Ord. *Oleraceæ*, Linn. *Atriplices*, Juſſ. *Chenopodæ*, Vent.

Gen. Ch. *Cal.* none; Linn. Schreb. Willd. (two-leaved; leaves oppoſite, compreſſed, acuminate, incurved; Lam. Juſſ. Vent. Gært.) *Cor.* dipetalous; Linn. (none, Lam.) *Stam.* Filament one, but in the lower flowers often from two to five, filiform; anther roundiſh. *Piſt.* Germ ſuperior, egg-ſhaped, compreſſed; ſtyles two, capillary (one; Gært.) ſtigmas acute. *Peric.* none. *Seed* ſingle, oval, compreſſed, flat or a little concave on one ſide, convex on the other, with an acute margin.

Eſſ. Ch. Calyx or corolla two-leaved, or two-petalled, one of them wanting. Seed ſingle, elliptical, plano-convex, with an acute margin.

Sp. 1. C. *hyſſopifolium*. Linn. Sp. Pl. 1. Mart. 1. Lam. 1. Willd. 1. Lam. Illus. Pl. 5. "Flowers lateral; bractes like the leaves, linear, ſmooth underneath." *Root* annual. *Stem* ſcarcely a foot high, pubeſcent towards the top, reddiſh beneath, ſtriated, branched. *Leaves* alternate, entire, with a white longitudinal nerve, and ſomewhat membranous edges; lower ones two inches long, about a line broad, ending in a long point, diminiſhing gradually towards the top of the ſtem, without aſſuming the form of bractes. *Flowers* axillary within the upper leaves, ſeſſile. *Seeds* emarginate. A native of Ruſſia and the ſouth of France. 2. C. *ſquarroſum*. Linn. Sp. 2. Mart. 2. Lam. 2. Willd. 2. "Spikes lateral and terminal, ſquarrous; bractes egg-ſhaped, ſhort, mucronate, ſomewhat villous." *Root* annual. *Stem* a foot high or more, much branched, panicled, zigzag, cylindrical, almoſt ſmooth, greeniſh, with purple ſtriæ; lower branches almoſt decumbent. *Leaves* about two inches long, alternate, linear, ſmooth, nearly equally diſtant from each other. *Spikes* an inch long or more; bractes very different from the leaves, with white membranous edges; flowers ſeſſile. *Seeds* not emarginate. A native of Tartary and Siberia. There is a variety, perhaps a diſtinct ſpecies, found in the ſouth of France, with weaker ſtems and more ſlender generally terminal ſpikes. 3. C. *orientale*. Lam. 3. "Leaves long, narrow, linear; flowers ſomewhat panicled, growing only at the ends of the branches." *Root* annual. *Stems* about a foot high, ſlender, reddiſh at the baſe, branched. *Leaves* narrowing towards the baſe. *Bractes* ſmall, oblong, villous. A native of the Levnat.

Corispermum *foliis oppoſitis*; Fl. lap. Gron. See Callitriche.

CORITA, in *Geography*, a town of Spain, in the province of Leon; 17 miles S.S.W. of Leon.

CORITANI, or Coriceni, inhabitants of ancient Albion, were ſituated to the W. and N. of the Iceni, and, according to Camden, were the ancient inhabitants of the country, which is now divided into Northamptonſhire, Leiceſterſhire, Rutlandſhire, Lincolnſhire, Nottinghamſhire, and Derbyſhire. Other antiquaries, however, are of opinion that their territory was not ſo extenſive. The name of the Cor-Iceni plainly indicates that there was ſome kind of affinity or connection between them and their neighbours, the Iceni. Some think they were two tribes of the ſame nation, and that Cor-Iceni denotes the leſſer Iceni, from *Carr*, a dwarf, and Iceni. Others imagine that both theſe Britiſh tribes derived their name from the different kinds of animals which conſtituted their chief riches, and the tending of which was their chief employment; the Iceni from *Uchen*, oxen; and the *Cor-Iceni*, from *Cor*, a ſheep. However this be, if the two tribes did not form one nation, they were in very ſtrict alliance, and ſhared the ſame fate; having been both reduced to ſome degree of ſubjection to the Romans by Oſtorius Scapula, and totally ſubdued by Suetonius Paulinus. The Romans made great changes in the country of the Cor-Iceni, by introducing agriculture, and by building many forts and ſtations in it to keep them in ſubjection. Lindum, now Lincoln, the ancient capital of the Cor-Iceni, became the ſeat of a Roman colony, and one of the moſt conſiderable cities which theſe people had in Britain; and it is mentioned both by Ptolemy and by Antoninus in both his journies. By following the courſe of the 6th journey of Antoninus, from London to Lincoln, we meet with a conſiderable number of Roman towns and ſtations within the territories of the Cor-Iceni; as Venonæ, now Clayceſter; Ratæ, now Leiceſter; Virometum, now Willoughby; Margidunum, now Eaſt-Bridgeford; Ad-Pontem, now Southwell; and Crocoiana, now Brugh, near Cottingham. The extenſive country of the Cor-Iceni was included in the Roman province called Britannia Prima.

CORITHUS, or Corythus, a town and mountain of Italy, in Etruria, according to Servius on Virgil; but Cluvier thinks that Servius is miſtaken; and that if ſuch a place exiſted, it muſt have been in the country ſince called Cortona.

CORITIUM, a town of Aſia, towards Syria; placed near the Euphrates by William of Tyre.

CORITUS, a mountain of Italy in Umbria; now Monte Corvo.

CORIUM, a place in the iſle of Crete, near the lake or marſh called Coreſium.

CORIUNDI, a people of Hibernia, according to Ptolemy.

CORIUS, a river of Carmania.

CORIZENSIS, an epiſcopal ſee of Aſia, in the patriarchate of Antioch.

CORIZIOLA, in the *Materia Medica*, is a name given by ſome authors, particularly by Rhaſis, to the ſcammony.

CORK, the exterior bark of a tree belonging to the genus of oak (Quercus *Suber*), which grows wild in the ſouthern parts of Europe, particularly France, Spain, Portugal, and Tuſcany. When the tree is about 15 years old, it is fit to be barked, and this can be done ſucceſſively for eight years. The bark always grows up again; and its quality improves as the age of the tree increaſes. If care is not taken to ſtrip the bark, it ſplits and peels off by itſelf, being puſhed up by a ſecond growth forming under that of the preceding year.

Stripping and preparing the Bark.—The bark is taken off by the Portugueſe in ſheets or tables, by cutting it with knives having two handles, ſimilar to thoſe which the tanners or ſkinners uſe at their beam, or horſe, ſlitting it down after the circular inciſion is made, from top to bottom; to effect this inciſion they aſcend the tree by a ladder to the part where the branches ſpring from the top; they then make a ſlice or ſlip: the filaments connecting the bark with the trunk are next cut down, or through, by a knife formed like our hay-ſpade, and which they uſe in nearly the ſame manner: the bark is frequently, through haſte, broken off at the root, in which caſe the two ends are diſtinguiſhed by the appellations of "cut end" and "faſt end;" the firſt is that which had been at the top of the tree, where the circular cut was firſt made, and the ſecond is that which had been next the ground.

Another mode of accompliſhing the artificial ſtripping of the tree, is thus performed: ſeveral inciſions are made from the top of the trunk to the bottom, and at each extremity of theſe inciſions a circular cut is effected; by this operation the bark is cut off from communication with either the lower or higher parts of the tree; conſequently it is entirely deprived of ſupport; in a little time it looſens, and its ſeparation is completely accompliſhed by the hand; thus the progreſs of nature is expedited by very ſimple means. Before the operation of barking is again performed upon the ſame tree, ſhould it be a young one, it ought to ſtand three years; it is not however unfrequently cut within the period; when it is cut too young, it is generally preſerved by the Engliſh cork-cutter in his cellar till it alters from green to the colour proper for his purpoſe, which is effected merely from the time he keeps it in that ſtate, though after all, it is ſtill much inferior to that taken when the tree has arrived at maturity.

After being detached from the tree, the Portugueſe "burn it;" laying the convex ſide of the bark to the fire; in this operation they are careful to cover all the blemiſhes they poſſibly can, holes are filled up in an inſufficient manner either by the ſwelling and ſtraightening of the wood upon the fire, or by the artful introduction of ſoot and dirt. When the judgment of the burner is ſufficiently exerciſed in flattening the bark, and artificially repairing its defects, it is laid into the farm yard for ſale, in ſtacks, and bought by the merchants from thence for exportation.

Another method uſed in ſtraightening the bark, is to pile it up in pits, loaded with heavy ſtones, by which method it becomes flat, this is afterwards more completely effected in a damp cellar, and is called "laying the cork;" when this operation is finiſhed it is dryed over a ſtrong fire in what is called "a burning yard;" from negligence in this proceſs it receives too much of that black colour which is ſo frequently diſcovered in articles made of cork: when ſufficiently dryed it is ready for ſtacking.

The cork is not burnt, but only charred on each ſurface; previous to this operation the pores of the bark are open, and its conſequent ſpongineſs of texture would make it not only give too much way to the knife; but particularly in the caſe of "taps" and "bungs" would render it a filter, rather than a preſerver, of liquids. It ſhrinks with the application of moderate heat, and thereby cloſes the pores, by which any filtration might be effected. If "burning" ever be uſed as a cover for defects, it is not an original deſign but an accidental advantage, which is taken of a neceſſary proceſs; "bungs" and "taps" are always charred on both ſurfaces; good bottle corks, though the bark of which they are made is likewiſe ſubjected to the operation of fire, do not after they are cut exhibit any marks of that element, being cut in the length way of the wood, the pores lie in a contrary direction, and the charring conſequently is taken off by the proceſs of rounding them.

The cork tree as well as the uſes to which the bark is applied, &c.—This tree, as well as its uſe, was known to both the Greeks and Romans. By the former it was called *phellus.* Theophraſtus reckons it among the oaks, and ſays, that it has a thick fleſhy bark, which muſt be ſtripped off every three years to prevent it from periſhing. He adds, that it was ſo light as never to ſink in water, and on that account might be uſed with great advantage for a variety of purpoſes. That the *ſuber* of the Romans was our cork-tree is generally and juſtly admitted. Pliny relates of it every thing ſaid by Theophraſtus of the *phellus;* and from his account we learn, that at the period when he wrote, cork was applied to as many purpoſes as at preſent. At that time fiſhermen made floats to their nets of cork; that is, they affixed pieces of cork to the rope which formed the upper edge of the net, in order to keep it at the ſurface of the water. Another uſe to which cork was applied, according to Pliny, was for anchor-buoys. "Uſus ejus ancoralibus maxime navium:" that is, as this paſſage may be interpreted, it was uſed for making buoys, called "Ancoralia," which were fixed to the cable, and by floating on the ſurface of the water, over the anchor, pointed out the place where it lay. Our navigators uſe for that purpoſe a large but light block of wood, which, in order that it may float better, is often made hollow. See Buoy.

Another uſe of cork among the Romans was for being made into ſoles, which were put into their ſhoes, in order to ſecure their feet from water, eſpecially in winter; and, as high heels were not then introduced, they ſerved the purpoſe of elevating ladies and making them appear taller than they naturally ſeemed. The practice of employing cork for jackets to aſſiſt in ſwimming is alſo very ancient; for we are informed, that the Roman whom Camillus ſent to the capitol when beſieged by the Gauls, put on a light dreſs, and took cork with him under it, becauſe, to avoid being taken by the enemy, it was neceſſary that he ſhould ſwim through the Tiber. When he arrived at the river, he bound his clothes upon his head, and placing the cork under him, was ſo fortunate as to ſucceed in his attempt. The moſt extenſive and principal uſe of cork at preſent is for ſtoppers to bottles. To this purpoſe it is excellently adapted; becauſe it is very light, may be eaſily compreſſed, and expands again by its elaſticity as ſoon as the preſſure upon it is removed, and, therefore, it fills and ſtops up very cloſely the ſpace into which it has been driven by force. Beſides, it may be eaſily cut into all forms; and though it abounds with pores, which are the cauſe of its lightneſs, it ſuffers neither water, beer, nor any common liquid to eſcape through it, and it is but ſlowly and after a conſiderable interval that it can be penetrated even by ſpirits; its numerous pores ſeem to be too ſmall to afford a paſſage to the fineſt particles of water and wine, which can with greater facility ooze through more compact wood that has larger or wider pores. This uſe of corks was not altogether unknown to the Romans; for Pliny expreſsly ſays, that it ſerved to ſtop veſſels of every kind, and inſtances of its being employed for that purpoſe may be ſeen in Cato (De Re ruſtica, cap. 120.) and Horace (lib. iii. od. 8. 10.); its application to this uſe does not ſeem, however, to have been very common as other ſubſtances have been generally employed for this purpoſe. Stoppers of cork ſeem to have been firſt introduced after the invention of glaſs bottles, of which no mention occurs before the 15th century. See Bottles.

This wood is ſtill formed into ſoles for ſhoes, into corks and bungs for ſtopping bottles, &c. into a floatage for the nets of fiſhermen; it is employed generally, though perhaps with a conſiderable degree of error in teaching the art of ſwimming; it is alſo ingeniouſly uſed on account of its lightneſs, when an amputation of the human leg has been neceſſary, to ſupply the deficiency; the Spaniards line ſtone walls with it, which not only renders their houſes very warm but corrects the moiſture of the air; the Egyptians made coffins of it, which being covered in the inſide with a reſinous compoſition

poſition preſerved their dead bodies. It is burnt to make that light black ſubſtance, called Spaniſh black, from its having been firſt made in Spain.

Cork bark has not only been applied as above, but alſo in the preſervation of life, when endangered by ſhipwreck; the moſt conſpicuous exhibition of its advantages is in the application of it in the conſtruction of the "life boat" or "cork boat," as it was originally called. We have under the article *boat*, "*life boat*," given our readers a ſhort account of that ineſtimable invention; ſince which we have procured a very valuable account by the principal ſecretary of the meeting who firſt advertiſed the reward; we have alſo obtained from the liberality of Mr. Greathead, and the intereſt of the gentleman alluded to, a plan or ſection of the boat, drawn by the original inventor, which will be given under the article Life *Boat*.

A cork jacket too has been revived from an old German diſcovery, by Mr. Dubourg; to preſerve the lives of perſons in danger of drowning, which is conſtructed as follows. Pieces of cork about three inches long, by two wide, and the uſual thickneſs of the bark, are incloſed between two pieces of ſtrong cloth or canvas and formed like a jacket without ſleeves; the pieces of cloth are ſewed together round each piece of cork, to keep them in their proper ſituations; the lower part of the jacket about the hips is made like the ſame part of women's ſtays, to give freedom to the thighs in ſwimming; it is made ſufficiently large to fit a robuſt man, and is ſecured to the body by two or three ſtrong tapes ſewed far back on each ſide, and tied before; the ſtrings are thus placed to enable any wearer to tighten it to his own convenience.

Cork in its action has the elaſticity of a ſpring, and when preſſed into any aperture, it exerts a force acting outwardly on all ſides from the centre. It is this quality that makes it valuable in ſhutting out the external air from liquors, and elaſtic fluids; and it is fitted for this purpoſe in a degree proportioned to the impermeability of its pores. The elaſticity of cork has alſo been employed for many other purpoſes in the arts; it forms the ſpring of the lifter in ordinary candleſticks, and where the frame is not heavy, it can be made into a good ſubſtitute for the pulleys and weights of the ſaſhes of windows. See Candlestick and Window-ſaſh.

Other vegetable productions have likewiſe been occaſionally employed poſſeſſing qualities ſimilar to cork. The ſpondias lutea, a native of South America, which flouriſhes in moiſt ſituations, and which is there called monbin or monbain, is ſometimes brought to England, as a ſubſtitute for cork. The roots of liquorice are applied to the ſame uſe, and on this account, as well as its medicinal properties, is much cultivated in Sclavonia, and exported to different countries. The tree called myſſa, which is found in North America, has alſo been applied to ſimilar purpoſes.

Cork-*cutting*, or the *Manufacturing of Corks*. This buſineſs, though it is thought one of the moſt dirty, is not one of the leaſt profitable; it is likewiſe eaſy in the acquirement. The cork, after being preſſed into ſquare pieces, as above noted in the treatment of the bark, is received by the cork-cutters, and if not ſufficiently flat for their purpoſe, they "lay" it again over a fire in their "burning yard," turning the convex part to the flame; the heat by twiſting the edges of the bark, counteracts the natural bend, and compels it to receive a flat form. During this operation, a conſiderable degree of attention is paid to ſmoothing it, and particularly again to cover its defects. It is next cut into ſlips, narrow or wide, according to the intended cork, bung, or tap, for ſuch are the names of the general diviſions in this buſineſs. The uſe of the two former is well known, the latter is uſed for ſtopping the tap-holes of barrels, as the name implies. Theſe ſlips are again cut into ſquares, of a length proportioned to the uſe they are intended for. This operation is performed by one man, from whom they are handed forward to ſeveral others. A further diviſion of corks takes place, of theſe different ſorts according to their lengths, and are denominated "ſhort," "ſhort long," and "full long."

The cork-maker places himſelf before the table or plank, on which is faſtened a board about three inches thick, four broad, and twelve long: immediately on a line with his left hand is a piece of wood, riſing about four inches from the board, and fixed about the middle of it, on which the cork is laid, after being cut as above. This wood not only ſupports the cork, and is as a guide to the workman, but by its elevation above the board, gives room for the knife to cut a part of the cork in a ſmooth and circular manner, without ſtriking on the table below. The piece is then turned to where the laſt cut ceaſed, and this is continued until the knife has gone completely round; the top and bottom are then pared level, and the cork thrown into a box or baſket, with the reſt of the ſame length. As the bark is not of the ſame quality throughout each piece, the corks are ſorted by a boy into four kinds, "ſuperfine," "fine," "common," and "coarſe," and are ſold accordingly.

The only tool employed by the cork-cutter is a knife about three inches broad in the blade, and about ſix inches long, very thin and ſharp, and equal in breadth from the handle nearly to the end, which is finiſhed by a gentle curve. This knife he ſharpens upon the board where the guard is placed, by one whet or ſtroke on each ſide, after every cut, and now and then upon a common whet-ſtone.

From the foregoing review it is evident, that the art of a cork-cutter is principally to obtain a regular, round, and quick turn of the wriſt, in guiding the knife ſo as to complete a pretty correct circle, and to make a ſmooth ſurface; it is on this account that the knife muſt be particularly ſharp, to enable the workman to turn it with eaſe.

The parings of the cork are carefully kept, and ſold to the dry colour makers, to be burnt into Spaniſh black.

It may be ſuppoſed that thoſe who give the detail of any manufacture would be the beſt able to point out improvements in it, though this is not always the caſe; yet one improvement in the "laying" of the cork wood, appears of great importance to the writer of this. In the preſent mode, a great deal of time is loſt in placing and removing the ſtones uſed to flatten the bark; and though the weight may be moderated or introduced by degrees, yet it cannot be done in that regular manner which appears the moſt likely to effect the purpoſe. In addition to which it may be obſerved, that in proportion as the weight is careleſsly applied, will be the riſk of breaking thoſe pieces which moſt partake of the circular bend of the tree. To remedy this inconvenience, and to do away the old, groſs, and cumbrous method, a ſcrew might be uſed, ſuch as that employed by the printers in preſſing their work; by its operation a gradual preſſure would be given, the former objections done away, and a much neater and workman-like method adopted.

Cutting the cork into ſtripes might alſo be accompliſhed with much greater facility; the whole breadth of the cork might be cut by one ſtroke, by means of ſemi-circular knives, like ſmall cheeſe knives, ſet at certain diſtances, in a frame, which, by being affixed to a pole, with a croſs-bar as a handle, might be driven through the whole breadth, in the ſame time that a ſingle ſlip is cut by the preſent method.

Cork, *Acid of*, in *Chemiſtry*, a yellowiſh thick acid matter obtained by diſtilling four times its weight of nitrous acid from cork. This is ſoluble in water and has an auſtere bitteriſh taſte. It does not cryſtallize, but becomes conſiſtent like wax by evaporation; is ſoluble in ardent ſpirit; forms deliqueſcent ſalts with the earths and alkalis; and has as ſtrong an attraction for lime as the acid of ſugar.

Cork, *Mountain*, *Suber montanum*, or *Corium montanum*, in *Mineralogy*, a ſpecies of the muriatic genus of earths and ſtones, according to the arrangement of Kirwan (Mineral. vol. i.) Its colour is white, or reddiſh-white, or yellowiſh-grey, or iſabella, or ochre-yellow, or yellowiſh-brown. It is found either in thick compact pieces, and then called "mountain cork;" or in thin flat pieces, then called "mountain leather or paper;" or cellular, and then called "Caro montana, &c." The luſtre is 0, rarely 1, and tranſparency 6. Its fracture preſents fibres confuſedly interwoven with each other, ſometimes ſo ſubtile as to be diſtinguiſhed with difficulty, and thus they give the fracture a compact earthy appearance. Hardneſs 4; it takes an impreſſion, or yields like cork to the finger, and is ſomewhat elaſtic. Sp. gr. before it is penetrated by water, from 0.6806 to 0.9933; and after admiſſion of water, from 1.2492 to 1.3492. (Briſſon.) If perfectly dry, and ſufficiently thick, it gives a ſound when ſtruck. It feels meagre. Bergmann and Sauſſure found it fuſible, though with difficulty, by the blow-pipe. By Mr. Bergmann's analyſis it contains from 56 to 62 *per cent.* of ſilex, 22 to 26 of aërated magneſia, from 2.8 to 12.7 of argill, about 3 of calx of iron, and from 10 to 12.7 of aërated calx.

Cork-*ſcrew*, in *Mechanics*. *Fig.* 1. *Plate* XVII. *Mechanics*, is a ſimple cork-ſcrew, conſiſting of a ſcrew, A, turning in a female ſcrew attached by two ſmall rods to the collar B, which receives the neck of the bottle from which the cork is to be extracted; the two rods have a groove in them to receive the ends of a croſs piece, connected with the cork-ſcrew, and prevent its turning round with the ſcrew A.

Fig. 2. is nearly the ſame, except that the nut, B, is turned inſtead of the ſcrew.

Fig. 3. is called the *ne-plus-ultra* cork-ſcrew; it conſiſts of two cork-ſcrews A, B, one within the other; the ſcrew which enters the cork is fixed to the internal one. In uſing this inſtrument both ſcrews are ſcrewed up to their ſhoulders, and the whole is turned round together till the cork-ſcrew has penetrated the cork. The handle and the two ſcrews are then turned in the ſame direction, without permitting the frame to turn, till the cork is drawn. The handle is then turned the contrary way, and the ſcrew drawn out of the cork by means of the ſmall ſcrew B.

Fig. 4. is a ſcrew of nearly the ſame kind, a rack and pinion being ſubſtituted for the ſcrew B.

A corking-machine is repreſented in *fig.* 5; in which A is a treadle to be worked by the foot; it is connected by a rod *b*, with an iron-lever D; the bottle to be corked is placed in a leathern caſe E, faſtened to a board ſliding in a groove; the cork is inſerted, and the bottle ſlid under the lever D, the foot is then placed on the treadle, and the cork forced in; the corks are firſt pinched by placing them under the lever at *d*, to make them enter eaſily.

Cork-*tree*, in *Botany*. See Quercus *Suber*.

Cork, in *Geography*, a county of Ireland, in the province of Munſter, lying in the ſouth-weſtern extremity of the iſland, and by far the greateſt in extent and population. It has the Atlantic ocean on the ſouth and ſouth-weſt; the county of Kerry on the weſt; thoſe of Limerick and Tipperary on the north, and that of Waterford on the eaſt. Its greateſt length extending eaſtward from Kerry is 78 miles (99 Engliſh); and its greateſt breadth 56 miles ($71\frac{1}{2}$ Engliſh) containing 1,048,800 plantation acres (1,685,920 Eng.) and being about 1638 (or 2,653 Engliſh) ſquare miles. The number of houſes, according to an official return made to parliament in 1791, was 76,739, and they muſt have ſince conſiderably increaſed. From this the population has been eſtimated at 416,000, which is allowing 9.06 to a houſe in the city of Cork, and 5.6 to a houſe in other parts of the county, which thoſe who are acquainted with the many populous towns in this county, and with the manner in which the cottages are crowded, muſt admit to be a very moderate computation. According to this ſtatement, which is taken from Dr. Beaufort, the county of Cork contains very nearly a tenth-part of the number of acres in all Ireland, and above a tenth-part of the whole population. For not only its abſolute population is the greateſt, but its relative population is amongſt the moſt conſiderable, being nearly the ſame as that of Antrim and Londonderry, and exceeded only by the very populous diſtricts of Armagh, Monaghan, Down, Louth, and Dublin. It cannot therefore be wondered at, that it has three militia regiments to keep up. The number of pariſhes is 269, in which there are 105 churches. The biſhoprics of Cork, Roſs, and Cloyne lie entirely within the county, and all the above pariſhes belong to them except five. Cork returns eight members to the imperial parliament, *viz.* two knights of the ſhire, two for the city of Cork, and one each for the boroughs of Kinſale, Youghel, Bandon, and Mellow. In ſo large a diſtrict there muſt be a great variety of ſoil. It contains more good land than bad, and ſome parts of the county are highly cultivated, eſpecially the neighbourhood of the Blackwater, and the barony of Innſkilly in the eaſtern part. The barony of Ban and Bantry, which is covered with mountains, and the weſtern parts of Carbery and Muſkerry, in which are the Sheehy mountains, are the pooreſt and the leaſt improved. The whole county is hilly, and, a few places excepted, very deſtitute of trees, which is the conſequence of the vaſt number conſumed in the iron-works in the 17th century, without new ones being planted. There are however ſome ſpots which are richly wooded. The Galtees and the Waterford mountains bound it on the north-eaſt. The Nagle mountains and the Bogre which run weſtward through the heart of the county, though ſeparated from each other by a long valley, may be conſidered as part of a range, that is continued with few interruptions from Helwick Leed in Waterford, acroſs the counties of Cork and Kerry to the ocean. On the north of this range lies a narrow plain, which extends from the bounds of Tipperary to Dingle-bay. The rocks moſt common in this county are argillaceous. A coarſe red or grey ſandſtone, often varying to a coarſer and more ſlaty fracture, forms the greater part of the coaſt and the hills near it. There are in this many ſtrata of ſlate, ſome of good quality for roofing houſes. A large vein of limeſtone interſects the red argillite, commencing in the peninſula of Corhnbeg and the iſlands in Cork harbour, and extending on the ſouth ſide of the river Lee to its junction with the Bride, and thence through a valley adjoining this latter river to the diſtance of about 12 miles from the city of Cork. This limeſtone is evidently ſecondary as it contains a variety of petrified ſhells; and much of it on ſcraping has that diſagreeable ſmell which characteriſes *Stinkſtone*. This diſtrict contains ſome marbles which admit a good poliſh. In ſome of the limeſtone quarries near the city of Cork, there are not only very tranſparent quartz cryſtals, but alſo large amethyſts which are much eſteemed by the jewellers. The bottom of Bantry bay is entirely compoſed of broken pieces of coral, called coral ſand, which is found to be an excellent manure. In Carbery there is a magneſian limeſtone. On the Cork ſide of the Galtees there is abundance of fine limeſtone, and this uſeful article may be procured on moderate terms in every part of the county. The Galtee mountains themſelves conſiſt of a very coarſe pudding ſtone, in which is much iron ſhot quartz. Near Galtymore, on the eſtate of the counteſs of Kingſton, is the remarkable cave of Skeheenrinky, which is deemed by Mr. A. Young ſuperior to the peak. (See MITCHELSTOWN.) The county of Cork abounds in fine rivers, and good harbours. The Blackwater riſes in the mountains between Limerick and Kerry, and flows eaſtward through this county, receiving the Awbeg, the Funchem, the Bride, and many ſmaller ſtreams in a courſe of 80 miles. The Awbeg is the *Mulla* of Spenſer, who reſided at Kilcolemen-caſtle, not far from its banks, and the Blackwater is the *Awinduff* of the ſame poet. On the banks of the Blackwater are many fine orchards remarkable for the cyder procured from them; and ſeveral handſome ſeats. It is navigable from Cappoquin in the county of Waterford, where it turns to the ſouthward, and diſembogues itſelf in the harbour of Youghel. The Lee iſſues from a lake called Gougane-Barra; which is, according to Smith, a moſt elegant and romantic ſpot, and has by ſome been preferred even to the lake of Killarney. This lake is weſt of Inchigeelch, by which town the river paſſes, and thence to the city of Cork, above which it divides into two branches which unite below the city; and it contributes much to the wealth and proſperity of that great commercial town. The paſſage down the river from Cork to the outer harbour conſiſts of a ſucceſſion of varied and beautiful ſcenery, which can ſcarcely be ſurpaſſed. The Bandon is another fine river, which, after watering the large and thriving town of Bandon-bridge, and the village of Iniſhonan falls into the harbour of Kinſale: it is navigable for large ſloops as far as Iniſhonan, between winding banks which ſtill deſerve the character given them by Spenſer; "the pleaſant Bandon crowned with many a wood." The whole coaſt of Cork is broken into creeks and bays. The harbour of Crookhaven, near Mizen-head, the ſouth-weſt point of Ireland, is often reſorted to, when the eaſterly winds prevent veſſels from gaining the harbour of Cork. Bantry-bay, a little to the north of this cape, is, at leaſt, 20 miles long, and from three to five broad, every where deep, ſheltered, and free from rocks. For particulars of theſe harbours, and of the many towns which this county contains, the reader muſt be referred to their reſpective articles. At Dromagh and Dromana, in the barony of Duhallow are coal-pits, which are worked, but not in a judicious manner, or to much advantage. There is much ironſtone, and there were many furnaces; but the dearneſs of fuel is a great check. Much linen is woven about Dunmanway, which is purchaſed by merchants in Bandon, and ſhipped from Cork. Near Bandon is a very extenſive cotton mill, which gives employment to great numbers. There are ſome other manufactures, but none of much conſequence, except thoſe which belong more properly to the account of the city of Cork. The peaſants in the county are very thickly diſſeminated. In many parts they are very dependent on their landlords, working for them at a low price in payment of the rent of their cottages, and the ſmall lot of ground adjoining them. This has been called the *Cottar* ſyſtem. The cottages in general, though bad, are not ſo wretched in appearance as in ſome other counties, and with ſcarcely a ſingle exception have a ſmall garden for cabbages, as well as a field for potatoes, attached to them. The laſt ſupplies them with the principal article of their food. They all have a pig, and ſome of them ſeveral, in which laſt caſe they generally kill one for themſelves at Chriſtmas. This animal, as well as ſome poultry, often inhabits the ſame dwelling with its owner, though, of late, pig-ſtyes are becoming more common. There is a dunghill formed before the door of every cottage, which has a diſagreeable appearance; but it is often the only place the owners have for laying up manure for their potatoe gardens. Spinning is the general buſineſs of the women, and notwithſtanding the ſevere remarks that have been made on the lazineſs of the lower Iriſh, they are ſeldom ſeen idle. They ſpin more wool than flax. The middling and lower farmers have, of late years, improved much, both in their wealth and manner of living, and there is reaſon to expect further improvement, if the encouragement to agriculture continues, and the peace of the country be undiſturbed. The ſyſtem of agriculture, however, in uſe, is very bad, and much praiſe cannot be beſtowed on the great landholders for their exertions to improve it. Cork partakes, with other counties of Ireland, the evils ariſing from abſentees, ſome of the greateſt proprietors being of this claſs; yet few counties have ſo great a proportion of reſpectable reſidents. With reſpect to the hiſtory of this county, we may obſerve that it was a kingdom of itſelf before the arrival of the Engliſh, and was governed by the M'Cartys. A deſcendant of that family, on reſigning his Iriſh title of *M'Cartymore*, was made by queen Elizabeth, earl of Clancarty, a title which was attainted ſoon after the revolution, in conſequence of the attachment of the earl to the dethroned monarch. Henry II. granted the whole kingdom of Cork by charter to Robert Fitz Stephen and Milo de Cogan, about the year 1177; but they were able to get poſſeſſion only of a ſmall part of it. It is unneceſſary to trace the various changes of property which took place from forfeitures and intermarriages. It may be right however to mention that queen Elizabeth divided a great number of acres, which had been forfeited, amongſt various undertakers, who agreed to introduce Engliſh tenants. Sir Walter Raleigh had three ſeignories and a half given to him on this occaſion, which he ſold, in 1602, to ſir R. Boyle, afterwards the firſt earl of Cork, who was a great improver, and founded ſeveral towns. This property now chiefly belongs to the duke of Devonſhire, who is the repreſentative of the elder branch of the Boyle family. Many of Cromwell's officers afterwards obtained ſettlements in this county. Beaufort's Memoir. Young, &c. &c.

CORK, the ſecond city of Ireland, and capital of the county of the ſame name, was originally built on a low marſhy iſland, formed by the branches of the river Lee, from which circumſtance its name is ſaid to be derived, *corcach*, in Iriſh, ſignifying a moor or marſh. It appears, from the imperfect account we have of the early periods of Iriſh hiſtory, that in the 5th, or, as Ware ſays, in the 7th century, there lived a pious hermit called Barroc, or Fin Barroc, and in after ages, St. Fin Barry, who founded a monaſtery for regular canons of St. Auguſtine, and a ſchool on the ſouth ſide of the river Lee, near the place where the preſent cathedral ſtands; and that his fame drew ſuch numbers to it, that to uſe the words of Colgan, "it changed a deſert into a city." In the 9th and 10th centuries, this monaſtery and town were often plundered by the Danes, who then infeſted Ireland; but, at the beginning of the 11th century, they founded the preſent town in an iſland of the river, of an oval ſhape; and called it either from the name of the town they had burned, or the marſhy ſituation, *Corkan.*

ſan. It was, however, very ſmall, and probably did not contain above 1000 inhabitants; but the creeks which interſected it, were convenient for mooring the Daniſh veſſels, and thus their merchandize and plunder were ſecured. On the arrival of the Engliſh in 1172, Cork became an Engliſh colony, and a royal garriſon. King John ordered the fortifications to be repaired; a ſtone wall was built; caſtles were erected at the north and ſouth gates; and bridges were made with portcullises for maintaining communication with the little towns adjoining the abbeys that had been founded on the north, as well as on the ſouth ſide of the river, and which are now the north and ſouth ſuburbs. Cork, however, was not ſo early a place of the firſt importance in the iſland. Stanihurſt ſpeaks of it as inferior to Limerick and Waterford; and Boate, who wrote near a century later, in the time of Cromwell, as inferior to the ſame towns, and Galway. Camden, who wrote in the time of Queen Elizabeth, thus deſcribes it: "It is of an oval form, incloſed with walls, and encompaſſed with the channel of the river, which alſo croſſes it, and is not acceſſible but by bridges lying along, as it were, in one direct ſtreet, with a bridge over it. It is a populous little trading town, and much reſorted to; but ſo beſet with rebel enemies on all ſides, that they are obliged to keep conſtant watch, as if the town was continually beſieged, and dare not marry out their daughters into the country, but contract one with another among themſelves, whereby all the citizens are related in ſome degree or other." But though the town of Cork was confined to the ſmall iſland now occupied by the main ſtreet and the numerous lanes which interſect it; yet the ſuburbs were conſiderable, and were protected by ſeveral caſtles.

The trade of Cork, in theſe periods, was not extenſive, and the principal ſupport of the inhabitants was the conſumption of the monaſteries, of which there were ſeveral. As a haven, Kinſale was in greater eſtimation. Since the commencement of the 18th century, the town has been gradually enlarged, by taking in and building upon the ſeveral marſhy iſlands which lay near the principal one. The channels which were between theſe, ſerved the purpoſe of canals, and were convenient in ſome reſpects, by enabling the merchants to load and unload their veſſels at their reſpective warehouſes, which often joined their dwelling-houſes. In this, it reſembled a Dutch town, and ſuch is the deſcription given of it in "the Traveller's Guide through Ireland," publiſhed in 1806. It is now, however, more than twenty years ſince the plan was adopted, of filling up theſe canals; and there is at preſent (1807) not a ſingle one in the city, which appears as one iſland, lying between the north and ſouth branches of the river. By this means, there are ſeveral wide pleaſant ſtreets, which want only regularity in the buildings, to enable them to vie with thoſe even of the capital. The health of the city has alſo been promoted, for putrid exhalations aroſe from theſe canals, which were a receptacle for filth of all kinds; and, when the tide was out, had both a diſagreeable ſmell and appearance. Many houſes have been rebuilt, and in conſequence of a new bridge thrown over the north channel, the city is increaſing rapidly on the northern bank of the river. So long ago as 1788, the houſes were 8093 in number; ſince which time, there has been a conſiderable increaſe. The number of inhabitants in ſeveral of the old houſes is very great, in ſome caſes above 50; and from the account Dr. Whitelaw has given of the population of Dublin, we may ſafely reckon ten to a houſe. We ſhall then be within bounds in ſtating the population of Cork at 80,000. It may ſerve to ſtrengthen this opinion, that in the year 1801, when, in conſequence of the ſcarcity, committees were appointed to make returns of the perſons needing chariatable aid in each pariſh, the number was very nearly 30,000. The appearance of the city has nothing ſtriking to recommend it in the ſtructure of the houſes. There are many comfortable, and even elegant manſions, but the want of uniformity, from their being built at different periods, and from the caprice or different views of the builders, prevents their appearing to as much advantage as they would otherwiſe. Cork has no public buildings of much conſequence. The cathedral is a modern church, which is neat and convenient, but is ſurpaſſed by many country pariſh churches in England. The church of the Holy Trinity, or Chriſt-church, is larger, but is only remarkable for an awkward leaning, in conſequence of a ſettlement at the time of building, which ſtrikes every ſtranger, and made it neceſſary to take down the ſteeple. There are five other pariſh churches, and a French church. The Roman Catholic pariſh chapels are three in number, which accommodate immenſe crowds of people. One of theſe has been lately rebuilt at a great expence. There are, beſides, four chapels belonging to friaries and the chapel of the nunnery. There are ſix meeting-houſes for Proteſtant diſſenters, *viz.* one for Preſbyterians, one for Baptiſts, one for Quakers, one for Calviniſts, and two for Methodiſts. The biſhop's palace, which is near the cathedral, is an elegant and convenient modern ſtructure, containing ſome ſpacious apartments. The exchange is a light and elegant building, in the Italian ſtyle, ornamented by columns of the Doric and Ionic orders. It was built by an Italian architect; as was alſo the corn-market houſe, of the Tuſcan order, which has great merit as a building for that purpoſe. Adjoining to the exchange is the city court-houſe, and a very extenſive coffee-houſe. The manſion-houſe, where the mayor reſides, during his year of office, is a plain building, but contains two very ſpacious rooms for public entertainments. In one of them is a ſtatue of William III., of plaſter, which is painted, and which Mr. Twiſs having confounded with a ſtatue of the earl of Chatham, of white marble, has made the ſubject of ridiculing the corporation. The old cuſtom-houſe is a large brick building, which having been deemed ineligible for buſineſs, has been promiſed by government to *the* INSTITUTION *for applying Science to the common purpoſes of Life;* and a new cuſtom-houſe is to be erected in a better ſituation. There are are two theatres; the Theatre Royal is tolerably large, but ſtands in great need of extenſive repairs and embelliſhments; the other, which was built by Mr. Aſtley, is much ſmaller. The aſſembly room is very large, and the profits derived from it increaſe the funds of the North Infirmary, to the corporation of which it belongs. There are ſeveral bridges. St. Patrick's bridge over the north channel is one of the moſt elegant ſtructures in Europe. It is built, in ſome reſpects, on the plan of the beautiful bridge at Neuilly, near Paris, and conſiſts of a centre arch of 60 feet, and two of 50 feet; which arches are exact ſemi-ellipſes. Mr. Shannchau was the architect. Parliament bridge, over the ſouth channel, has been lately rebuilt, with a ſingle arch, and makes a handſome appearance. The new barrack, at a ſhort diſtance from the city, on the north, is on a commanding eminence, ſo as to be ſeen at a great diſtance from the city, in various directions. It is very extenſive, containing accommodation for four regiments of foot, and 1000 horſe, with an hoſpital and ſuitable apartments for officers. The old barrack on the ſouth-ſide is ſtill retained, and there is a convenient general hoſpital near it. The artillery have alſo a barrack and ſtores; and there is a magazine about half a mile from the city. About three miles up the river are very extenſive powder-mills, with large ſtores, at a place called Ballincollig, belonging to government. The public-market, nearly in the centre of the town, is very neat and convenient. The meat-market conſiſts of three rows, on each ſide of which the butchers have ſtalls. The whole is well flagged, covered in, and lighted from above. Adjoining, are the fiſh, poultry, and root markets. Theſe markets are open, and ſupplied on every day, except Sunday; but on Wedneſdays and Saturdays, which are reckoned market days, the ſupply is abundant, and of the beſt quality. There are ſome inferior markets, but they do not deſerve notice. The county jail is a handſome new ſtructure, built at a ſhort diſtance from the city, which will enable the grand jury to take down the ſouth gate at one end of the main ſtreet; on, and adjoining which, was the old county jail. As a new city jail is ſhortly to be erected, the north gate may alſo be taken down, which will be a material improvement to that part of the city. The bridewell is a plain building, ſuitable to its purpoſe. The county court-houſe has been lately new-modelled, and an elegant entrance to it built, ſo as to be more worthy of the extenſive and opulent county, the buſineſs of which is tranſacted there.

There are a great number of charitable inſtitutions, but the buildings are not remarkable. Where the funds, indeed, depend on voluntary contributions, it cannot be expected that there ſhould be money to expend on ornaments. If, however, they cannot be ſpoken of as contributing to the beauty of the city, they undoubtedly do honour to the feelings of the inhabitants. There are two infirmaries, containing upwards of 50 beds; a houſe of induſtry, with commodious cells for lunatics adjoining it; a houſe of recovery, for the reception of fever patients; a lying-in hoſpital; a foundling hoſpital, which receives about 200 children, beſides thoſe at nurſe; a blue-coat hoſpital for 24 boys; a ſchool of induſtry for 100 children of both ſexes, with ſeveral alms-houſes and pariſh ſchool-houſes. There are, beſides, a general diſpenſary, which is provided with every thing neceſſary for reſtoring ſuſpended animation; a ſociety for relieving perſons confined for ſmall debts, and for lending ſmall ſums of money to poor tradeſmen; a ſociety for relieving the labouring poor, in time of ſickneſs; and a ſociety for aſſiſting ſtrangers, and enabling them to return to their reſpective homes. Except the foundling hoſpital, which is ſupported by a tax on coal; and the houſe of induſtry, which receives grants from the county and city grand juries; all of them chiefly depend on voluntary contributions, or on public amuſements, which are made in a great degree conducive to charitable purpoſes. The conſequent difficulty of procuring funds for their ſupport, obliges the conductors of theſe inſtitutions to uſe rigid economy: yet it may be queſtioned, whether the time now ſpent in providing neceſſaries might not be better employed in inſpecting the internal regulations; and whether a permanent ſupport for every uſeful inſtitution would not, on that account, be deſirable. Cork has alſo a ſociety *for bettering the condition and increaſing the comforts of the poor*, which maintains a correſpondence with the ſimilar ſocieties in London and Dublin, and has ſuggeſted many uſeful plans, ſome of which are perſevered in with ſucceſs. Though the citizens of Cork have been ſtigmatiſed, by ſome illiberal travellers, as neglectful of the ſciences and fine arts; yet there ſeems to be no juſt ground for this cenſure. The public library, ſupported by annual ſubſcriptions, contains a large and well choſen collection of books, which is rapidly increaſing. The inſtitution already referred to, which alſo originated in private ſubſcriptions, has a ſcientific library, a large collection of minerals, and the neceſſary apparatus for giving lectures in natural philoſophy and chemiſtry. The managers of it, having received the countenance and ſupport of government, are now adding a botanical garden, and extending their plan in many reſpects. The proprietors of the inſtitution, with ſome other gentlemen, form a literary and philoſophical ſociety, which meets on two evenings in every month. With reſpect to the fine arts, muſic is a favourite amuſement; and there are many excellent performers, both profeſſors and amateurs. The juſtly celebrated Barry, who was a native of Cork, was firſt brought into notice by an ingenious townſman, Dr. Keigh; and there are not wanting, at the preſent time, men who have taſte to diſcern, and liberality to encourage, riſing merit: though a place ſo remote from the capital cannot be expected to afford ſcope for eminent talents. The environs of Cork, towards Paſſage and Glanmire, are extremely beautiful: the lands riſe in gentle hills, ornamented with many country houſes, gardens, and plantations, and with woods and fields of variegated verdure. On an iſland between the two branches of the Lee, above the city, is a walk of an Engliſh mile in length, planted with trees; from which there is a pleaſant view of part of the city, and of the ſuburb of Sunday's Well. It is called the Mardyke, and is a faſhionable walk. But whatever advantages its environs may poſſeſs, or whatever improvements may take place in this city, the ſource of all muſt be ſought in its ſafe and capacious harbour, which has now become a regular ſtation for an admiral, and which is the place of rendezvous for fleets ſailing to the Weſt Indies. The principal export from Cork has long been proviſions, including beef, pork, and butter, made up either for the Weſt Indies, or for the ſupply of the Britiſh fleet. The average exportation of beef, in the years 1743-4-5, was 92,950 barrels; the average of butter, in the ſame years, was 84,105 *cwt.*; and Smith ſays, it was aſcertained that the average number of bullocks and cows ſlaughtered in Cork, from Auguſt to Chriſtmas in each year, was near 100,000. The export of butter began about the year *1633*; and about the ſame time the merchants began to barrel up their beef and butter with hoops bound about with twigs, after the Engliſh manner; and at preſent they are alſo iron-hooped. The average of beef for 19 years, ending in 1773, had increaſed to 291,970 barrels; and that of butter to 120,000 *cwt.* The export of pork was at that time inconſiderable. The average value of the whole exports was 1,100,190*l.* ſterling. The other articles of export were hides, bay and woollen yarn, camblets, ſerges, candles, ſoap, tallow, herrings, glue, wool, and ſome ſmall articles. Of late years, the export of beef, and of all the articles connected with it, has decreaſed; and that of yarn, camblets, and ſerges, has almoſt entirely ceaſed: but the export of pickled pork and bacon, of corn, of porter, ſpirits, &c. has become conſiderable. The quantity of butter exported in 1806 was 160,000 *cwt.*; the number of black cattle, on the average of the three laſt years, was only 18,000; the number of calf-ſkins, on an average of the ſame years, about 50,000. The imports are chiefly for the ſupply of the city, and the adjoining diſtrict. The breweries and diſtilleries of Cork are a great ſource of wealth. There are five porter breweries, beſides many of ale and ſmall beer. That diſtinguiſhed by the name of the Cork porter brewery is the moſt extenſive, not only in Cork, but in Ireland, and is probably ſurpaſſed only in London. There are four large diſtilleries, each of which pays 2100*l.* duty *per* week. At one of theſe is a ſteam-engine, of Boulton and Watt's lateſt conſtruction: it is of 40 horſe power, and no expence has been ſpared in the erection of it. The manufacture of clothing for the army is alſo very extenſively carried on; and there are many leſſer factories for coarſe cloth, ſerge, &c.

The manufactories of ſail-cloth, ſheeting, paper, leather, glue, glaſs, &c. are alſo conſiderable. The corporation conſiſts of a mayor, two ſheriffs, a recorder, and ſeveral aldermen. The charter was given by Charles I. The ſheriffs are choſen by the freemen at large; and, after having ſerved the office, are called burgeſſes. On the day of election, the names of all theſe burgeſſes are put into a box or hat, and five names are drawn out: of theſe five the freemen are to chuſe one to be mayor for the enſuing year. By an agreement, however, which has been entered into by a great number of freemen, who form a club, the ſenior burgeſs, if willing to ſerve, is always elected. The ſame club has alſo aſſumed to itſelf the choice of ſheriffs, ſo as to render the public election a mere farce, or rather a ratification, according to form, of what has been previouſly determined at a meeting of the club. Cork, as well as Dublin, retains the privilege of ſending two members to the imperial parliament. The electors conſiſt of about 1500 freemen, and a number of freeholders in the county of the city, which is very extenſive. The eldeſt ſons of freemen are entitled to their freedom, as well as thoſe who ſerve a regular apprenticeſhip to freemen. Many alſo obtain this privilege by favour every year; for as the number of voters is too great to admit of any attempt to dictate to them at elections, ſo there is little inducement to throw difficulties in the way of obtaining freedom. The income of the corporation, which ariſes chiefly from duties paid by thoſe not free on articles of trade brought into the city, is ſo ſmall as to be ſcarcely ſufficient for the current expences. In hiſtory Cork has not been remarkable. Like moſt other parts of Ireland, it engaged in the intereſt of the impoſtor, Perkins Warbeck, which brought the citizens into ſome difficulty. In 1690 it was beſieged by king William's forces, under the earl (afterwards duke) of Marlborough, and taken after a ſhort reſiſtance. The duke of Grafton, a natural ſon of Charles II., was killed at this ſiege.

Cork is 126 Iriſh miles S.W. from Dublin. The latitude of the obſervatory of the Cork Inſtitution is 51° 53′ 54″ N. Longitude W. from Greenwich, in time, 33′ 56″; in degrees, 8° 29′. Smith, Young, &c. &c.

Cork, *Biſhoprick of*, is ſuppoſed to have been founded in the ſeventh century. It was united with Roſs by queen Elizabeth, in 1586; and they are both contained in the county of Cork, as is alſo the adjoining one of Cloyne. The Union is, in Iriſh miles, about 65 by 17; and in Engliſh, 83 by 23. The number of acres is 480,300, which are divided into 127 pariſhes, of which only 54 have churches. Beaufort.

Cork-*bay*, a bay on the eaſt ſide of Newfoundland iſland.

Cork, or Corking *of a ſaddle*, are pieces of wood upon which the bolſters are made faſt.

This part of the ſaddle was formerly made of cork, whence it ſtill retains the name.

CORLAY, in *Geography*, a ſmall town of France, in the department of the Côtes du Nord; is the chief place of a canton, in the diſtrict of Loudéac. The town contains 1483, and the canton 6481, inhabitants, diſperſed in five communes, upon a territorial extent of 117½ kiliometres.

CORLIEU, in *Ornithology*, the name given by Albinus to the Scolopax *totanus*, the ſpotted red-ſhank of Pennant, and ſpotted ſnipe of Latham.

CORLIN, in *Geography*, a ſmall town of Pruſſian Pomerania, on the river Perſante; 12 miles S.E. of Colberg. It has a few woollen manufactures.

CORLIS, in *Ornithology*, the common curlew, or Scolopax *arquata*.

CORMA, in *Ancient Geography*, a river of Aſia, in the territory of Chalonitis, which diſcharged itſelf into the river Delæs or Silla.

CORMALOS, a river of Aſia Minor, in the Troade.

CORMANTIN, Little, in *Geography*, a village of Africa, ſituated on the Gold Coaſt, three miles from Mawri, and a little below Aga; ſo called in contradiſtinction to Great Cormantin, from which it is diſtant 4 miles W.S.W. The French and Portugueſe formerly carried on a great trade with this place, in which the Dutch alſo ſhared, till it was diſcovered that the negroes adulterated the gold. About the year 1682, the Dutch reſumed the trade, when they enlarged and ſtrengthened Fort Amſterdam, the chief reſidence of the Engliſh, till they were forced to abandon it by De Ruyter, in 1665. The fort is a ſquare ſtone building, fortified with four baſtions, mounting 20 pieces of cannon; having convenient apartments for the officers and ſoldiers, and commanding fine views of the country and ſea. Large ciſterns, receiving the rain-water, ſupply the fort with water.

Cormantin, *Great*, a large and populous town, on the Gold Coaſt, in the territory of Fantin, ſtanding about cannon-ſhot from the fort of Little Cormantin, on a high hill behind, and under the cannon of the fort. The town is occupied by a conſiderable number of merchants and fiſhermen, together with other inhabitants of different employments. Cormantin and Anamaboa were formerly the great marts of the Engliſh and Dutch commerce, as they were much frequented by the Akhauefe, who came hither with their goods in large caravans. N. lat. 5° 5′. E. long. 0° 8′.

CORMASA, or, as Polybius calls it, Curmasa, in *Ancient Geography*, a town of Aſia, in Pamphylia.

COR-MASS, the name of a grand proceſſion, ſaid to have been eſtabliſhed at Dunkirk during the dominion of Charles V., and renewed on St. John's day, the 24th of June. After the celebration of high maſs, the proceſſion, conſiſting of the ſeveral tradeſmen of the town, begins. Each perſon has a burning taper of wax in his hand; and after each company comes a pageant, followed by the patron-ſaint, uſually of ſolid ſilver, richly wrought and adorned. The companies are followed by muſic; and after the muſicians, the friars, in the habits of their order, the ſecular prieſts, and then the abbot magnificently adorned, and preceded by the hoſt. Machines likewiſe of various fantaſtical forms and devices, and as variouſly accoutred, form a part of the ſhew on this occaſion; which is deſcribed as one of the moſt ſuperb and magnificent in the world, by an eye-witneſs, in 1755. Gent. Mag. vol. xxix. p. 263.

CORMEILLES, in *Geography*, a ſmall town of France, in the department of Eure, and diſtrict of Pontaudemer, with 1230 inhabitants. It is the chief place of a canton, which has 15 communes, and 10,063 inhabitants, on a territorial extent of 127 kiliometres.—Alſo, a town of France, in the department of the Oiſe, and diſtrict of Clermont; 4 miles W.N.W. of Breteuil.

CORMERY, a town of France, in the department of the Indre and Loire, and diſtrict of Tours; 7 miles S.E. of Tours.

CORMICY, a town of France, in the department of the Marne, and diſtrict of Reims; 10 miles N.W. of Reims.

CORMION, or Liconium, in *Ancient Geography*, a town of Aſia Minor, ſituated on the Boſphorus of Thrace, and near the weſtern bank of the river Aneretus. This ſmall town lay to the eaſt of the Hermæan promontory.

Cormion *Sinus*, a gulf of Aſia Minor, in the Boſphorus of Thrace, over againſt the Hermæan promontory.

CORMOLAIN, in *Geography*, a town of France, in the department of the Calvados; 10 miles S.S.W. of Baveux.

CORMONS, a town of Germany, in the county of Goritz; 7 miles S.W. of Goritz.

CORMORANT, in *Ornithology*. See PELECANUS *carbo*, and CORVUS *aquaticus*.

CORMOS, or CORMON, in *Ancient Geography*, a town of Arcadia, on the frontiers of Laconia, near the ſource of the river Carrion, S.E. of Megalopolis. In the time of Pauſanias, its ruins only were to be ſeen.

CORN, in *Agriculture*, a term applied to all ſorts of grain fit for food; particularly wheat, rye, &c.

The farmers, indeed, rank under the denomination of corn ſeveral other grains; as barley, oats, and even pulſe; as peas, vetches, &c. which, however, they ſometimes diſtinguiſh by the denomination, *ſmaller corn*.

Europe, in every part of it; Egypt, and ſome other cantons of Africa, particularly the coaſts of Barbary; and ſome parts of America, cultivated by the Europeans; and the Armenians themſelves, produce corn. Other countries have maize and rice, in lieu of it; and ſome parts of America, both in the iſlands and continents, ſimple roots, ſuch as potatoes, and manioc.

Egypt was anciently the moſt fertile of all countries in corn; as appears both from ſacred and profane hiſtory. It furniſhed a good part of the people ſubject to the Roman empire, and was called the dry nurſe of Rome and Italy. England, France, and Poland, ſeem now to have ſupplied the place of Egypt, and with their ſuperfluities ſupport a good part of Europe.

For the firſt diſcovery and culture of corn, authors are much divided: the common opinion is, that in the firſt ages men lived on the ſpontaneous fruits of the earth; as acorns, and the nut, or maſt, produced by the beech; which, they ſay, took its name, *fagus*, from the Greek φαγω, *I eat*. It is added, that they had not either the uſe of corn, nor the art of preparing, or making it eatable. See BAKING.

Ceres has the credit of being the firſt that ſhewed the uſe of corn, on which account ſhe was placed among the gods; others give the honour to Triptolemus; others ſhare it between the two, making Ceres the firſt diſcoverer, and Triptolemus the firſt planter and cultivator of corn.

Diodorus Siculus aſcribes the whole to Iſis; in which Polydore Virgil obſerves, he does not differ from the reſt; Iſis and Ceres being, in reality, the ſame. The Athenians pretend, it was among them the art began; and the Cretans, or Candiots, Sicilians, and Egyptians, lay claim to the ſame. Some think the title of the Sicilians beſt ſupported, that being the country of Ceres; and authors add, ſhe did not teach the ſecret to the Athenians, till ſhe had firſt inſtructed her own countrymen. Others ſay, Ceres paſſed firſt into Attica, thence into Crete, and, laſt of all, into Sicily: many of the learned, however, maintain, it was in Egypt the art of cultivating corn firſt began; and it is certain, there was corn in Egypt and the Eaſt, long before the time of Ceres. For the various modes of producing corn, and preparing it for uſe; ſee HUSBANDRY, and other articles appropriate to each kind of grain in this dictionary. For the beſt method of preſerving corn, ſee GRANARY.

CORN *Laws*, in *Rural* and *Commercial Economy*, are thoſe laws and regulations which relate to the importation and exportation, as well as general trade in grain. They are a ſet of rules and regulations which have undergone much change and alteration at different periods, but which ſtill ſeem far from having attained that degree of perfection which is eſſential in ſo important an article of commerce. It has been remarked by an able writer, that "almoſt every other manufacture may be admitted to a free trade; but as the trade of corn muſt at all times be limited by, and ſubſervient to, the neceſſities of the ſtate, it requires the attention of a careful and foſtering parent." It is therefore contended, that the agriculture of the nation "ought to be guarded by the wiſeſt laws and the ſtricteſt execution of them, as the only certain means of employing the greateſt number of people, and conſequently of encreaſing the population; and that it is the better entitled to this attention, that the farmer and the landholder pay a full proportion of all taxes impoſed for promoting and protecting the ſale of our other manufactures, both at home and abroad, as well as for the growth of corn at home."

Though very different principles have been laid down as the baſis of theſe laws at different times, it ſeems evident that, as the ſtrength and power of a nation muſt be proportioned to the extent and induſtry of its population, the chief attention of the framers of them ſhould be directed to ſuch meaſures as have an immediate tendency to encourage and promote the improvement of agriculture. It has indeed been contended, on the ground of long experience, that the foundation of ſuch regulations ſhould always be ſuch as is calculated to induce the inhabitants to improve their grounds in ſuch a manner as to raiſe the largeſt proportion of grain, the particular ſoil and climate is capable of permitting. And that this is "an object which can only be attained by ſecuring a certain and ſteady market to the farmer for his produce; not only by preventing importation, but alſo, whenever it ſhall appear, from the moderate price of grain at home, that a greater quantity has been raiſed than is required for the annual ſupply of the inhabitants, by giving ſuch a bounty on exportation, as ſhall enſure a ready vent for the excreſcent ſtock in foreign countries. It is not enough, ſays the able writer, that a nation raiſes, in general, a ſufficiency of corn for the conſumption of its inhabitants: it muſt be accuſtomed to raiſe conſiderably more, in order to afford plenty in bad ſeaſons; and its annals ought to be diſtinguiſhed by a greater or leſſer *exportation*; but on no occaſion ought it be reduced to the neceſſity of *importation*, and having recourſe to foreign countries for an expenſive and precarious relief."

Mr. Young in his "Political Arithmetic" likewiſe remarks, in ſpeaking of the obſtacles which bad corn laws throw in the way of good huſbandry, and of the want of permiſſion to export grain in Spain, Portugal, and ſome parts of Italy, that he does not conceive it poſſible, "under ſuch a ſyſtem, to have a flouriſhing corn huſbandry—prices will be too fluctuating—ſome years will be ſo cheap that the farmers will be ruined, and others ſo dear that the people will be ſtarved. Long experience muſt convince us, continues he, that this is not only reaſoning but fact. Famines never appear in countries that admit a free exportation; but in all above named, where a contrary policy has been purſued, they have appeared frequently and ſeverely." And he farther obſerves that "the variations in the earth's products, owing to ſeaſons, though not ſo great as ſome have imagined, where the huſbandry is good, yet where it is indifferent, muſt neceſſarily be conſiderable." He thinks that one maxim may be laid down on this ſubject which can hardly be contradicted, which is, that "the good of huſbandry requires that the price of corn ſhould be proportioned to the product. Let us then, adds he, ſuppoſe the common conſumption of a nation to be 5,000,000 of quarters of bread corn: the proportion between the common product and the common conſumption muſt vibrate according to various circumſtances.—Suppoſe a crop of 6,000,000 of quarters, and no exportation, what, he aſks, muſt be the conſequence? There is the ſurplus of a ſixth in the markets, conſequently the price is brought down much lower than that proportion. Here, ſays he, lies the misfortune. If corn in ſuch a year yielded a price proportioned only to the plenty, the misfortune would not be great; but the addition in the markets of a ſixth ſinks the price probably a third, and perhaps more." And further, ſuppoſing "another good crop, with a new ſurplus of a ſixth or ſeventh; this coming upon granaries full of a part of the former ſurplus, ſinks the price yet lower; and then the farmers are not only diſcouraged, as, he ſays, ſeveral writers have obſerved, from ſowing another crop, but what is as bad, they are impoveriſhed ſo much that they cannot plough, harrow, dung, drain, ditch, fence, or do any thing with proper ſpirit. Theſe two circumſtances, inability in future to act well, and diſcouragement from ſowing again, can hardly fail, he thinks, of occaſioning in future years a ſcarcity, or probably a famine. Then the farmers reap of courſe a thin crop, from their former inability, and that too over only part of the land uſually ſown; in ſuch a caſe, corn, he contends, muſt be very high to recompenſe the farmer; probably ſo high, that the government of the country is alarmed, and imports corn from wherever they can get it; then the price falls, when he again ſuffers. Thus a great crop or a bad one operates equally againſt him, and nothing can ſupport him at all but ſuch a product as pretty exactly anſwers the annual conſumption. There is no balance preſerved in the meaſures, exportation is prohibited, yet importation is allowed; ſo that it is impoſſible the price ſhould with any regularity be ſuch as can encourage good huſbandry."

"On the contrary, if the policy of the ſtate admits exportation, the ſurplus of a large crop being ſent away, keeps the price at home, he maintains, from falling too low: this is an encouragement to the farmer acting two ways; firſt, by enriching him, he is able the better to improve all his culture; ſecondly, he is induced to ſow as much corn as poſſible, for every man, whatever be his trade, is deſirous of increaſing that commodity which ſells beſt at market."

The bounty on exportation, which was formerly given in this country, is conſidered as a refinement on this policy, and which, though given originally with the view of raiſing the price of grain, as an encouragement to the country gentlemen, yet it had the contrary effect, having rendered corn much more cheap, by becoming ſo great an inducement to the cultivation of it.

It is, in ſhort, ſtrongly contended, that "in ſuch countries as will adhere to ſo deſtructive a ſyſtem as that of reſtraining the export of corn, it is not of much conſequence whatever advantages are given to huſbandry, ſince all others united, that can be named, or thought of, will not make amends to the farmer for the want of a market: it is of no conſequence to enable him to raiſe noble crops, if when he has got them, he cannot ſell at a proper price; his plentiful harveſts tend only to his ruin."

From the fulleſt conſideration of the ſubject in various points of view, an able writer conceives it obvious, "that agriculture and manufactures are eſtabliſhed on very different principles, and that whilſt wealth and population raiſe conſiderably the money price of corn, and other rude produce of the ſoil, they have not an equal effect in advancing the price of manufactures." Hence, contrary to the opinion of the celebrated author of the Wealth of Nations, it is ſuppoſed the following political maxim may be fairly deduced: "that agriculture in rich and populous countries, ſtands more in need of a monopoly for its ſupport than manufactures; and that the farther a nation advances in proſperity, it becomes the more neceſſary to ſecure its agriculture, not only by reſtraining the importation of foreign corn, but alſo by removing every impediment which may prevent, and by giving every encouragement which may promote, the extenſion of cultivation and improvement over the whole face of the country."

Conſequently, that, if this country wiſh "to preſerve her preſent ſuperiority in wealth and reſources over the ſurrounding nations, agriculture muſt be protected by allowing to the huſbandmen prices for their produce proportioned to the internal wealth and proſperity of the country; and that, if at any time, the bringing in of foreign corn tends to ſink the money price of Britiſh grain below the correſponding value of labour and other commodities, the importation muſt be checked by judicious laws, altered from time to time, at different periods, to correſpond with the proſperous or declining ſtate of the country."

The principles on which the corn laws have been conſtructed at different times, ſo far as they can be traced and recognized, appear to have been theſe.

1ſt. That of cutting off the importation of corn from foreign countries, except when the price at home was very high.

2d. That of granting a bounty on the exportation of it, when it does not exceed certain prices.

3d. That of having recourſe to both theſe meaſures according to circumſtances; or what may be termed a ſort of mixed or ſhifting policy, without any thing being permanent, without any regular law, or due arrangements of prices at which export ſhould be allowed, or import be prohibited.

4th. That of lowering the import rates and duties, as well as that of the bounty, on exportation in a conſiderable degree, in order to reduce the prices of corn in the home market, to the ſtate of former periods, and thus to introduce a permanent law in reſpect to corn by which the inconveniences of a varying policy may be remedied. And,

Laſtly, That of regulating the import and export of corn, and the bounties and duties upon them, by the particular circumſtances of the period, ſo that the farmer may obtain a fair and reaſonable profit in the home market.

Having now conſidered the different objects which ſhould be particularly attended to in conſtructing laws for the regulation of the commerce in grain, and ſhewn the principles on which they ſeem to have been in general founded, it may not be improper to trace the cauſes from which they proceeded, and the effects which they have produced at different times.

In regard to the corn laws of this country, as they exiſted previous to the revolution in 1688, it may be obſerved, that in order to preſerve the laws of the kingdom in force, it was conſidered neceſſary, for ſeveral centuries after the conqueſt, to renew or confirm them upon the acceſſions of new ſovereigns, a practice which explains the reaſon of the various confirmations of the great charter, and the frequent re-enactions of the ſame laws, on this ſubject, as well as others, without any new meaning appearing on the ſtatute-book.

At this period, the rents of lands, held by farmers or tenants, were for the moſt part payable in produce, as in corn, cattle, or ſome other product afforded by the ſoil. And the rules by which the rents were received were extremely indefinite and irregular; the meaſures of grain being various, and taken heaped, nine buſhels generally conſtituting the quarter. For though by the great charters of king John and Henry III., which had been often confirmed by ſucceeding kings and their parliaments, one weight and meaſure had been directed to be made uſe of over all England, yet it was far from being the caſe, as is ſhewn by an act of 1360, the 25th of Edward III., in which the weights and meaſures are again attempted to be regulated; and in which it is directed, that eight buſhels ſtricken and no more, ſhall be received as the quarter of grain, "but ſaving the rents and farms, and all manner of franchiſes of the lords." On which Mr. Dirom remarks, that, "with ſuch reſervations, it is not to be expected that the law could have any effect." And he adds, that, "under ſuch impoſitions with the oppreſſion of purveyance, and the depreſſed ſituation in life wherein the farmers were placed, it is not to be wondered that agriculture languiſhed, and that a numerous community depended upon foreign proviſions for their ſubſiſtence."

In tracing the progreſſive advances of agriculture from this depreſſed ſituation, it may be neceſſary to obſerve, that, at theſe periods, moſt of the buſineſs of the dealer or trader was carried on in the different markets and fairs of the kingdom, and that a large proportion of the revenue of the crown was drawn from the duties payable to the king, on the goods brought to them in order to be ſold. And the barons had likewiſe, within their reſpective juriſdictions, tolls at the fairs. Hence it not unfrequently happened, that as the farmers and other dealers were conveying their corn and other neceſſaries to the markets and fairs to be diſpoſed of, they were met by perſons on the road, in order to purchaſe them for the purpoſe of retailing them at a higher price, in conſequence of which, the king and the lords of the manors were deprived of the different duties payable upon them, and at the ſame time the price was inhanced on the people, in conſequence of the diminiſhed quantity brought to market. It of courſe became neceſſary, both on the ſcore of public and private intereſt, to prevent the practice as much as poſſible, by the infliction of ſevere penalties; and various laws were enacted for the purpoſe at different times, the offenders being termed foreſtallers, regrators, and ingroſſers.

Hitherto, as various laws had been formed with the view of inviting the importation of foreign articles of neceſſity, while the exportation of the ſuperabundant ſtock of Britiſh grain had been prohibited, it cannot be ſuppoſed that agriculture had been encouraged as an object of national importance. About this period, 1393, however, a law was made, the 17th Richard II. c. 7, which authorized all the king's ſubjects to carry corn out of the kingdom, upon the payment of the cuſtoms and ſubſidies. And which was confirmed in 1425, reſerving to the king and council, power to reſtrain the exportation when they ſhould judge it neceſſary.

However, from this reſervation being conſtrued into a prohibition to export grain without a licence, or from the difficulty of procuring the licence, the beneficial conſequences to be derived from it were prevented; and from the check which was thus given to the art of cultivation, much inconvenience and diſtreſs experienced in the country, as is fully ſhewn by the preamble to the law of 1436, the 15th Henry VI. c. 2, by which it was followed, and in which liberty was given to perſons to tranſport grain, without a licence to wherever they choſe, except to the enemies of the king, when wheat was at 6*s.* and 8*d.* and barley at 3*s.* the quarter; which were ſums rather above the medium prices, being in the proportion of the preſent money of 2*l.* 4*s.* for the quarter of the former, and 19*s.* 10*d.* for that of the latter.

The advantage of this law had been found ſo beneficial to the country in reſtoring abundance of grain, that it was in 1442 and 1444, confirmed and continued for ten year as well as ſoon afterwards made perpetual, by the acts of 20 Henry VI. c. 6. and 23 Henry VI. c. 5: and the effects of which, ſo far as they can now be diſcerned, were thoſe of a very moderate and more ſteady, or leſs fluctuating, price of corn for forty years.

However, notwithſtanding this, the laws favouring the importation of foreign grain ſtill continued in force; and the trade was in the hands of foreign merchants or dealers, who conveyed their corn or other articles from one port to another, ſo as to anticipate the Engliſh farmers in the ſale and diſpoſal of their grain or other produce. And it is ſuggeſted by Mr. Dirom in his "Inquiry into the Corn Laws and Corn Trade," that, "although thoſe merchants may have loſt upon the grain which they imported into England at this time, they gained upon the general courſe of the trade; becauſe they received in return, wool, unfiniſhed woollen cloth, and ready money, upon which they made great profit in their own countries, and thus were enabled to underſell the produce of our fields at home."

Further, "this appears to have been the caſe, even after this period, from two reſtrictive and regulating laws of Richard III. 1, c. 8, 13, by the laſt of which it appears, that the foreign merchants who imported wines into England, had not only taken their payment two-thirds in woollen cloth, and one-third in ready money, but had conſiderably leſſened the contents of their wine caſks, although ſold under the former titles and contents."

The inconvenience and conſequent diſtreſs to which the buſineſs of cultivation was expoſed, by the conſtant importation of foreign grain, at length awakened the attention of the legiſlature, and in 1463, a preventive law was made, 3 Edward IV. c. 2; ſome of the cauſes of which ſeem to have been, that the labourers or cultivators and occupiers of land, had been grievouſly injured by the importation of foreign grain, when corn at home was at a low price; by which the importation of foreign grain was prohibited, until the prices at home ſhould exceed 6*s.* 8*d.* the quarter for wheat, 4*s.* for rye, and 3*s.* for barley; which is in the proportion of 1*l.* 15*s.* 2*d.* 1*l.* 1*s.* and 15*s.* 10*d.* of the preſent money.

The able author quoted above, conſiders theſe as the laws to which the agriculture of this country owes its origin; and that notwithſtanding their objects have frequently been defeated by others, they are the baſis or foundation which ſtill remains; and on which a great fabric, now out of repair, has been erected; but which, by "moderate attention, may long continue to be the chief ornament and ſupport" of the kingdom. It was on theſe laws, he adds, that the agriculture of the country reſted for nearly a century; though the want of their being duly executed, rendered them in a conſiderable degree nugatory. For as the prohibition of the importation of foreign grain, was never ſufficiently regarded; the occupiers of land had ſtill to contend with the competition of grain from abroad as well as other oppreſſions and grievances at home; as is fully ſhewn by an act made in the year 1552 againſt regrators, foreſtallers, and ingroſſers, the 5 and 6 of Edw. VI. c. 14; "by which the crime of foreſtalling is extended to perſons buying victuals coming in ſhips from beyond the ſeas, to be ſold in any market or fair, city, port, haven, creek, or road, as if no laws had ſubſiſted by which ſuch importation had been prohibited." And after obſerving that although the "repreſſion of the practices of foreſtalling and regrating might have been neceſſary," it is not eaſy to diſcover any cauſe "for the enactment of ingroſſing" at a period ſo late as this when commerce had made ſuch conſiderable advances: and further that, "by the ſame law, no perſon at home could tranſport corn from one port to another without a licence; neither could they purchaſe corn to be laid up in their granaries for home ſale, until the quarter of wheat was at, or under, 6*s.* 8.*d.* (equal to 16*s.* 6*d.* of preſent money): malt and barley at 3*s.* 4*d.* (8*s.* 3*d.*); oats at 2*s.* (4*s.* 11½*d.*); peaſe and beans at 4*s.* (9*s.* 11*d.*): and rye at 5*s.* (12*s.* 5*d.*) per quarter."

By theſe means it is contended that the former ſyſtem of corn laws was wholly ſubverted, for that, "although theſe were the prices to which exportation was limited by the act of Edward IV. in 1463, the value of money was materially changed; for, at the former period, there were only 37*s.* 6*d.* in the pound of ſilver, and now there were 60*s.* and at the former period, money bore a very high and unlimited intereſt, and now, it yielded only about 12 *per cent. per annum*; ſo that 6*s.* 8*d.* for a quarter of wheat, in 1463, was equal to 1*l.* 15*s.* 2*d.* and in the year 1552, it was only equal to 16*s.* 6*d.*" as has been noticed above. And further that the prohibition to the purchaſing of grain for ſtoring up or conveying coaſt-ways, till the price ſhould ſink beneath the expence of raiſing it, muſt have neceſſarily put a total ſtop to all dealings in grain and of courſe ruin the farmers; all of which was done at a period when the price of corn had been invariably at a low ſtate. It is ſuppoſed not to have occurred to the legiſlature at this period, that by keeping the grain at home in ſeaſons of great plenty the price muſt be inhanced, as the farmers would not be capable of continuing their trade of raiſing grain under ſuch diſadvantageous circumſtances; of courſe, that as ſoon as the ſtock on hand was conſumed, ſcarcity if not famine muſt be the conſequence; nor that by permitting an exportation of the excreſcent ſtock, plenty would be enſured, by preſerving an open market to the farmers, and in that way enabling them to carry on their buſineſs, and raiſe more grain than was in general neceſſary for the home conſumption: nor was the benefit that would ariſe to the nation, from the increaſed number of perſons who might be engaged in raiſing and exporting the quantity of corn that could be ſpared, or the ſums of money which would be brought into the country as the price of it, in the leaſt attended to.

It ſeemed to have proceeded on the idea that the only mode of preſerving plenty, was that of keeping the whole of the corn and other proviſions at home, and importing as much as poſſible from abroad, which appears from experience to be far from having any foundation in truth.

However, the ſame ſyſtem was farther enforced and followed out by the enacting of another law this year 1554, 1 & 2 Phil. & Mary, c. 5. under the ſuppoſition of injury from the exportation of corn and other victuals; by which it was provided that "no manner of perſon or perſons ſhould export any wheat, rye, barley, or other ſort of grain, growing within England; or any malt made within the ſame; or any butter, cheeſe, herring, or wood, without having licence ſo to do, under ſevere penalties; except when the common price of corn, within England, ſhould not exceed for wheat 6*s.* 8*d.* (equal to 16*s.* 6*d.* of preſent money): rye 4*s* (9*s.* 11*d.*) and barley 3*s.* (7*s.* 5*d.*) per quarter.

Such was the policy of Edward IV. as well as of Philip and Mary, notwithſtanding the price of wheat this and ſeveral years before, had been only 8*s.* the quarter (equal to 19*s.* 10*d.* of preſent money); and the export prices below the medium ones in times of ordinary plenty; and in Scotland it was ſoon afterwards followed by laws expreſsly prohibitory under very ſevere penalties of the exportation of all ſorts of victuals, tallow, and fleſh. Mary par. 6. c. 40. Jas. par. 11. c. 55.

After the enacting of this law, from the ſeaſons being favourable and the importation of foreign grain being continued, though the price of wheat remained about 8*s.* the quarter; the farmers became ruined, and the buſineſs of cultivation much relinquiſhed; which ſtrongly marks the abſurdity of directing perſons to labour in occupations in which they cannot procure a reaſonable ſubſiſtence. The excellent laws of Henry VI. and Edw. IV. had continued without repeal throughout the reigns of Henry VII. and VIII. without, however, being countenanced or having any execution, yet theſe ſovereigns, as well as Edw. VI. and Philip and Mary, made repeated laws to enforce the people to cultivate and ſow their grounds, 4 Hen. VII. c. 19. 7 Hen. VIII. c. 1. 27 Hen. VIII. c. 22; 5 and 6 Edw. VI. c. 15. 2 and 3 Phil. and Mary c. 2. thoſe of the latter being particularly prejudicial in repreſſing the ſpirit of huſbandry.

Theſe inconſiſtencies did not however eſcape the attention of Elizabeth, as almoſt immediately upon her acceſſion ſhe not only renewed the laws which formerly exiſted for rebuilding farm houſes, and tilling the land formerly in cultivation with greater vigour, 5 Eliz. c. 2. but by another law 5 Eliz. c. 5. § 26. permitted farmers to export their corn as merchandize, when the price was not high at home, as when wheat did not exceed 10*s.* the quarter, equal to 1*l.* 8*s.* of preſent money, rye, peas or beans, 8*s.* (16*s.* 7*d.*) barley and malt 6*s.* 8*d.* (13*s.* 10*d.*) And as in the former of theſe laws, the penalties had been given to the king, they were now given to the next heir, &c. of the perſon offending. By this means a conſiderable extenſion of the exportation prices took place, which is remarked by the beſt writers of that period to have had a direct and immediate effect in the increaſe of tillage and the reduction of importation, though it had been obſerved by one of them that for ſeveral years preceding that time, "the importation of grain had exceeded forty-five millions of livres." Theſe are probably the firſt traces of the navigation laws.

Not long after this, in 1570, a ſtill more vigorous effort was made to reſtore the agriculture of the country, in a law enacted for the better increaſe of tillage, &c. 13 Eliz. c. 13. by which exportation was permitted, without limitation of prices, from ſuch ports and creeks, in which a cuſtomer or collector of the ſubſidy of tonnage and poundage, had been placed, to any part beyond the ſeas in amity with England, when not reſtrained by proclamation, provided ſuch exportations were made in ſhips belonging to Engliſh born ſubjects reſiding within the dominions; at ſuch times as the ſeveral prices of grain ſhould be ſo reaſonable and moderate, when ſuch exportations were intended, as that no prohibition ſhould be made by the queen's proclamation, or by the preſidents of the North, or of Wales, within their ſeveral juriſdictions; or of the juſtices of aſſize at their ſeſſions, in other ſhires out of the juriſdiction of the ſaid two preſidents and councils; or by the major part of the juſtices of peace of the county at their quarter ſeſſions. Thus, theſe different magiſtrates were to annually confer and deliberate with the inhabitants of the county concerning the prices of the different ſorts of corn within their juriſdictions, in regard to its cheapneſs or dearneſs, and by their diſcretion decide whether it would be meet, at any time, to prevent any grain from being carried out of the realm, by any port within their juriſdictions or limits, and by a writing under their hands and ſeals, make a determination, either for permiſſion or prohibition, and cauſe the ſame to be publiſhed by the ſheriffs of the ſeveral counties; which was to continue in force until the ſame ſhould be altered, by the ſaid preſidents and councils, or other powers reſpectively, except the ſame ſhould, in the mean time, be countermanded by the queen, her heirs or ſucceſſors; or by ſome order of the juſtices of peace, in the counties ſituated out of the juriſdiction of the ſaid two councils, in their quarter ſeſſions to be holden in the mean time, or the greateſt part of them, ſhould find the determination of the juſtices of aſſize to be hurtful to the country, in conſequence of the dearth, or a great hindrance to tillage, in conſequence of the great cheapneſs; which determination was in like manner to be publiſhed, and continue in force until a new regulation ſhould be made; except the ſame ſhould in the mean time be altered by the queen, her heirs or ſucceſſors: provided always, that theſe preſidents &c. ſhould not publiſh their determinations, until the ſame was firſt notified to, and approved by, the queen, or her privy council; and that the cuſtom or poundage be paid upon exportation: provided likewiſe, that the queen, her heirs and ſucceſſors, might at all times by proclamation, prohibit exportation, either generally from all the ports of the realm, or particular ports only.

Mr. Dirom ſuppoſes the corn trade, in this caſe, to have been conſidered in a ſcientific manner; and that if the plan marked out had been properly digeſted and modified, as well as the duties upon exportation removed, there could have been no doubt of the act producing the moſt beneficial conſequences to the kingdom; but the judges, to whom this important buſineſs was intruſted, had no certain rule by which to direct their proceedings, not being permitted to determine, by the price of grain at the time of their annual inquiry, the only certain index of plenty or deficiency, but ſimply upon a conference with the people of the country, to decide whether it would be hurtful to the kingdom, from the dearth, or a great hindrance to tillage, from the too great cheapneſs, to admit the exportation of corn, than which, he thinks, nothing could be more vague and uncertain. But further that, "whatever conſideration might have been given to the framing of this act, the laying a duty of twenty *per cent. ad valorem* upon grain to be exported by licence, and ten *per cent.* upon grain to be exported by the ſtatute, was equal to prohibition, and gave full ſcope to the importation of foreign grain, which was ſtill (he ſays) received without the payment of any duty."

However, "in Scotland, the prohibition to export grain to foreign parts was continued under ſevere penalties;" as by Jas. 6. par. 11. c. 55.

Judging concerning the effects of the preceding law of England, from the prices of grain immediately ſubſequent to it; they do not ſeem to have been favourable, as the price of the quarter of wheat in 1574 was 2*l.* 16*s.* equal to 5*l.* 15*s.* 8*d.* of preſent money; and in 1587 not lower than 3*l.* 4*s.* equal to 6*l.* 12*s.* 8 *d.*

In 1593, the corn laws ſeem to have again undergone a ſort of reviſion, though the reaſon is not by any means explained; but they are taken notice of in an act, the 35 Eliz. c. 7. made for the adjuſting of other acts, and which is entitled, "An Act for reviſing, continuance, explanation, and perfecting of divers Statutes:" by which it would ſeem, that the abſurd and impracticable ſcheme of forcing the people to labour or cultivate their land, whether they could live by ſuch means or not, had been given up; as the act paſſed in the 5th of the preſent reign was now repealed, and the plan laid down by that of the 13th appears likewiſe, from other circumſtances, to have been relinquiſhed, though the act itſelf is neither mentioned nor repealed, as the reſolutions of the legiſlature are found to be changed by the 23d ſection of the preſent act: by which exportation was permitted, when wheat was at 20*s.* the quarter (equal to 2*l.* 1*s.* 4*d.* of preſent money); rye, peaſe, and beans, at 13*s.* 4*d.* (1*l.* 7*s.* 8*d.*); and barley and malt at 12*s.* (1*l.* 4*s.* 10*d.*); which are exactly double the prices at which exportation was permitted by the former law of the 5th. However, at the ſame time, the duties payable upon corn, exported by force of the ſtatute, were doubled; which, together with an unlimited importation, without the payment of any duty whatever, amounted to a prohibition, and conſequently rendered the act nugatory, keeping the price of grain at an extravagant height; as, in 1594, the quarter of wheat ſold at 2*l.* 16*s.*, equal to 5*l.* 15*s.* 8*d.*; in 1595, at 2*l.* 13*s.* 4*d.*, equal to 5*l.* 10*s.* 2*d.*; in 1596, at 4*l.*, equal to 8*l.* 5*s.* 4*d.*; and in 1597, at 4*l.* 12*s.*, equal to 9*l.* 10*s.* of preſent money.

The laws concerning grain continued, however, in this ſituation till 1604, when, on the acceſſion of James I. to the crown, various ſtatutes were reviſed; ſome continued, and others repealed, without any ſpecific reaſon being given; and one was enacted in reſpect to grain, the 2 Ja. I. c. 25. § 26, 27. by which the exportation prices were conſiderably increaſed; namely, when the quarter of wheat was at 26*s.* 8*d.* (equal to 2*l.* 13*s.* 4*d.* of preſent money); the quarter of rye, peaſe, and beans, 15*s.* (1*l.* 10*s.*); the quarter of barley and malt, 14*s* (1*l.* 8*s.*); provided the grain was carried abroad in ſhips belonging to Engliſh born ſubjects; reſerving to the king, his heirs, and ſucceſſors, the power to reſtrain, by proclamation, the exportation from the realm in general, or from particular places. But from exportation being ſtill, under this act, encumbered with duties, it is obviouſly that the complete operation of it muſt have been greatly retarded or prevented.

And in another reviſing act of the ſame reign, 21 Ja. I. c. 28. § 3, 4. in the ſections relating to grain, the exportation prices were ſtill farther extended, under ſimilar terms with the former act; namely, the quarter of wheat at 32*s.*, the quarter of rye at 20*s.*, the quarter of peaſe and beans at 16*s.*, and the quarter of barley and malt at 16*s.*, of current Engliſh money. This extent of 32*s.* for wheat was equal to 3*l.* 4*s.* of preſent money; 20*s.* for rye, to 2*l.*; and 16*s.* for barley and malt, peaſe and beans, to 1*l.* 12*s.*: which different ſums are nearly double the medium prices of the preſent time, conſequently very great, having obviouſly the extenſion of revenue in view. Beſides this, the penalties for ingroſſing were obviated by this act, while the prices of grain did not exceed thoſe ſtated in it, which was become eſſentially neceſſary, in order to reſtore the internal as well as external trade in corn, which they had nearly put a ſtop to.

But the duties upon exportation having ſtill been kept up, the proper effects of the law could not be produced.

In 1627, not long after the acceſſion of Charles I., it was again renewed in exactly the ſame terms, 3 Cha. I. c. 5. § 24, 25. It is, however, remarked by Mr. Dirom, that "although the export prices were literally the ſame, they were very different in fact; for, in the year 1624, the yearly intereſt of money having been reduced from 10 to 8 *per cent.*, 32*s.* for a quarter of wheat, which, in 1623, was equal to 3*l.* 4*s.*, was, in 1627, equal to only 2*l.* 11*s.* 2*d.* of preſent money;" and ſo in proportion, in reſpect to the prices of other grain. It is conceived that the long interval of parliament, after the ſeſſion in which this act paſſed, and the confuſion which quickly ſucceeded the meeting of the following parliament, in 1640, were probably the cauſes of no farther attention having been had to the buſineſs during the remainder of the reign.

Though, from the unfortunate circumſtance of connecting the corn laws with the revenue, the excellent inſtitutions of the reign of Elizabeth, and thoſe of her two immediate ſucceſſors, had in a great degree been fruſtrated, agriculture had, in other reſpects, been treated by the laws as an object of much importance; not merely in the view of the numbers employed in it, or the intrinſic value of the produce which it afforded, but likewiſe in conſequence of the ſupport which would be given to the navy, from the export trade, ariſing from it. On the reſtoration of Charles II., however, it was inconſiderately abandoned, being treated merely as an object of revenue.

In the year 1660, without the leaſt reaſon being ſtated for any alteration in the corn laws, in a ſection of the act of tonnage and poundage, 12 Cha. II. c. 4. § 11, corn is conſidered in the ſame liſt or roll with other articles, on which duties are made payable. The exportation prices of grain were ſtill more extended; but the duties were raiſed ſo high, as to be equal to a prohibition. Importation was alſo permitted; but the duties here likewiſe operated as a prohibition. The prices ſet for the exportation of wheat being 40*s.*, equal to 2*l.* 8*s.* of preſent money; 24*s.* for the quarter of rye, peaſe, and beans, equal to 1*l.* 8*s.* 10*d.*; 20*s.* for the quarter of barley and malt, equal to 1*l.* 4*s.*; and 16*s.* for the quarter of oats, equal to 19*s.* 2*d.* And further by this act, the duties payable on exportation were 20*s.* for the quarter of wheat, equal to 1*l.* 4*s.*; 10*s.* for the quarter of rye, peaſe, beans, barley, malt, and buck wheat, equal to 12*s.*; and 6*s.* 8*d.* for the quarter of oats, equal to 8*s.* And by the ſame act, the rates inward, or duties on importation, were thus regulated: for the quarter of wheat, when the price, at the place of importation, did not exceed 44*s.*, equal to 2*l.* 12*s.* 10*d.*, the ſum of 2*l.*, equal to 2*l.* 8*s.*; and when it exceeded that price, 6*s.* 8*d.*, equal to 8*s.* of preſent money. For the quarter of rye, when not exceeding in price as above, 36*s.*, equal to 2*l.* 3*s.* 2*d.*, the ſum of 1*l.* 6*s.* 8*d.*, equal to 1*l.* 12*s.*; and when it exceeded that price, 5*s.*, equal to 6*s.* of preſent money. For the quarter of peaſe, beans, barley, and malt, not exceeding in price as above, 1*l.* 6*s.* 8*d.*, equal to 1*l.* 12*s.*, the ſum of 1*l.* 6*s.* 8*d.*, equal to 1*l.* 12*s.*; and when it exceeded that price, 5*s.*, equal to 6*s.* of preſent money. Conſequently, Mr. Dirom obſerves, that until the price of wheat *per* quarter was higher than 2*l.* 12*s.* 10*d.* of preſent money, and that of other grain in proportion, from the importation high duties acting as a prohibition, and exportation being in fact prohibited, prices would quickly riſe, and bring the country to import at the low duties; a circumſtance which, he ſays, accordingly happened: "for, in 1660, the quarter of wheat ſold at 2*l.* 16*s.* 6*d.*, equal to 3*l.* 7*s.* 9*d.* of preſent money;" "in 1661, it roſe to 3*l.* 10*s.*, equal to 4*l.* 4*s.*; and in 1662, to 3*l.* 14*s.*, equal to 4*l.* 8*s.* 10*d.* of preſent money." He adds, that theſe laws, in addition to their having raiſed the price of grain to an "extravagant height, had ruined many of the farmers;" and that agriculture declined, a great part of the lands lying without tillage or cultivation.

In conſequence of this, the corn laws were again taken into conſideration in 1663, the preamble to the act concerning which, 15 Cha. II. c. 7. § 1, 2, 3, 4, ſufficiently ſhews the deplorable ſtate into which huſbandry had fallen; and it would ſeem that the legiſlature was now ſeriouſly anxious to afford it encouragement. By this law, the exportation prices were extended beyond their former limits: that of the quarter of wheat being fixed at 48*s.*, equal to 2*l.* 17*s.* 7*d.* of preſent money; the quarter of buck wheat, barley, or malt, 28*s.*, equal to 1*l.* 13*s.* 7*d.*; the quarter of oats, 13*s.* 4*d.*, equal to 16*s.*; the quarter of rye, peaſe, and beans, 32*s.*, equal to 1*l.* 18*s.* 5*d.* current Engliſh money: but the exported grain being ſtill ſuffered to continue loaded with nearly 50 *per cent.* of duties, it operated as a prohibition.

While, on the contrary, the high duties on importation were removed, and when the prices of grain did *not* exceed the ſame rates limited for exportation, or when grain was at the loweſt price, importation was allowed, on the payment of about 9 *per cent.* of duties *ad valorem*, which were much lower than the low duties fixed by the act of tonnage and poundage. Theſe duties were, for every quarter of wheat, 5*s.* 4*d.*, equal to 6*s.* 5*d.* of preſent money; for every quarter of rye, 4*s.*, equal to 4*s.* 10*d*; for every quarter of barley or malt, 2*s.* 8*d.*, equal to 3*s.* 2*d.*; for every quarter of buck wheat, 2*s.*, equal to 2*s.* 5*d.*; for every quarter of oats, 1*s.* 4*d.*, equal to 1*s.* 6*d.*; and for every quarter of peaſe and beans, 4*s.*, equal to 4*s.* 10*d.*

By the introduction of the monoſyllable *not*, in the clauſe of the act which relates to importation, it is obſerved, the meaning of the whole was perverted; as it never could have been the deſign of the framers of the act to allow importation at low duties, till grain had riſen above the prices fixed for exportation; as, until that riſe, the prohibition to ingroſs was taken off, and ſimilar reaſons influenced both caſes.

This is rendered ſtill more probable by a law of Scotland, Cha. II. par. 1. ſeſſ. 3. c. 12. 14. of the ſame year; in which the powers of exportation were extended, reſerving to the king and privy council to reſtrain or prohibit it as they ſhould judge neceſſary; while a duty of about 40 *per cent. ad valorem* was laid upon grain imported, when the prices did not exceed thoſe of exportation, namely, for ilk boll of wheat, under 12*l.*, equal to 1*l.* 4*s.* of preſent money; bear and barley, under 8*l.*, equal to 16*s.* the boll; and oats and peaſe, under 8 *merks*, equal to 10*s.* 8*d.* the boll; with power to the king and council to remit the duties, if the prices ſhould riſe.

In this caſe Mr. Dirom contends, that "the Scotch parliament clearly took the lead in the liberal and wiſe exerciſe of their powers, for the encouraging of agriculture, and thereby procuring plenty and cheapneſs of proviſions." He adds, that "they permitted the exportation of all ſorts of grain, when the prices at home were moderate, upon payment of a ſmall duty; and as long as the prices remained in that ſituation, the duties payable upon importation were equal to a prohibition: and they gave unlimited powers to export cattle, and barrelled fleſhes of all kinds, without the payment of any duties: while, in England, importation was permitted, when the price of corn at home was at the cheapeſt rate, upon payment of a low duty; and the duties upon exportation, when the price of corn was in the ſame ſituation, amounted to a prohibition."

And in 1669, the parliament of Scotland, from reconſidering the ſubject, and finding that the exportation of corn had been impeded by the duty payable upon the ſame, now removed all duties, except a merk the chalder, equal to 1*s.* 4*d.* of preſent money, payable upon corn exported, when the prices at home did not exceed thoſe ſtated in the act of 1663. Cha. II. par. 2. ſeſſ. 1. c. 14. And in order to prevent any debates that might ariſe concerning the reſpective prices of victual, when the ſame were under or above the rates expreſſed in the ſaid act, they recommended to, and authorized, the lords of the privy council to determine the ſame; declaring that it ſhould be lawful for his majeſty's ſubjects to export corns of all ſorts, unleſs prohibited and diſcharged from doing the ſame, by a proclamation or public intimation from the ſaid lords of council.

In 1670, a reviſion of the corn laws again took place, probably in conſequence, as Mr. Dirom ſuggeſts, of the continual drain upon England for the payment of the price of the large quantities of grain imported; and by a law now paſſed,

paſſed, entitled, "An Act for Improvement of Tillage, and the Breed of Cattle, for the common Good and Welfare of the Kingdom," it was enacted as lawful for every perſon, native or foreigner, to tranſport, at any time, as merchandize, all ſorts of corn, although the prices exceeded the rates in the act of the 15th of the preſent reign; paying for the ſame the rates expreſſed in the act of tonnage and poundage. And that in caſes where the prices of grain, at the places of importation, ſhould not exceed the rates, as follows; there ſhould be paid for cuſtom theſe rates, namely, for every quarter of wheat, when the ſame ſhould not exceed 53*s.* 4*d.*, equal to 3*l.* 4*s.* of preſent money, the ſum of 16*s.*, equal to 19*s.* 2*d.*; when the ſame ſhould exceed 53*s.* 4*d.*, and not exceed 4*l.*, equal to 4*l.* 16*s.*, there ſhould be paid 8*s.*, equal to 9*s.* 7*d.*; for every quarter of rye, when the ſame did not exceed 40*s.*, equal to 2*l.* 8*s.*, the ſum of 16*s.*, equal to 19*s.* 2*d.*; for every quarter of barley, malt, or buck wheat, when the ſame did not exceed 32*s.*, equal to 1*l.* 8*s.* 5*d.*, the ſum of 16*s.*, equal to 19*s.* 2*d.*; for every quarter of oats, when the ſame did not exceed 16*s.*, equal to 19*s.* 2*d.*, the ſum of 5*s.* 4*d.*, equal to 6*s.* 5*d.*; and for every quarter of peaſe and beans, when the ſame did not exceed 40*s.*, equal to 2*l.* 8*s.*, the ſum of 16*s.*, equal to 19*s.* 2*d.* And that when the prices of corn ſhould exceed the aforeſaid rates, there ſhould be paid the former cuſtom and poundage: imagined to have been intended to be, by the act of 1663, 5*s.* 4*d.*, equal to 6*s.* 5*d.*, for wheat; 4*s.*, equal to 4*s.* 10*d.*, for rye, peaſe, and beans; 2*s.* 8*d.*, equal to 3*s.* 2*d.*, for barley and malt; and 1*s.* 4*d.*, equal to 1*s.* 6*d.*, for oats. 22 Charles II. c. 13. § 1, 2.

The above mentioned writer ſuppoſes that this law was without doubt deſigned to promote the exportation of Engliſh corn, and to reſtrain, if not prohibit, the importation of grain from abroad; but that the former was completely prevented, from the high duties continued upon it; and that the latter was rendered nugatory, in conſequence of no rule being laid down for aſcertaining the price of grain, at the time or place of importation: of courſe the trade continued to be carried on, on the payment of the low duties; agriculture languiſhed; the dealers finding their account in feeding the populace with foreign grain, the prices of courſe keeping high: the average price of the quarter of wheat, for the ten years preceding this period, having been 2*l.* 8*s.* 10*d.*, equal to 2*l.* 18*s.* 8*d.* of preſent money. It is ſuggeſted that by theſe laws the poorer ſort of farmers became ruined, and the richer were weakened, being neceſſitated to turn their attention from corn to live ſtock, or any other objects by which they could ſupport their families: the price of corn conſequently roſe on the manufacturer and labourer; and the importer of foreign grain became an important man, upon the ruins of the landholders, farmers, and others.

Notwithſtanding this, the reſt of this thoughtleſs and inattentive reign paſſed away without any alteration being made, though it continued for a period of fifteen years afterwards. Grain, of courſe, kept high in price: the average of the quarter of wheat, for the twenty years, from 1660 to 1680, having been 2*l.* 9*s.* 9*d.*, equal to 2*l.* 19*s.* 9*d.* of the preſent money.

In 1685, on the acceſſion of James II., the evaſion of the duties payable on imported corn, and the diſtreſs cauſed by the vaſt importation of grain from abroad, were brought under the conſideration of the legiſlature; and another act for the improvement of tillage paſſed, 1 Ja. II. c. 19, by which the defect of the above law was endeavoured to be obviated; it being there referred to the juſtices of the peace, in the ſeveral counties of England, where foreign grain might be imported, at their quarter ſeſſions, after Michaelmas and Eaſter, on the oaths of two or more ſubſtantial perſons, neither being merchants nor factors for the importation of corn, nor anywiſe concerned or intereſted in the corn to be imported, and each having a free eſtate of 20*l. per annum*, or a leaſehold of 50*l. per annum*, to determine the prices of the ſeveral kinds of grain, which they were to certify to the principal officer of the cuſtoms in the ſeveral counties, for his rule and regulation.

The importation of victual from Ireland had been prohibited in Scotland, under very ſevere penalties, Char. II. par. 2. ſeſſ. 3. c. 3, only reſerving to the lords of the privy council power to admit of it, for ſuch times as they ſhould think proper, when the price within the kingdom ſhould be at or above 8*l.* Scots, equal to 16*s.* of preſent money, for bear and meal; and 10*l.*, equal to 20*s.*, for wheat *per* boll. But in this year, 1686, by the act of Ja. VII. par. 1. ſeſſ. 3. c. 14, a total prohibition was enforced; all victual which ſhould then be imported, being directed to be ſunk or deſtroyed.

It is remarked by the writer we have quoted above, that for the ten years from 1650 to 1660, the average price of the quarter of wheat in this country had been 2*l.* 9*s.* 6*d.*, equal to 2*l.* 19*s.* 5*d.* of preſent money; that from the latter period to 1670, it had been 2*l.* 8*s.* 10*d.*, equal to 2*l.* 18*s.* 8*d.*; from this laſt period to 1680, it had been 2*l.* 10*s.* 8*d.*, equal to 3*l.* 0*s.* 10*d.*; and that from 1681 to 1685 incluſive, it had been 2*l.* 4*s.* 3*d.*, equal to 2*l.* 13*s.* 1*d.*

But the unfavourable tendency of the above ſyſtem of corn laws is more fully ſhewn by the ſcale of prices, fixed by them for the exportation and importation of wheat, in the following tables, from 1360 to 1688, as taken from the above excellent work.

It is conſidered by Mr. Dirom as extraordinary, that the advantage which muſt neceſſarily accrue to a nation from raiſing the utmoſt poſſible quantity of corn, and exporting ſuch portions of it as the conſumption at home does not demand, ſhould, for ſuch a great length of time, have been miſunderſtood in this country; eſpecially ſince the example of the neighbouring ſtates, conſtantly bartering their excreſcent ſtock of this article for the raw materials and money of the kingdom, could ſcarcely have eſcaped notice for ſuch a number of centuries. The importation trade is conſidered as operating, in various ways, in direct oppoſition to the benefit of the country: in conſequence of which, agriculture became in a declining ſtate; much of the ground was without cultivation; there was a decreaſe in the population, a proportionate reduction in the public revenue neceſſarily took place; and the number of remaining manufacturers were of courſe fed at an exorbitant price, by the products of foreign lands, the inhabitants of which were not unfrequently at enmity with us, but who drew vaſt ſums from the country, and thus robbed it of its riches.

But we now approach a period in which a different ſyſtem was acted upon, and in which a very material change took place in the laws reſpecting corn; but which was not accompliſhed by ſimply reviſing or amending the old acts, or by merely reducing the duties upon exported grain, but by at once giving up every idea of revenue from grain raiſed at home; and thus holding out a new ſyſtem which ſhould invigorate and encourage the cultivation of the ſoil, while it afforded a new ſtimulus to the trade and navigation of the country.

In 1688, not long after the acceſſion of William and Mary to the crown, the ſubſequent important act for encouraging the exportation of corn was paſſed, 1 Will. & Mary, c. 12. and ibid. c. 24. § 18, by which exportation was permitted from England, when the prices at home did not exceed the following rates: malt or barley, 24*s.* the quarter, Wincheſter meaſure, equal to 28*s.* 10*d.* of preſent money; rye, 32*s.*, equal to 38*s.* 5*d.* *per* quarter; and wheat, 48*s.*, equal to 2*l.* 17*s.* 7*d.* the quarter; provided it was made in Engliſh ſhipping, the maſter and two-thirds of the mariners, at leaſt, being ſubjects of that ſtate, and the exporter producing a certificate under his hand, of the quantity of grain ſhipped, to the collector of the cuſtoms at the port where the grain had been ſhipped, and proving the ſaid certificate by the oaths of one or more credible perſons; and upon bond, of at leaſt 200*l.* for every 100 tons of corn, that the ſaid grain ſhould be exported to parts beyond the ſeas, and not again re-landed, the exporter ſhould receive the following bounties: for every quarter of barley or malt, ground or unground, 2*s.* 6*d.*, equal to 3*s.* of preſent money; for every quarter of rye, ground or unground, 3*s.* 6*d.*, equal to 4*s.* 2*d.*; for every quarter of wheat, ground or unground, 5*s.*, equal to 6*s.*: and on producing a certificate, under the common ſeal of the chief magiſtrate in any places beyond the ſeas, or under the hands and ſeals of two known Engliſh merchants, that ſuch corn had been actually landed; or upon proof, by credible perſons, that ſuch corn had been taken by enemies, or periſhed on the ſeas, the exporter's bond was to be given up; and the money, paid by the collector or commiſſioner of the cuſtoms, to paſs in his account.

And the ſame ſyſtem of policy was adopted ſoon afterwards in Scotland in 1695, by an act Will. par. 1. c. 32, in which all export duties were taken off, and a bounty of eight merks granted upon ilk chalder of corn exported, when the prices did not exceed the following: wheat twelve pounds the boll equal to 1*l.* 4*s*; bear, barley, or malt, eight pounds, equal to 16*s.* the boll; peaſe, oats, and meal, ſix pounds, equal to 12*s.* the boll; the whole being of Linlithgow meaſure, provided that the exportation was made in Scotch ſhips and by Scotſmen, the maſter and three-fourths of the ſeamen being Scotſmen, power however being reſerved to the lords of the ſecret council, when the prices exceeded the fixed rates, to diſcharge and diſcontinue exportation.

The duties and ſubſidies payable upon exported corn from England, not having been given up by the former act, they were now, 1700, finally removed and taken away by another act, 11 and 12 Will. III. c. 20. § 4, whether upon ground or unground grain.

By this means what has been termed a new ſyſtem of corn laws, was finally eſtabliſhed in both this country and Scotland, and the act of Union taking place ſoon afterwards, 1706, their laws concerning grain were made alike. That when oats ſhall be ſold at 15*s.* ſterling, equal to 18*s.* of preſent money, the quarter or under, there ſhall be paid 2*s.* 6*d.* ſterling, equal to 3*s.* bounty, for every quarter of the oatmeal, ſo long as rewards are granted for exportation of other grains; and that the bear of Scotland have the ſame reward as barley.

It has been already ſeen that the prices and duties of corn imported, had been determined by the act of 1670, but that for want of a rule for aſcertaining the prices at the times and places of importation, the duties were evaded. The act of 1685 was to ſupply this defect; it enjoined and required the juſtices of peace of the ſeveral counties, at their reſpective quarter ſeſſions, to inquire into and determine the prices of grain at fixed periods, and to ſend certificates thereof to the ſeveral cuſtom houſes within their juriſdiction, to be there hung up in a public place for the rule and direction of the parties concerned. But in conſequence of neither the trouble of its execution being compenſated, nor the neglect of it puniſhed, it was in many places unattended to; and from no mode or rule having been ſubſtituted, in ſuch an event, the defect was laid hold of by the importer, and much foreign grain was imported without payment of the duties during 1728 and 1729. And difficulties had likewiſe been met with from the modes employed in aſcertaining the prices and quantities of grain exported.

There being, therefore, in different places a great neglect in the juſtices of peace, to determine the prices of grain, by which the duties on imported corn were to be regulated, the matter was now, 1729, taken up, and they were directed to do it in future, in their reſpective counties, at their next quarter ſeſſions, or any adjournment, according to the act of 1670, and that on their omitting or neglecting to do it, and to certify the ſame, the collectors of the cuſtoms at the reſpective places of importation, were empowered to demand and receive the duties according to the loweſt price of the ſeveral ſorts of corn mentioned in the laſt named act.

And to aſcertain the quantity of grain ſhipped, for which a bounty was to be paid, in a better manner, the proper officers of the cuſtoms were directed to admeaſure the ſame, by a tub, or meaſure, containing four Wincheſter buſhels; and when ſuch corn to be exported was brought to be ſhipped off in ſacks, they were empowered to make choice of any two of them out of twenty, and in that way compute the quantity to be ſhipped, on which the bounty was to be paid: And that the ſame powers ſhould be employed in aſcertaining the prices and quantity of bear, bigg, oatmeal, and malt, made from wheat or wheat malt, for being exported, 2 Geo. II. c. 18. § 1, 2, 3, 4, 5. That in all ſuch caſes, as where any corn or grain had been imported ſince the firſt day of the Michaelmas quarter ſeſſion, then laſt paſt, where the importers or proprietors had omitted to pay the reſpective duties on the ſame on demand, they ſhould forfeit and loſe all ſuch grain, or the value of it.

Notwithſtanding this, neglects ſtill frequently occurred in determining the prices of grain, according to which the duties payable on importation were to be levied, and of courſe the means were afforded of much foreign grain being brought in, though the prices at home were very low; conſequently another act was now, 1732, paſſed, for the *better aſcertaining the ſame, and preventing fraudulent importation*, in which it was again recommended to the juſtices of peace, at their quarter ſeſſions, in the ſeveral counties where foreign grain ſhould or might be imported, to give in charge, to the grand jury, in the open court, to make inquiry and preſentment, upon their oaths, of the common corn market prices, of middling Engliſh corn and grain, of the reſpective ſorts and quantities mentioned in the act, made in the 22d year of the reign of king Charles II. as the ſame ſhould be commonly bought and ſold, in every ſuch county, which preſentment ſhould be certified by the ſaid parties, in writing, to his majeſty's chief officer and collector of the cuſtoms for the time being, at every ſuch port, place, or haven, where importation ſhould be made, and which ſhould be hung up in ſome public place in the cuſtom houſe, for general information and inſtruction: and that the cuſtom duty upon foreign grain imported, as directed by the above act of Charles II., ſhould be collected and paid, according to the prices contained in ſuch certificate. But that after importation, no foreign corn or grain was to be exported, or in any manner or ſhape laden on ſhip board, or put to ſea, for carrying, conveying, or tranſporting it from one part or port of the kingdom to another, either by itſelf or in mixture with Engliſh corn, under the very ſevere penalties and forfeitures therein mentioned. 5 Geo. II. c. 12.

It is ſtated by Mr. Dirom, in his very able "Inquiry into the Corn Laws and Corn Trade," that at this period agriculture had conſiderably recovered its ſtrength, and that the exertions of the farmers had become vigorous and conſtant. That the prices of corn for ſeveral years preceding it had been very reaſonable, and that a great export trade in corn had been carried on from this country; proper attention having been paid to the execution of thoſe laws which were made to guard againſt fraudulent importations: the average price of the quarter of wheat, for the five years from 1731 to 1735 incluſive, being only 34*s.*; in 1736, 40*s.*; in 1737, 38*s.*; and in this year 1738, only 35*s.* 6*d.* yet under theſe plentiful circumſtances, the lower orders of the populace were excited to commit various outrages, by which the corn was deſtroyed. Therefore, in order to repreſs ſuch diſorders, an act was paſſed, 11 Geo. c. 22, by which ſuch offenders were ſeverely puniſhed, and the inhabitants of the hundreds, in which ſuch outrages ſhould be committed, ſubjected to the payment of the damages.

The power of ſuſpending the laws, in Scotland, which were made to prohibit the importation of foreign grain, or to buy, ſell, or retail the ſame, which had reſted on the act of 1703, and the two preceding ones therein referred to, having been formerly veſted in the privy council of that kingdom; in conſequence of the prices of grain having riſen in 1740, from the ſeverity of the winter, and ſome importation of foreign grain made contrary to law, from there exiſting no power of ſuſpending the prohibitory acts there, on account of the act of the ſixth Anne, c. 6. having done away the privy council, a temporary expedient without any new plan was now, 1741, had recourſe to, and a law made, which transferred ſuch power to the courts of ſeſſion, juſticiary, and exchequer; the judges in theſe courts being required to determine on the neceſſity of exportation or importation, from the prices of grain in the county of Edinburgh. The duties payable in England by the act of the 22 Charles II. being required by the ſame law to be paid on the importation of grain into Scotland; the whole of the clauſes and proviſions of that act, as well as of that of the 2 George II., termed "An act to aſcertain the cuſtom payable on Corn imported, being extended to Scotland."

Difficulties having ariſen concerning the computation and meaſurement of wheat, meal, and other ground corn, on which a bounty was payable upon exportation, in order to adjuſt all differences ariſing thereon, by a law now (1751) made, the officers of the cuſtoms were empowered to allow the ſame bounty on the exportation of 224 pounds weight of wheat meal, or other ground corn or grain, as was allowed upon the exportation of four buſhels of wheat, or other corn or grain, unground; and for the more effectually expediting the buſineſs, they were permitted to make choice of any two ſacks out of twenty, from which to compute the weight. 24 Geo. II. c. 56. § 1.

Theſe laws had greatly contributed to the extenſion of the export trade in grain, while plenty continued at home, with moderate prices. It is ſtated, that the average exportation of four years, from 1748 to 1751 incluſive, was 1,212,686 quarters annually; and that the average price of wheat, for the ſame four years, was 36*s.* 3*d.* the quarter.

From the money, applicable to the payment of the bounty, becoming inadequate to the diſcharge of the ſums due on ſuch extenſive exportations, an act was now (1753) paſſed, 26 Geo. II. c. 15, by which the debentures, for the bounties on exported corn, were to carry an intereſt, when not paid within ſix months, at the rate of 3 *per cent. per annum*, according to the regulations of the act of the 12 and 13 of king William.

The crop of 1756 being defective and the prices of courſe riſing, the populace from being long in the habits of plenty, miſtaking the cauſe, committed various outrages in different places. And a law was brought forward in 1757. 30 Geo. II. c. 1, by which all ſorts of corn, meal, malt, flour, bread, biſcuit, or ſtarch, were prohibited exportation, before the 25th December 1757, except malt made to be exported, and declared to be ſo before the 4th December 1756, ſhips cleared out with it before the 25th being ſuffered to proceed on their voyages: power was however reſerved to the king to remove the prohibition by proclamation, and to admit all perſons, natives as well as foreigners, but no particular perſon or perſons, to export grain. All duties, cuſtoms, rates, and impoſitions of every kind, on corn or flour, imported, or taken from the enemy and brought into the kingdom, were diſcontinued until the 24th of Auguſt 1757; and the ſame might be carried coaſtways free of duty, 30 Geo. II. c. 7, and importation without duty was permitted alſo in ſhips of other friendly nations from any port or place whatever, 30 Geo. II. c. 9. § 14. After 11th March 1757, the diſtillation of low wines and ſpirits from any wheat, barley, malt, or any other ſort of grain, or from any meal or flour, was prohibited during the ſpace of two months, 30 Geo. II. c. 10. and it was afterwards continued to the 11th December in the ſame year; but with power to his majeſty to ſuſpend the act and permit it, by proclamation or an order of council. 30 Geo. II. c. 15.

By theſe laws and regulations, the exportation of corn is ſtated to have been completely checked, the quantity of about 80,000 quarters having been exported, previouſly to the prohibition, and about 150,000 quarters of foreign grain brought in.

There was however a reſtoration of the exportation trade in 1759 it proceeding as uſual, with but little importation of foreign corn, but in conſequence of the crop of 1762, being a little deficient, importation took place from the riſe of prices, which at the low duties was capable of being done, and of courſe was conſiderable, during that and the three years which followed it. During the laſt, from ſome cauſe of fear, an embargo was laid upon all ſhips loaden with corn for exportation, the 26th of September, but which having been done contrary to law, it was neceſſary to paſs an act of indemnity for it in the following year 1766, the 7 Geo. III. c. 7. On this it is remarked by the writer quoted above that there does not now ſeem to have been any ſufficient ground for thoſe meaſures; as in the year ſtated there were more than 300,000 quarters of grain exported, and under 250,000 imported.

In 1767, prohibitory laws were paſſed for a limited period, for the prevention of the exportation of corn, grain, meal, flour, bread, biſcuit, and ſtarch, as well as the extraction of low wines, and ſpirits from wheat and wheat flour. Alſo a law for permitting, for a limited time, the importation of wheat and wheat flour, oats, and oatmeal, rye, and ryemeal without duty. 7 Geo. III. c. 3, 4, 5, 8. And in 1768 the ſame laws were renewed, having ſome additions made to them; it being now enacted that they ſhould continue in force until twenty days after the beginning of the next ſeſſions of parliament, or the exportation of the above different articles, as well as their diſtillation and preparation from wheat or wheat flour, was prohibited, except to particular Britiſh dependencies. And the importation both of wheat, wheat flour, barley, barleymeal, pulſe, oats, oatmeal, rye, ryemeal, from any part of Europe, and maize or Indian corn and rice from North America, as well as wheat and wheat flour from Africa, were allowed without any duty. 8 Geo. III. c. 1, 2, 3. And in 1769, the prohibition was continued until twenty days after the meeting of the next ſeſſions of parliament, but the importation of rice from North America permitted duty free.

But in 1770 the former law of the preceding year, prohibiting the exportation of corn, grain, meal, malt, flour, bread, biſcuit, and ſtarch, and alſo the extraction of low wines and ſpirits from wheat or wheat flour, was continued in force until twenty days after the commencement of the enſuing ſeſſion of parliament, provided that the ſaid continuation might be abridged, and this act, or any part of it, altered and varied by any other act or acts to be enacted in the preſent ſeſſion. 10 Geo. III. c. 1. Conſequently by another law of this ſeſſion, thoſe parts of the former acts, which prohibited the exportation of malt, were repealed. 10 Geo. III. c. 10. And an act was likewiſe paſſed for regiſtering the prices at which corn was ſold in the ſeveral counties of Great Britain, as well as the quantity exported and imported. 10 Geo. III. c. 39. And in 1771 prohibitory laws againſt the exportation and extraction of the above different articles were again paſſed, 11 Geo. III. c. 1. (with the exception of victualling ſhips, on their being ſent to Britiſh dependencies) to be in force till the twentieth day after the meeting of the next ſeſſion of parliament. On the meeting of the ſeſſion of parliament in the following year (1772), a prohibitory law was again paſſed, againſt the exportation and extraction of the ſame articles, to be in force till the twentieth day after the meeting of the next ſeſſion of parliament. Afterwards an act was likewiſe paſſed, permitting the importation of wheat, wheat flour, rye, ryemeal, and Indian corn, without duty, until the firſt day of December in the ſame year.

It is conſidered by the able inquirer into the corn laws and corn trade mentioned above, that all this would ſeem to have been had recourſe to without any ſufficient grounds, as the price of grain was not by any means very high, and the quantity exported from the year 1760 to 1770 greatly exceeded that which was imported.

On the meeting of parliament in 1773, an act was, however, paſſed, by which a free importation was permitted before the firſt day of January in the following year, for any wheat, wheat flour, rye, ryemeal, barley, barleymeal, oats, oatmeal, peaſe, beans, tares, calivancies, and all other ſorts of pulſe, from any part of Europe or Africa; and permiſſion to carry the ſame coaſtways, under ſimilar regulations to thoſe of wheat or wheat flour the growth of this country, provided due entries were made according to the previous practice of the kingdom; and likewiſe for the free importation of wheat, wheat flour, Indian corn and meal, biſcuit, peaſe, beans, tares, calivancies and all other ſorts of pulſe, from North America, under the ſame regulations. And another prohibitory law was enacted, 13 Geo. III. c. 1, 2, 3, preventing the exportation and extraction of all the above named articles, wines and ſpirits, except for victualling ſhips, or to Britiſh dependencies, until the firſt day of January 1774.

Theſe laws, though radically injurious to the agriculture of the country, are conceived by Mr. Dirom, from their not trenching on the general ſyſtem, as only productive of a temporary effect which might have been overcome.

By another law of the ſame year 1773, the 13 Geo. III. c. 40. ſuch alterations and changes were however made, by the reduction of the export and import prices, and the rendering the duties on importation a mere trifle, that a *new ſyſtem* ſeems to have been introduced and eſtabliſhed in the corn laws, deſtructive of the *old code* by which ſuch benefits had accrued to the agriculture and commercial induſtry of the country; and by which, beſides producing plenty and reaſonable prices at home, by the diſpoſal of the excreſcent ſtock in foreign markets, vaſt ſums of money had been brought into the kingdom. The manner in which that uſeful code had been gradually raiſed, formed, and matured by experience, through a vaſt length of time, and finally eſtabliſhed by the laws of 1670, 1688, and 1706, has been amply ſhewn in the preceding part. But in order to place the *different ſyſtems* in a better point of contraſt, and thereby afford a more diſtinct notion of their nature and principles, the excellent comparative tables introduced below, have been drawn from Mr. Dirom's "Inquiry into the Corn Laws, &c."

TABLE.—Old Syſtem of Laws for Importation of Grain.

	Importation Prices and Duties.	Money of the Time.						Preſent Money.					
		Prices.			Duties.			Prices.			Duties.		
		£.	s.	d.	£.	s.	d.	£.	s.	d.	£.	s.	d.
	For every quarter of wheat, when the prices did not exceed	2	13	4	0	16	0	3	4	0	0	19	2
	when above that price, and not exceeding	4	0	0	0	8	0	4	16	0	0	9	7
	when above that price	0	0	0	0	5	4	0	0	0	0	6	5
1670	For every quarter of rye, peas, and beans, when the price did not exceed	2	0	0	0	16	0	2	8	0	0	19	2
	when above that price	0	0	0	0	4	0	0	0	0	0	4	10
	For every quarter of barley, when the price did not exceed	1	12	0	0	16	0	1	18	5	0	19	2
	when above that price	0	0	0	0	2	8	0	0	0	0	3	2
	For every quarter of oats, when the price did not exceed	0	16	0	0	5	4	0	19	2	0	6	5
	when above that price	0	0	0	0	1	4	0	0	0	0	1	6

TABLE.—New Syſtem of Laws for Importation of Grain.

	Importation Prices and Duties.	Prices.			Duties.		
		£.	s.	d.	£.	s.	d.
1773	For every quarter of wheat, when the price was at or above	2	8	0	0	0	6
	100 weight of wheat flour	0	0	0	0	0	2
	quarter of rye, peas, or beans, when the price was at or above	1	12	0	0	0	3
	barley, bear, or bigg, when the price was at or above	1	4	0	0	0	2
	oats, when the price was at or above	0	16	0	0	0	2

It is remarked by the able writer, in reſpect to theſe tables, that, according to the *old laws*, but eſpecially that of 1670, importation was not allowed till the prices at home were very high, and then even the duties were great, in conſequence of which, foreign corn could be only introduced for the ſupply of times of ſcarcity, never being able to come in competition with the home produce. That, the law of 1688 did not even notice importation; it being ſolely enacted for the purpoſe of promoting and encouraging the agriculture of the country, by affording a new market for the ſuperabundant grain, and in that way giving a new ſtimulus to the exertion of the people, to bring the waſte and barren lands into a ſtate of profitable cultivation: The buſineſs of importation being left to the laws which previouſly exiſted, by which it was ſuppoſed to be ſufficiently reſtricted, if not wholly prohibited.

It is obſerved further, that at the time thoſe laws were paſſed, and till 1714, the intereſt, borne by money, was 6 *per centum per annum*, being of courſe proportionally of greater value than at preſent, when the intereſt is only 5 *per cent. per annum*. Beſides, the old acts did not, in fact, admit the importation of flour or ground corn at any period; only the grain at certain places, where the prices ſhould happen to be very high. Neither did they allow the carrying of imported grain by ſea, coaſtways, nor the tranſporting of it to any other place, except that to which neceſſity had brought it; reſtrictions which ſeemed ſo eſſential as to require being enforced, under very ſevere penalties, by the act of the 5th of George II.

But that the *new law*, or that of 1773, commences with importation, and directs that, at any time when the price of the middling ſort of Britiſh grain ſhall be at the prices ſtated in the above tables, at the ſeveral ports and places where the ſame ſhould be imported; then all cuſtoms and duties, formerly payable on wheat, wheat flour, rye, peaſe, beans, barley, bear, bigg, and oats, imported into the kingdom, ſhould ceaſe and be no longer payable, while theſe prices continued. That, inſtead of the former duties, thoſe ſtated in the above table, ſhould only be paid. It was likewiſe enacted, that the importation of oatmeal from Ireland, or any other part beyond the ſeas, into any port or place in Scotland, ſhou'd be lawful, where the price of oatmeal exceeds 16*s.* the boll of 8 ſtone, troy weight.

Further, that by the new law importation is admitted, when the prices of grain at home are at ſuch a reduced rate, as that foreign corn may always come in competition with the home produce in the markets, an evil that has conſtantly exiſted ſince the paſſing of the act; beſides, by this law, wheat and other grain imported, may be conveyed coaſtways, and entered and landed in any other parts of the kingdom, at which the prices of middling Britiſh corn, grain, or flour, are at or above the reſpective rates ſtated in the table given above, under ſuch regulations as wheat, wheat flour, rye, peaſe, beans, barley, bear, bigg, or oats, the growth of this kingdom, are permitted to be conveyed coaſtwiſe. Alſo, that on importing corn, grain, or flour, and paying the duties, where the ſame ſhall be again exported within ſix months, the duties were to be drawn back and repaid.

TABLE.—Old Laws for the Exportation of Grain.

	Exportation Prices and Bounties.	Money of the Time.						Preſent Money.					
		Prices.			Bounties			Prices.			Bounties.		
		£.	s.	d.	£.	s.	d.	£.	s.	d.	£.	s.	d.
1688	Upon every quarter of wheat, ground or unground, when the prices were at or under	2	8	0	0	5	0	2	17	7	0	6	0
	of rye, when the price was at or under	1	12	0	0	3	6	1	18	5	0	4	2
	of barley or malt, when the price was at or under	1	4	0	0	2	6	1	8	10	0	3	0
1706	of oatmeal, when the quarter of oats is at or under	0	15	0	0	2	6	0	18	0	0	3	0

TABLE.—New Laws for the Exportation of Grain.

	Exportation Prices and Bounties.	Prices.			Bounties.		
		£.	s.	d.	£.	s.	d.
1773	Upon every quarter of wheat, or malt of wheat, when the price is under -	2	4	0	0	5	0
	of rye, when the price is under - - - -	1	8	0	0	3	0
	of barley, bigg, or malt made thereof, when the price is under -		2	0	0	2	6
	of oats, when the price is under - - -	0	14	0	0	2	0
	And for every quarter of oatmeal, conſiſting of 276 *lbs.* avoirdupois - -	0	0	0	0	2	6

The proviſions of the *old laws* of 1688 and 1706, have been already ſo fully ſtated and conſidered, that nothing further than what is contained in the above table ſeems requiſite here.

Under the *new law* it was enacted, that, when the price of the quarter of wheat was at, or above, 44*s.*; rye, peaſe, and beans, 28*s.*; barley, bear, and bigg, 22*s.*; and oats, 14*s.* no ſuch corn or grain ſhould be tranſported or conveyed out of the kingdom, under ſevere penalties. That after the 1ſt day of January 1774, the bounties formerly allowed by law upon grain exported, ſhould ceaſe and determine; and that, in the place thereof, when the prices of it ſhould be under the rates ſtated below, at the ports and places, whence the ſame ſhould be ſhipped, there ſhould be allowed, on the exportation of ſuch grain, either ground or unground, being the growth of this kingdom, and ſhipped in Britiſh ſhips, the maſter, and at leaſt two-thirds of the mariners of ſuch ſhips being ſubjects of his majeſty, theſe bounties; that is to ſay, when the price of middling Britiſh wheat is *per* quarter under 44*s.* a bounty for every quarter of wheat, or malt made from it, 5*s.*; when the quarter of rye was under 28*s.* a bounty of 3*s.*; when the quarter of barley, bear, or bigg, was under 22*s.* a bounty of 2*s.* 6*d.* for every quarter of them, or of malt made from them, and when the quarter of oats was under 14*s.*, a bounty of 2*s.* on every quarter, and 2*s.* 6*d.* upon every quarter of oatmeal, conſiſting of 276 pounds avoirdupois weight.

Further, that, by the old laws, the juſtices of peace were to aſcertain the prices at their quarter ſeſſions, which, by the new law, was continued the ſame for England; but for Scotland it was transferred to the ſheriffs of the different counties to be aſcertained four times in every year, certificates of which were to be ſent to the cuſtom-houſes within their juriſdiction reſpectively, ſo as to regulate the payment of the export and import bounties and duties.

However, ſo far as exportation was concerned, thoſe rules were, in 1774, wholly altered, it being enacted, that the prices of exported corn, grain, and oatmeal ſhould be regulated and directed according to the average prices, at which they ſhould be reſpectively ſold in the public market at or neareſt to the port or place whence they ſhould be intended to be exported, on the market day preceding that of their being ſhipped, and the bounties to be payable accordingly.

From the comparative ſtatements given in the above tables, the difference in the principles and operations of theſe different ſyſtems of laws, will be eaſily underſtood, the former being calculated for the promotion of cultivation at home, and preventing the importation of foreign corn, unleſs called for by neceſſity; while the latter is formed for the purpoſe of promoting the importation of grain from abroad, whether there may be any neceſſity for it or not. Thus the foreign cultivator is allowed the liberty of importing his flour into the country almoſt free from duty, while the bounty upon flour or meal produced from wheat is taken off.

But in order to expedite and render the conception of the various laws, which have been detailed above, more eaſy and familiar, we ſhall here introduce the tabular view of them given by the author of the "Inquiry into the Corn Laws and Corn Trade," as brought down to the year 1773.

TABLE.

Anno Dom.	Anno Regis	Abbreviation of Engliſh Exportation Laws.
1360	34 Ewd. III.	Exportation prohibited.
1393	17 Rich. II.	Allowed, upon payment of the ordinary ſubſidies and duties.
1425	4 Hen. VI.	The laſt law confirmed, but reſerving power to the king and council to reſtrain it.
1436	15 Hen. VI.	Allowed, when wheat did not exceed 6*s.* 8*d.* and barley 3*s. per* quarter.
1442	20 Hen. VI.	The laſt act confirmed for 10 years.
1444	23 Hen. VI.	And that act now made perpetual.
1552	5 & 6 Ed. VI.	Prohibited, until the prices were at or under 6*s.* 8*d.* for wheat, 3*s.* 4*d.* for barley and malt, 2*s.* for oats, 4*s.* for peaſe and beans, and 5*s.* for rye *per* quarter.
1554	1 & 2 P. & M.	Prohibited, when the prices did not exceed 6*s.* 8*d.* for wheat, 4*s.* for rye, and 3*s.* for barley *per* qr.
1562	5 Eliz.	Allowed, when the prices did not exceed 10*s.* for wheat; 8*s.* for rye, peaſe, and beans; 6*s.* 8*d.* for barley and malt, *per* quarter.
1570	13 Eliz.	Allowed, under the direction of preſidents, &c. upon payment of duties.
1593	35 Eliz.	Allowed, when the prices did not exceed 20*s.* for wheat, 13*s.* 4*d.* for rye, peaſe, and beans, 12*s.* for barley and malt, upon payment of a duty of 2*s.* for every quarter of wheat, and 16*d.* for every quarter of other grain.
1604	2 James I.	Allowed, when the prices did not exceed 26*s.* 8*d.* for wheat, 15*s.* for rye, peaſe, and beans, and 14*s.* for barley and malt *per* quarter; and upon payment of the ſame duties

Anno Dom.	Anno Regis.	Abbreviation of Engliſh Exportation Laws.
1623	21 James I.	Allowed, when the prices did not exceed 32*s.* for wheat; 20*s.* for rye, peaſe, and beans, barley and malt *per* quarter, and upon payment of the ſame duties.
1627	3 Charles I.	Allowed upon the ſame terms with the laſt act.
1660	12 Charles II.	Allowed, when the prices did not exceed 40*s.* for wheat; 24*s.* for rye, peaſe, and beans; 20*s.* for barley and malt, and 16*s.* for oats, upon payment of the ſame high duties.
1663	15 Charles II.	Allowed, when the prices did not exceed 48*s.* for wheat, 32*s.* for rye, peaſe, and beans, 28*s.* for barley and malt, and 13*s.* 4*d.* for oats *per* quarter, upon payment of the ſame high duties.
1670	22 Charles II.	Allowed, without limitation of prices, upon payment of the ſame high duties.
1688	1 W. & M.	Not only allowed, when wheat was not above 48*s.* rye 32*s.* and barley and malt 24*s.* *per* quarter; but bounties granted.
1699	10 Will. III.	Prohibited for one year, from the 10th February 1699.
	11 Will. III.	Bounty ſuſpended from 9th Feb. 1699, to 29th September 1700.
1700	11 & 12 W. III.	The ſubſidy and all the duties payable upon corn and grain, ground and unground, bread, biſcuit, and meal given up and totally removed.

TABLE.

Anno Dom.	Anno Regis.	Abbreviation of Britiſh Exportation Laws.
1706	5 Anne.	Union ſettled-Engliſh bounties adopted over all the kingdom, and extended to oatmeal, bigg, and malt of wheat.
1709	8 Anne.	Exportation prohibited, until the 29th Sept. 1710.
1729	2 Geo. II.	Rules laid down for meaſuring corn to be exported, and for aſcertaining the prices, &c.
1732	5 Geo. II.	Grand juries at ſeſſions, to prevent the price of corn, and corn imported, not to be again exported, nor carried coaſtways.
1741	14 Geo. II.	Prohibited until the 25th Dec. 1741.
1751	24 Geo. II.	Bounties upon corn exported in meal, to be paid according to the weight, at the rate of 448 pounds for the quarter
1753	26 Geo. II.	Money due upon debentures for corn exported, to bear intereſt at 3 *per cent per annum*, if not paid in ſix months after preſenting the certificate.
1757	30 Geo. II.	Prohibited until the 25th Dec. 1757. but with power to the king and council to take off the prohibition
1757	31 Geo. II.	Corn-market eſtabliſhed at Weſtminſter; and, the ſame year, an aſſize made for bread.
1766	6 Geo. III.	Exportation prohibited for a limited time; and, ſame year, an embargo laid upon ſhips loaded with corn for exportation; and ſame year, the mayor and aldermen of London empowered to determine the prices of corn in January and July. as well as in April and October.
1767	7 Geo. III.	Exportation of grain, and diſtilling from wheat or wheat-flour, prohibited from the 26th Sept. to the 14th Nov. 1767.
1768	8 Geo. III.	Exportation of corn, and diſtilling from wheat or wheat-flour, prohibited until 20 days after the commencement of the next ſeſſions of parliament.
1769	9 Geo. III.	Five thouſand quarters of bigg allowed to be exported from the iſlands of Orkney, yearly; and, ſame year, exportation of grain and diſtilling from wheat or wheat-flour prohibited for a limited time.
1770	10 Geo. III.	Corn regiſter eſtabliſhed; and weekly returns, from market-towns in the ſeveral countries, to be made of the prices of wheat, rye, barley, oats, and beans, in England; and of bear or bigg in Scotland. Same year the exportation of corn, and the diſtilling from wheat or wheat-flour, prohibited till 20 days after the commencement of the next ſeſſion of parliament.
1771	11 Geo. III.	Exportation of corn prohibited, and alſo the diſtilling from wheat or wheat-flour, until 20 days after the commencement of the next ſeſſion of parliament.
1772	12 Geo. III.	Exportation of corn, and diſtilling from wheat and wheat-flour, prohibited until 20 days after the commencement of next ſeſſion of parliament.
1773	13 Geo. III.	Exportation of grain, and diſtilling from wheat and wheat-flour, prohibited until the 1ſt day of Jan. 1774. Same year, the former bounties and duties repealed, and a total alteration made in the corn laws.
1774	14 Geo. III.	Alteration of the method of aſcertaining the prices of corn to be ſhipped for exportation.

1672	24 Charles II.	Importation of victual from Ireland prohibited under ſevere penalties.
1687	3 James VII.	Prohibition to import victual from Ireland renewed, and victual ſo imported ordered to be deſtroyed.
1703	2 Anne.	Importation of victual prohibited from foreign parts, until the price of the boll of grain exceeds 12*l.* for wheat, 8*l.* for bear, meal, and malt, and 6*l.* for oats and peaſe; but with power to the lords of the privy council to ſuſpend this prohibition when neceſſary.
1741	14 Geo. II.	Importation permitted, when the prices of grain, in the county of Edinburgh, exceeded 40*s.* for wheat; 20*s.* for peaſe and beans; 18*s.* for bear and barley; and 13*s.* 4*d.* for oats, *per* quarter, and 8*l.* Scots, *per* boll, for oatmeal, upon payment of the duties fixed by the Engliſh acts of the 22d Charles II.

TABLE.

Anno Domini.	Anno Regis.	Abbreviation of Scotch Exportation Laws.
1555	13 Mary.	Exportation of grain prohibited under ſevere penalties.
1587	20 James VI.	Prohibited.
1663	15 Charles II.	Exportation of grain permitted when the price of victual at home was under 12*l.* for wheat, 8*l.* for bear and barley, and 8 merks for peas and oats, *per* boll; upon payment of the uſual duty.
1669	21 Chaˢ II.	All duties payable upon grain exported removed, except one merk *per* chalder upon every kind of victual.

1706	5 Anne.	The ſame bounties with England. -				

As it would appear from what has been advanced in the preceding pages, that on the experience of a great length of time, it would ſeem that the laws and regulations in reſpect to grain, which were brought forward under the acts of 1670, 1688, 1706, and 1732, had conſiderable influence and effect in promoting the improvement of agriculture, increaſing the quantity of corn, and thereby preventing the neceſſity of having recourſe to *importation* for a precarious and uncertain ſupply; it may not only be proper to afford the following tabular view from the valuable work quoted above, of the prices, bounties, and duties, as laid down by them, by which their principles and objects may be more clearly comprehended, but alſo to contraſt them with the regulations concerning thoſe which have been enacted by the law of 1791.

TABLE.—Prices, Bounties, and Duties, on Exportation and Importation of Grain by the former Acts.

N. B.—Flour, meal, and malt, are regulated in proportion to the ſeveral ſorts of grain. The importation of malt is at all times prohibited.

* The bounty, by the tables in the act of parliament, appears to be given only upon rye, and not alſo upon the exportation of peas and beans.

It has been obſerved on theſe tables, by Mr. Mackie, that though the import prices and duties are higher in a ſmall degree in the latter, than was the caſe in the act of 1773, which is ſo far returning to the old ſyſtem, yet that the encouragement held out to the huſbandman is conſiderably leſs, than was the caſe under the ancient regulations. Without conſidering the difference in the value of money between the periods, it may be noticed, he ſays, that the bounty of 5*s.* on wheat, is now withdrawn when it reaches 44*s.*, and exportation ſtopped when it advances to 46*s.* the quarter; while, by the old laws, exportation, with the bounty, was continued till the price reached 48*s.*

And importation, by this act, is permitted on low duties, when the price of wheat advances to 2*l.* 10*s.*; while, by the old acts, the duties were equal to a prohibition, until the price reached 4*l.*, and even then, the duty was high, inſtead of being reduced to almoſt nothing, as is now the caſe, before wheat reaches a price capable of repaying the farmer in an unfavourable ſeaſon. In fact, it is contended, that agriculture has derived little protection or ſupport from the late laws, its continued proſperity depending rather on the impoſſibility of procuring adequate ſupplies of grain from abroad, by which the farmers in this country have, in a great degree, retained the monopoly of the markets, than the countenance it has received from the legiſlature.

Since the period already noticed, however, the above plan has been relinquiſhed, and different changes and alterations have been made in the corn laws, by which it would ſeem that ſome parts of the old ſyſtem have been again in ſome meaſure reverted to.

The act of 1773, by ſo greatly lowering the rates and duties on the importation of foreign grain, had contributed to fix and eſtabliſh the import ſyſtem, and ſpeculation in corn, under the direction of the merchants, by which, from the prices of grain in the markets abroad, being commonly ſo much below thoſe of this country, they were conſtantly ready, by ſome contrivance or other, to open the ports, before the price of the home grain in the markets, came to the rate at which foreign grain was permitted to be imported. It conſequently became neceſſary, from time to time, to paſs acts, in order to counteract ſuch deſigns, and render the general law more efficient.

Accordingly, in 1781, an act was made, 21 Geo. III. c. 50, by which ſo much of the acts of the 1 Ja^s. II.; 5 Geo. II.; 6 Geo. III.; and 14 Geo. III., as related to the aſcertaining of the prices of medium Engliſh wheat, and other grain, in the port of London, and counties of Kent and Eſſex, was repealed; and, in the place of which, an inſpector was appointed, to fix the weekly average prices, from the actual ſales in the ſaid port; by which exportation, and the bounties paid thereon, were to be regulated. But beſides this, an average price is directed to be made up from the weekly returns of each three months, on the firſt day of the ſeſſions held in London, in January, April, July, and September, for the purpoſe of regulating importation for three months, and the duty payable thereon, in the port of London, and the above-mentioned counties. And, in 1783, the law reſpecting corn was ſuſpended, importation being permitted at low duties, and exportation prohibited, till the 25th Auguſt of the ſame year, in England, and the 25th of September in Scotland. 23 Geo. III. c. 1, 53, 81.

In 1789, an act was paſſed, 29 Geo. III. c. 38., for improving and extending the act of the 21 Geo. III. c. 50, by which every corn-factor in London, and the ſuburbs, was neceſſitated to give in weekly returns of his ſales to the inſpectors; and importation was permitted into London, Kent, and Eſſex, when the prices of middling Britiſh grain reached the rates fixed in the act of 1773, as formed from the ſix laſt weekly returns in the port of London, immediately preceding the quarterly ſeſſions, with the exception of oats, which as formerly was directed to be regulated by twelve weekly returns: the act being extended to the maritime counties of England, which were divided into eleven diſtricts. The inſpectors of corn returns, were to be appointed by the juſtices of peace in each county, and directed to make weekly returns of the prices of grain, from not more than twelve, or leſs than eight market towns in each county, the average prices, made from the weekly returns, being directed to be ſent to the collectors of the ports in the diſtrict, for regulating exportation; and the average prices for the whole diſtrict, formed from the ſix weekly returns, immediately preceding the firſt day of February, of May, of Auguſt, and of November, were to regulate the importation of foreign grain and the duties paid thereon.

In 1790, an act of indemnity, 30 Geo. III. c. 1, was paſſed, for abrogating the corn laws, in purſuance of orders from the privy council of the 11th and 18th of November, 23d of December 1786, 2d and 8th of January 1790, by which the above orders are confirmed, and the laws reſpecting corn ſuſpended; no ſort of Britiſh grain being permitted to be exported, except the particular ſpecified quantities for the uſe of the ſugar colonies; but all kinds of foreign grain permitted to be brought freely into every port in the kingdom at the low duties; the act being to continue in full force, until the 29th of September in this year.

And, by the 30 Geo. III. c. 43, the execution of theſe laws was further ſuſpended, until the 28th February 1791, full powers however being given to the privy council, to admit the exportation of all kinds of Britiſh grain, whenever it judged it neceſſary. Further, by the 31 Geo. III. c. 4. the two preceding acts were amended; and, by the introduction of a clauſe in the general corn law, paſſed this ſeſſion, they were continued in full force until its commencement on the 15th of November 1791.

It is remarked by Mr. Mackie, in his "Letters on the Corn Laws," that none of theſe acts for rendering the law of 1773 more efficient, were extended to Scotland, the conſequence of which was, that from the average prices not being fixed and determined by the actual ſales, whenever the ports were opened for the importation of grain from abroad into it, it conſtantly took place, when the current price of produce there was greatly under the reduced rates at which that act even admitted the importation of foreign corn; namely, wheat at 48*s.* the quarter, Wincheſter meaſure, &c. And that, on the contrary, when the overplus quantity of corn was in ſuch abundance, as to permit exportation, the ports there were conſtantly ſhut, before the price of the home produce reached the limit at which exportation ceaſes; both of which caſes operate unfavourably for the agriculture of the country.

In 1791, an act for a new general corn law was paſſed, 31 Geo. III. c. 30., commencing on the 15th of November of the ſame year, by which the 1 Ja^s. II. c. 19.; 1 Gul. & M. c. 12.; 5 Geo. II. c. 12.; 10 Geo. III. c. 39.; 13 Geo. III. c. 43.; 21 Geo. III. c. 50.; 29 Geo. III. c. 58.; and ſo much of the 15 Cha. II. c. 7., as prohibits the buying of corn to ſell again, and laying it up in granaries, when above certain prices, were repealed.

By this act, the maritime counties of England are divided into twelve diſtricts, and Scotland into four diſtricts, making ſixteen in the whole. The prices of grain at the corn exchange in London, being made to regulate the exports and imports of the firſt diſtrict, which comprehends the ports of that city, together with the counties of Kent, Eſſex, and Suſſex. And, in the other diſtricts, the particular market towns, at which the prices and quantities of grain actually ſold are collected, are ſtated in the act. The dealers in grain are directed to give in, on oath, weekly accounts of their actual ſales for that time, to the officer termed the inſpector of returns, who, from ſuch returns, is to make out an account of the general weekly average price of the whole diſtrict, which is to be tranſmitted to the collectors of the cuſtoms at the different ports within the ſaid diſtrict, by which the bounties payable on exportation are to be regulated.

And, at four different times in the year, as within the ſpace of ſeven days after the 15th of February, 15th of May, 15th of Auguſt, and the 15th of November, the receivers of corn returns, in each diſtrict, are to make up the average prices of corn within the ſame, from the laſt ſix weekly returns thereof, with the exception of oats, which is to be made up from twelve weekly returns, this quarterly average being ſent to the collectors of the cuſtoms at the different ports within the ſaid diſtrict, at ſuch periods as mentioned above, by which importation, and the duties payable thereon, are to be regulated for the following quarter.

But, in Scotland, the average prices of grain are not aſcertained from the actual ſales. The ſheriffs of the different counties, once in the month, convene juries for fixing the average price at which it is uſually ſelling, but the witneſſes brought forward produce no account of their actual purchaſes or ſales, only depoſing to what they believe from their own experience, and the opinion of others, to be the current prices. Monthly accounts of the average prices of grain within each county, are made from theſe, by the ſheriffs of the different counties, which are ſent up to the receiver of corn returns in the port of London, from which the receiver is to make up an average account for each diſtrict, and tranſmit it to the collectors of the ports within the ſame, which is to regulate the bounties upon exportation; and, at the above-named quarterly periods, he is to make up the average prices from the two laſt monthly returns, which are to regulate the duties payable upon importation for the following quarter.

But corn from abroad may be imported and landed at any time without payment of duties, provided it be warehouſed under certain regulations, but cannot be taken out of the warehouſe for home conſumption, until the low duties are paid, and ſuch other duties as are payable at the time, in the diſtrict where intended to be uſed; nor can corn of either foreign or home produce be conveyed coaſtways from the port of any diſtrict, where exportation is not permitted, at the time of ſhipping, to the ports of any diſtrict in which exportation is permitted.

And when the general average of the whole country exceeds the rates of import at the low duties, his majeſty, in ſuch caſe, the parliament not being ſitting, can, with the conſent of the privy council, ſuſpend the execution of the act ſo far as to prohibit exportation wholly, and permit importation at the low duties, ſuch permiſſion continuing in force three months; but this power does not extend to prohibiting the exportation of foreign grain warehouſed before.

Since the above act, other laws have been made for the further regulation of the trade in grain. In 1793, an act of indemnity was paſſed, the 33 Geo. III. c. 3. for putting a ſtop to the execution of the general corn law, by an order of council of the 9th of November 1792, prohibiting the exportation of home produce, and granting liberty to import corn from abroad, until the 1ſt of March 1793; and for further ſuſpending the ſaid law, by granting power to his majeſty and council at any time during the ſitting of the parliament, to permit importation and prohibit exportation.

And by the 33 Geo. III. c. 63., the general corn law of 1791 was altered, by the repeal of the clauſes for aſcertaining the average prices of corn in England, and ſubſtituting others of a ſimilar tendency in their ſtead. And further, by granting liberty to his majeſty and council, when parliament is not ſitting, to permit the importation of grain, and prohibit the exportation of home produce, when the general average of the whole kingdom exceeds the prices at which grain can be imported at the low duties from Ireland and the colonies of North America; namely, wheat, 48*s.* rye, 32*s.* barley, 24*s.* oats, 16*s.* Likewiſe, by allowing exportation with a bounty of 1*s.* 6*d.* when oatmeal is under 13*s.* *per* boll; prohibiting exportation to foreign countries, when above 14*s.* the boll.

The law of 1795, the 35 Geo. III. c. 4. paſſed the 13th February, ſuſpends the general corn law of 1791, by giving power to his majeſty, with the conſent of the privy council, to prohibit the exportation and permit the importation of all ſorts of grain from abroad, without the payment of any duties whatſoever. The act to be in force until ſix weeks after the next parliament has met.

In conſequence of a report of a committee of the houſe of commons, made in 1804, on which it appeared, that the price of corn from 1791 to the harveſt of 1803, though very irregular, and increaſed on the average greatly by the years of ſcarcity, has in common afforded a fair profit to the grower; but that, from the ſtimulus of the uſual high prices having increaſed induſtry, by which large tracts of waſte land have been brought into cultivation, which, joined to the two laſt productive ſeaſons, and other cauſes, have occaſioned ſuch a depreſſion in the value of corn, as may tend to the diſcouragement of agriculture, unleſs ſupported by the aid of the legiſlature. Accordingly an act was this year paſſed the 44th Geo. III. c. 109, for the purpoſe of regulating the importation and exportation of corn, and the bounties and duties payable on the ſame; and by which it was enacted, that from and after the 15th of November, 1804, ſo much of the act of the 31 Geo. III. c. 30. as regulates the prices at which Britiſh corn, grain, malt, meal, flour, and biſcuit, may be exported, except to Ireland, and at which corn from abroad, grain, meal, and flour may be imported, except from Ireland, and as fixes the duties and bounties payable thereon, be repealed. Further, that, by this act, the importation and exportation of grain, into and from England and Wales, be regulated by the average price of the twelve maritime diſtricts, and into or from Scotland, by the average price of the four diſtricts of it; and that the bounties and duties be regulated by ſchedules annexed to the act; that whenever the average ſhall be under the prices, at which corn may be importable into Great Britain and Ireland, from abroad, on the low duties, exportation ſhall be permitted from Great Britain to Ireland, &c.; and that the importation and exportation of corn into and from Ireland ſhall be regulated by ſchedules annexed to the act. The firſt ſchedule ſhews the prices, to which the ſcale of bounty is to attach on the export of corn, &c. and the prices at which the exportation is prohibited. According to which wheat may be exported when at or under 48s. the quarter, with a bounty of 5s.; rye at or under 32s. with a bounty of 3s.; peaſe and beans are exportable without a bounty, until at or under 35s.; barley, bear, or bigg, or malt made of barley, bear, or bigg, may be exported at or under 28s. with a bounty of 2s. 6d.; oats at or under 16s. with a bounty of 2s.; wheat, flour, biſcuit, &c. with a bounty of 1s. 6d. *per* cwt.; wheat meal, with a bounty of 1s. 3d. *per* cwt.; barley, bear, or biggmeal, with a bounty of 10d. *per* cwt.; and oatmeal, with a bounty of 1s. *per* cwt. But that when the price of wheat exceeds 54s. that of rye 35s. that of peaſe and beans 35s. that of barley, bear, or bigg, or malt made of them, 31s. and that of oats 19s. no export is to be allowed.

The ſecond ſchedule ſhews the prices, according to which high or low duties are to take place on importation. When imported from the province of Quebec, or the other colonies or plantations in North America, wheat under 53s. the quarter, is ſubject to the high duty of 24s. 3d. the quarter; at or above 53s. but under 56s, to the firſt low duty of 2s. 6d.; and at or above 56s. to the ſecond low duty of 6d.; rye, peaſe, and beans, under 35s. the quarter are ſubject to the high duty of 22s.; at or above 35s. but under 37s. to the firſt low duty of 1s. 6d.; and at or above 37s. to the ſecond low duty of 3d.; barley, bear, or bigg, under 26s. are ſubject to the high duty of 22s.; at or above 26s. but under 28s. to the firſt low duty of 1s. 3d.; and at or above 28s. to the ſecond low duty of 3d.; oats under 17s. are ſubject to pay the duty of 6s. 7d.; at or above 17s. but under 18s. the firſt low duty of 1s.; and at or above 18s. the ſecond low duty of 2d.; oatmeal, if under 16s. 6d. the boll of 140 lbs. avoirdupois, or 128 lbs. Scotch troy, is ſubject for every boll to the high duty of 8s.; at or above 16s. 6d. the boll, but under 17s. 4d. to the firſt low duty of 1s.; and at or above 17s. 4d. the boll, to the ſecond low duty of 2d. When imported from any other country abroad, wheat under 63s. the quarter is ſubject to pay the high duty of 24s. 3d.; at or above 63s. but under 66s. the firſt low duty of 2s. 6d.; and at or above 66s. the ſecond low duty of 6d.; rye, peaſe, and beans, under 42s. pay the high duty of 22s.; at or above 42s. but under 44s. the firſt low duty of 1s. 6d.; and at or above 44s. the ſecond low duty of 3d.; barley, bear, or bigg, under 31s. 6d. pays the high duty of 22s.; at or above 31s. 6d. but under 33s. the firſt low duty of 1s. 3d.; and at or above 33s., the ſecond low duty of 3d.; oats, under 21s., pay the high duty of 6s. 7d.; at or above 21s., but under 22s., the firſt low duty of 1s.; and at or above 22s., the ſecond low duty of 2d.; oatmeal under 20s. the boll, pays the high duty of 8s.; at or above 20s. but under 21s., the firſt low duty of 1s.; and at or above 21s., the ſecond low duty of 6d.

The third ſchedule ſhews the prices to which the ſcale of bounty attaches on the export of corn, ground corn, flour, or meal, malt, &c. from Ireland, and the prices at which the exportation is prohibited. When exported to any country abroad, wheat at or under 29s. 5d. the barrel Britiſh, is allowed a bounty of 3s.; rye, and likewiſe peas and beans, at or under 20s. 4d., a bounty of 1s. 10d.; barley, bear, or bigg, or malt made from them, at or under 16s., a bounty of 1s. 5d.; oats, at or under 10s. 2d., a bounty of 1s. 3d.; wheat flour, biſcuit, &c. a bounty of 1s. 6d. the cwt.; wheat, meal, 1s. 3d. the cwt.; rye meal, or flour, 9d. the cwt.; barley, bear, or bigg flour, 10d. the cwt.; and oatmeal 1s. the cwt. When the price of wheat exceeds 33s. 1d. the barrel, Britiſh; of rye, peas, and beans, 22s. 3d.; of barley, bear, or bigg, or malt made from them, 17s. 8d.; and of oats 12s. 3d., no exportation is permitted.

The fourth ſchedule ſhews the prices according to which the high or low duties are to take place on importation into Ireland.

By the act of the 45 Geo. III. c. 26. ſec. 3, paſſed in 1805, ſo much of the act of the 41 Geo. III. c. 36, as may enable the lord lieutenant of Ireland to prohibit the exportation from it for a limited time, ſo as not to endure longer than the expiration of ſix weeks, after the commencement of the next ſeſſion of parliament, corn, potatoes, and all other proviſions whatever, and to permit the importation of corn, &c. for ſuch limited time, without the payment of duty, and the ſaid act to be further continued in force until the 25th day of March 1806.

The act of the 16th July 1806, 46 Geo. III. c. 97. which is intitled, "An Act to permit the free Interchange of every ſpecies of Corn between Great Britain and Ireland," enacts that the bounty and duties payable on exportation and importation of all corn and grain, meal, flour, bread, or biſcuit, from Great Britain into any port or place of Ireland, or from Ireland, into any port or place of Great Britain, ſhall ceaſe and determine. Provided always that the perſon exporting ſuch articles declare before the chief officer of the cuſtoms that the corn, &c. is really intended to be exported to Great Britain or Ireland, as the caſe may be, on which certificates, &c. are to be given to the exporter as in other caſes of tranſmitting goods coaſtways, without any fee or perquiſite.

And by an act of the 19th February, 1807, the 47 Geo. III. c. 7. the above recited act is amended, it being enacted that the ſaid act, and the ſeveral clauſes and proviſions therein mentioned, concerning the exportation and importation of any ſort of grain or corn, meal, flour, bread, or biſcuit, from Great Britain to Ireland, or from Ireland to Great Britain was intended to extend, and is hereby declared to extend only to ſuch corn or grain, meal, flour, bread, or biſcuit, as is the growth, produce, or manufacture of Great Britain or Ireland reſpectively, and not to ſuch being the growth, produce, or manufacture of any other country or place.

It is obſerved by Mr. Mackie, in his excellent "Letters on the Corn Laws," after ſuggeſting many judicious amendments in the act of 1791, that the power of the crown in ſuſpending theſe laws without the conſent of parliament is a highly dangerous power, which renders them in ſome meaſure of no effect. He conceives that in all free countries agriculture, which is an object of the greateſt national importance, ſhould conſtantly be under the ſacred protection of ſtanding laws, leſt the cultivators of the ſoil ſhould not have their induſtry ſufficiently encouraged. And that at preſent, however deficient the caſe might formerly have been, when capitaliſts are always ready and on the watch to open the ports, and ſpeculate in the introduction of grain from abroad, importation ſhould never be permitted but with the greateſt precaution, nor exportation put a ſtop to contrary to the eſtabliſhed laws, except in caſes of abſolute neceſſity, when indemnity would be readily granted. Some method of counteracting this and other inconveniencies of a ſimilar kind he conceives to be eſſential. From the barriers which had been formerly ſet up, as a preventative of the importation of corn from abroad, being deſtroyed, by the repeal of the old laws and reducing the import duties, a change made by the law of the year 1773, has ariſen, he conceives, the inability of Great Britain to ſupply herſelf with corn the produce of her own ſoil.

"In proportion," ſays he, "as the country advanced in proſperity, the ſurplus quantity, after ſupplying the inhabitants, which uſed formerly to be exported, was gradually abſorbed by the increaſing population and luxury of the nation; and the law in queſtion, among other cauſes, giving a check to the further extenſion of agriculture, neceſſary to counterbalance the additional conſumption, the tide at laſt turned againſt the country, and a regular influx of foreign grain became expedient to ſupply the growing wants of the inhabitants."

The differences which took place in this way, are ſtrikingly ſhewn in the ſtatement given below from. Mr. Dirom, who remarks that no accounts have been preſerved concerning the exports and imports of corn, previouſly to 1697, or that, from the high duties, little trade of this nature was carried on; but that in the years from that period to 1700 incluſive, the amount of the exportation of the different ſorts of grain was 331,223 quarters; while the importation was only 8,948 quarters: that, in the courſe of the ten years from the laſt of the above periods to 1710, the amount of the annual exportation was 248,945 quarters; while the average of the importation only came to 442 quarters. That in one of theſe years (1709) more than half a million of quarters, and in the courſe of the whole, not leſs than 2,849,446 quarters were exported, while only 4,442 quarters were imported.

In the next ten years, from 1711 to 1720 incluſive, the average yearly exportation increaſed to 449,193 quarters; the average annual importation being only 71 quarters. The amount of the exportation of theſe ten years being nearly in a double proportion to that of the preceding ten, ariſing to 4 491,933 quarters; while the import was only 714 quarters.

In the ſubſequent ten years, from 1721 to 1730 incluſive, though from different circumſtances, much foreign grain was introduced in ſome of the years, the exports kept nearly up to the preceding equal period; the amount of the whole of them for theſe ten years being 4,479,683 quarters; the imports of the different kinds of grain being 732,692 quarters.

For the ten years, from 1731 to 1740 incluſive, the act of 1729 having given a check to foreign importation and promoted cultivation, the average annual exportation was 549,447 quarters; while the amount of the average importation was only 4,690: the whole export of the ten years being 5,494,471 quarters; and the whole import only 46,909 quarters.

For the ten years from 1741 to 1750 incluſive, on account of the great induſtry and exertion of the farmers, in conſequence of being releaſed from prohibitory and injudicious laws, the annual average amount of exportation roſe to the extraordinary height of 848,660 quarters; while the imports amounted only to 15,193 quarters. The exports in 1748 were 1,123,953 quarters, in 1749, 1,250,306 quarters, and in the following year the amazing amount of 1,667,778 quarters; the whole for the ten years being 8,486,602 quarters; while the imports of the ſeveral ſorts of grain were only 159,437 quarters.

But for the ten years from 1751 to 1760 incluſive, the exports declined, on the average, to 582,837 quarters; the imports, on the average, being 37,397 quarters. This reduction in the exports is ſuppoſed to have depended on the deficient crops of 1756 and that of the following year.

From about this period the commencement of the import ſyſtem ſeems to have taken its riſe, which has ſince been carried to ſuch an amazing extent.

The imports of the years 1763 and 1764 chiefly conſiſted of oats; but in 1765 they were different ſorts of foreign grain, chiefly wheat, amounting to 218,031 quarters; while the exports of the ſeveral ſorts of corn amounted to the extent of 457,730 quarters. In 1767 the vaſt amount of 907,420 quarters was imported, 500,000 of which were wheat; and on the average of the twelve years, from 1761 to 1772 incluſive, the annual exportation had ſunk to 370,703, the yearly importation having increaſed to 251,279 quarters.

Under the ſanction of the act of 1773, in 1774 the large amount of 926,174 quarters of grain were imported from abroad, one third being wheat or wheat flour; while the quantity exported was not more than 51,099. In 1775 the immenſe quantity of 1,163,407 quarters of foreign corn was imported, half of which being wheat and wheat flour, while the exportation only roſe to 191,007 quarters. On the whole, for the twelve years from 1773 to 1784 incluſive, the annual average importation came up to 578,358 quarters; while the exportation decreaſed to 267,182 quarters. The whole importation of this period being not leſs than 6,940,293 quarters of foreign grain; while only 3,206,184 quarters of grain of home growth were exported.

This reverſe in our corn trade, with the vaſt diſadvantages which are ſuſtained by it to the nation, are ſtill further ſhown by Mr. Mackie in the table of the exports and imports of all ſorts of grain, ſent from or brought into Great Britain, from the concluſion of the above period to the year 1793.

ACCOUNT of Exports and Imports of Corn into Great Britain, from 5th January 1785, to 5th January 1793.

					By ſurplus quantity of grain imported by Great Britain, in the 9 years above-mentioned, after deducting the quantity exported, being at the rate of 564,185 *qrs.* $\frac{9}{3}$ value 550,756$\frac{2}{9}$*l.* *per ann.*	5,077,668	4,956,804	13	8
	7,958,418	9,921,190	6	5		7,958,418	9,921,190	6	5

The ſame writer, after obſerving that the act of 1791 in ſome degree diſcouraged the importation of corn from abroad, by increaſing the rates or duties on it, which was a defect in the old laws, yet ſtill that ſtatute is far from a ſtate of perfection. A radical error had, he conceives, been committed in the outſet of the corn laws, which has never been removed, which is that of the relative regulating rates of exportation and importation for the different kinds of grain, not having been fixed for ſuch, proportionably to their real values, the labour and expence they ſtand the farmer in raiſing and bringing to market, as in ſuch inſtances he would be under the neceſſity of relinquiſhing the cultivation of any particular ſort of grain, ſo rated from the corn dealer, in conſequence being able to have almoſt a complete command of the home market, from his being capable of ſupplying it from abroad. This he contends is the caſe at preſent in regard to oats, as from various ſtatements he ſhews, that if the rate of importation for that ſort of grain had been regulated originally, "in proportion to the current values in 1670 and 1688, when the preſent ſyſtem of corn laws was firſt enacted," it ſhould have been in the following proportion. "As 28 *s.*, the average price of wheat is to 85 *s.* 4 *d.*, the import rate of wheat including the duty, ſo is 12 *s.*, the average price of oats, to 36 *s.* 6 *d.*, being the relative import rate at which oats ought to have been imported, including the duty; whereas the law allowed foreign oats to be imported at 17 *s.* 4 *d.* including the duty. This he ſhews to have continued ſtill the caſe with this ſort of grain, from which the culture has been greatly abandoned by our farmers; and a large importation of that ſort of corn, though much inferior to our own, rendered neceſſary, 5,362,921 quarters having been imported from 1785 to 1793 at the value of 4,863,599 *l.* 6 *s.* 4 *d.*

It is concluded on the whole, that as the "wealth of nations varies conſiderably at different times, ſo ought the rates which regulate the export and import of foreign corn; if theſe affect the money price of our own produce in the home market, and tend to ſink its relative value below the current price of labour, with which it muſt always bear a juſt and neceſſary proportion, the rates muſt conſequently be raiſed in order to preſerve agriculture, the only ſolid baſis on which the real wealth and laſting proſperity of a ſtate can be founded." Should our induſtry and capital continue to increaſe for thirty years, in the ſame ratio it has done ſince the peace of 1783, the money in circulation, the price of labour, and the expence of cultivation may be double what it now is; and the price of corn will naturally increaſe in the ſame degree: ſhould the rates, at which corn from abroad is then permitted to be imported, have a tendency to obſtruct ſuch a riſe, he contends, that they muſt either be heightened or this country will loſe its agriculture, as has already happened in the caſe of oats; but that, on the other hand, ſhould the proſperity of the country decline, ſo as to leſſen the demand for labour, or the floating capital to one-half, the price of corn ſhould ſink in the ſame proportion, to the diminiſhed price of labour, and the import rates be lowered, if the means of preventing ſuch a neceſſary diminution. Conſequently, that, if theſe principles be well founded, a permanent law for the regulation of the export and import of grain, is inconſiſtent with ſound policy; it ſhould be ſuch as to expire regularly at fixed periods, according to the wiſdom of the legiſlature, on taking the ſituation of the country into full conſideration, ſo as to regulate it in conformity to the price of labour, which is "the moſt certain index of the growing proſperity, ſtationary ſituation, or declining ſtate of the nation."

In ſupport of which Mr. Malpus, in his late work on the "Principle of Population," obſerves, that in order "to reſtore our independence, and build our national greatneſs and commercial proſperity on the ſure foundation of agriculture, it is evidently not ſufficient to propoſe premiums for tillage, to cultivate this or that waſte, or even to paſs a general incloſure bill, though theſe are all excellent as far as they go. If the increaſe of the commercial population keep pace with theſe efforts, we ſhall only be where we were before, with regard to the neceſſity of importation. The object required is, to alter the relative proportion between the commercial and the agricultural population of the country, which, he thinks, can only be done by ſome ſyſtem, that will determine a greater proportion of the national capital to the national land." And he "ſees no other way at preſent of effecting this object, but by corn laws adapted to the peculiar circumſtances of the country, and the ſtate of foreign markets." Theſe are ſtated as the leading principles and circumſtances which are neceſſary to be particularly had in view in the framing of laws for the regulation of the trade in corn.

Corn, in *Surgery*, is a hard, dry, cuticular, warty, or horny induration in the ſkin, and ſometimes alſo in the ſubjacent cellular membrane. In the former caſe, the induration may be moved backwards and forwards; but in the latter, it is immoveable. Corns are in general not larger than about the ſize of a ſmall pea, and are produced in conſequence of external preſſure, eſpecially in ſuch parts as are expoſed to much friction, and where the ſkin is very near to the bone. They are, therefore, moſt generally found in the toes, or the ſoles of the feet; but ſometimes alſo in other parts, as on the upper ridge of the hip-bone, where they are produced by the preſſure of women's ſtays. Sometimes alſo ſimilar indurations are formed in the ears of women, who wear heavy ear-rings. When they are formed in the feet, they generally ariſe from the uſe of too narrow or high-heeled ſhoes, and ſometimes merely by wearing the ſtockings too tight. Frequently they produce no inconvenience; but ſometimes they become ſo painful as to render the patient entirely lame. The pain is increaſed by wearing warm ſtockings, tight ſhoes, violent motion of the body, ſtanding or walking too long, drinking ſpirituous liquors, and during variable weather. They are generally painful in hot weather, but rarely ſo in cold.

With reſpect to the cure, the ſurgeon may either endeavour to remove the pain for a time, or radically to free the patient from the diſeaſe. The violence of the pain may be immediately relieved, by the patient's ſitting down, taking off his narrow ſhoes, placing his foot in a horizontal poſition, and cooling it a little. A more permanent relief may be obtained, by ſhaving off the prominent part of the corn with a knife, as far as it can conveniently be got at, without, however, exciting any hæmorrhage, and by the uſe of emollient warm fomentations. The patient cannot be radically freed from his corns, unleſs he reſolves, during the progreſs of the cure, to wear no other than wide, ſoft, and low-heeled ſhoes, and to walk and ſtand as little as poſſible. If this is out of his power, and he is under the neceſſity of frequently walking or ſtanding for a conſiderable time, the preſſure may be prevented in the following manner: Take a piece of linen ſpread with ſome emollient plaſter; lay one piece over another, from eight to twelve times together, and cut a hole in the middle of them, exactly the ſame ſize and circumference as the corn; then apply it in ſuch a manner that the corn enters the hole in the plaſter, and is thus defended againſt the contact of the ſtockings and ſhoes. When ſuch a plaſter has been worn for the ſpace of ſome weeks, the corn, if recent, generally diſappears without requiring any other remedy. When the corn is ſituated in the ſole of the foot, we need only cut a hole into a felt-ſole, ſo as to fit the corn, and introduce it into the ſhoe.

By the following treatment, corns may be removed with certainty, radically, and ſpeedily, eſpecially if we employ at the ſame time the perforated ſole or plaſter: Rub two or three times a day an emollient liniment, ſuch as the ointment of althæa, or, which is ſtill better, the volatile liniment, upon the corn, and keep it covered during the intervals with an emollient plaſter. Every morning and evening let the foot be kept for half an hour in warm water, and the corn well rubbed with ſoap. Let the external part of the corn, which will have become perfectly white, ſoft, and pulpy, be then ſcraped with a blunt knife, till all the ſoft part is removed, and till the operation begins to give pain to the patient; upon which, we muſt immediately deſiſt. This treatment is to be continued till the corn is entirely extirpated; for if we deſiſt from it earlier, the corn will grow again. However, we muſt take care not to cut the part with the knife, ſo as to make it give pain or bleed.

Amongſt a variety of remedies that have been recommended for corns, the following are the principal: green wax, ſoap plaſter, diachylon, mercurial or hemlock plaſter, a piece of bacon, the juicy pulp of a freſh lemon, and even a piece of green oil-cloth, &c. which are to be changed as often as may be neceſſary. The following remedies have alſo been recommended as infallible: ℞ Gumm. ammoniac. Cer. citrin. aa ℥ij Aerug. æris ʒvj. M. F. Emplaſtr. S. To be ſpread upon linen and applied to the corn. Or, ℞ Empl. de galbano, de ammoniac. diachyl. comp. aa ℥ſs. Camph. ℈ij. M. F. Empl. D. S. To be ſpread pretty thick upon linen, and applied to the corn, in pieces juſt ſufficiently large to cover it. In order to aid the operation of the remedy, we may previouſly ſoften the corn in warm water, and ſcrape off as much of it as we are able. The following plaſter has been ſaid to produce the ſeparation of the corn within three or four days: ℞ Gumm. galban. ℥j. in aceto diſſolut. & ad ſpiſſitudinem evaporat. Add. Picis naval ℥ſs. Empl. diach. ſimpl. ʒij. In fine, Sal. ammon. virid. Aeris pulveriſ. aa ℈j. M. F. Empl. The exciſion of the corn is not to be recommended as a radical method of cure, both on account of the difficulty and danger with which it is attended, and becauſe it ſometimes proves unſucceſsful. When the patient has got rid of his corns, he muſt avoid all the abovementioned cauſes which tend to produce them, or they will again return.

Corns, in *Veterinary Science*, a troubleſome diſeaſe in the feet of horſes, moſt generally occurring in the fore feet, and in the inſide heel, within the angle or union of the quarter with the bar; though theſe bruiſes are ſometimes found in both quarters or ſides of the foot.

Terms improperly uſed in any art or ſcience render its acceſs more difficult, obſcure our views of it, and retard its advancement: ſo the term *corns* is, in this caſe, a groſs miſapplication of words, creating perplexity and miſconception, and which actual experience even in the diſeaſe is hardly ſufficient to do away.

When the ſkin of the human foot is gradually compreſſed or rubbed, without any ſudden and violent irritation that ſhall raiſe the cuticle or create a ſore, it thickens firſt, then becomes horny, and is rightly enough termed a corn, from *cornu*, Lat. or *corne*, Fr. *horn*.

In the horſe, on the contrary, whoſe foot is every where thickly clothed with natural horn, ſuch an occurrence, if it were poſſible, could not be a diſeaſe; but if a bruiſe takes place in the foot, at the point above deſcribed, it is alſo called a *corn*, though agreeing in nothing with the former diſeaſe, but in the common circumſtance of its affecting the foot with pain and lameneſs.

Where a corn, as it is called, exiſts in the foot, it is known by a redneſs, more or leſs intenſe, in the angle formed by the union of the bar with the ſides of the foot, and is moſt generally obſerved, as we have already ſtated, in the inner quarter: it is tender, if preſſed upon, producing lameneſs; and if the irritation is carried far enough, it feſters, and the pus, being prevented eſcaping below by the ſole, forms a paſſage inſide the hoof upwards, through the foliated ſubſtance or elaſtic proceſſes, to the coronet; and if a ſhoe, preſſing too hard upon the part, continues to be uſed, the irritation being kept up for a long time, the part becomes weakened in its function, not forming good ſound horn, and a painful diſeaſe is created, which is eradicated with difficulty, and is liable to return, after relief has been obtained, by the ſlighteſt renewal of this permanent preſſure, or of irritation of any kind.

Having briefly deſcribed the diſeaſe, as it commonly appears, we proceed to conſider its cauſe, and the cure.

As it is unequal preſſure that produces corns, even in ſtrong feet, from the ſhoe bearing too hard upon the point of the foot above indicated; ſo, in feet naturally weak, a ſlighter degree of preſſure, if the preſſure be permanent, ſhall be ſufficient to induce it: ſo that the diſeaſe may be obſerved in all ſorts of feet, but far more frequently in weak ones, as in low heeled feet, or where the heels project very much, and the horn turns under, and is thin.

The horſe's foot, we may remark, by being continually bound by the nails which attach the ſhoe to the foot, is ever hardening and diminiſhing in its volume, under their influence and preſſure, and eſpecially all the elaſtic parts of the foot, which, not being then called into much action, become inert and rigid, or are abſorbed; the poſterior parts of the foot, in particular, are deranged by it, and, in its contracting the foot, often forms waving lines of horn, which turn under at the heels, ſo that the ſhoe will take its bearing on the parts ſo diſpoſed, in a direction tending inwards, and bring on bruiſes and weakneſs, or *corns*, as the ſmiths have been pleaſed to call them.

The inflammation induced by the bruiſe or preſſure occaſions an increaſe, or ſometimes rupture, of the blood-veſſels of the part preſſed on, ſo that inſtead of lymph, the red parts of the blood flow into them: and hence that redneſs in the horn of the bruiſed part, the external indication of this diſeaſe.

If the preſſure be ſpeedily and effectually removed, and all external irritation be kept away, healthy horn forms again, and the diſeaſe diſappears; but if the irritation be kept up for any length of time, or has been attended with much violence, the vaſcular parts go on to ſuppurate; and the pus, as we have obſerved, forces its way with great pain to the coronet. Its frequent recurrence leaves the parts very weak, and the ſmiths are then apt to imagine it is natural to them, and convey this idea to others, and ſeldom admit the real cauſe of the diſeaſe.

One circumſtance, we believe not much underſtood, it is of importance to diſcloſe here, reſpecting the production of this diſorder, and which cannot be too generally known and conſidered, as it may be the means of warning thoſe whoſe experience has not yet informed them of the danger: it is this, that if we make a perpendicular ſection of the horſe's foot, acroſs the two points of the heel, where the corns uſually are found, it will be obſerved that the outſide and inſide heels exhibit different appearances: the vaſcular parts lying much lower on the inſide than on the outſide quarter; ſo much ſo, that any one holding the foot from the ground, and levelling the ſole to his eye with his drawing-knife or buttreſs, he would meet with the blood of the inſide quarter before he had brought it to what he would conceive the proper level of the outer, and before he at all ſuſpects it; for the horſe's foot, no doubt for the wiſeſt purpoſes, is not made a regular cone, as on a careleſs inſpection we ſhould apprehend it to be, but is placed inclining on the ground, with the inſide the higheſt, forming a ſpecies of rhomb or lozenge; the inner parts being thinner in horn, more elaſtic, and fleſhy; while the outer are ſtouter in horn, and with leſs vaſcular matter, and more adapted for receiving the wear, which, we may obſerve, takes place primarily on the outer ſide of the toe or pince, as may be ſeen by looking at the ſhoes when taken off, or obſerving the wear of the natural foot unſhod; and thus compreſſion and uneaſineſs are prevented by the greater yielding and elaſticity of the inner quarter and the heels: for had the foot been on every ſide equally unyielding, reſiſtance, compreſſion, and pain, under heavy burdens, or great or long continued exertions of the animal, would have been produced.

It is this difference which may deceive the ſmith, and make him bring the ſhoe nearer the quick on this quarter than he intends; and it is the ſuperior elaſticity and vaſcularity of his fore feet that occaſions them to be more the ſubjects of this diſeaſe than the hind, where corns rarely occur, and which we have heard the ſmiths attribute to the cauſe of their ſtanding with their hind feet in the dung of the ſtable.

The poſition, alſo, in which the ſmith is obliged to hold the foot between his thighs, turned upwards, and drawn away from the horſe outwards, will tend to increaſe his deception, in regard to theſe circumſtances of the apparent levelling of the hoof; and where there is a weak, low, fleſhy heel, as it is termed, a ſlight miſtake is ſufficient to produce a bruiſed heel, or corn, which in ſtouter feet it would be more difficult to do; though in theſe we ſometimes find it has been done.

A ſhoe too narrow for the foot, or with the heel made very ſloping inwards, would alſo induce a bruiſe of theſe parts; for we ſee, by the brightneſs of the ſhoe at this part, after it has been on ſome time and removed, that the nails do not entirely prevent the motion of the heels on this ſurface.

Finally, a ſhoe not equally fitted to bear alike on all the parts of the foot, but bearing on the toe and heels only, eſpecially the inner heel, and not taking ſufficient preſſure at the quarters, would, by this partiality of preſſure, induce inflammation and pain. Clenching the nails too forcibly near the heel, ſo as to induce more preſſure there than at the toe, would alſo do the ſame thing. Under the article FARRIERY, we propoſe conſidering ſome other parts of this ſubject, having barely inſerted enough of that branch of the buſineſs here as may be ſaid particularly to belong to this ſubject.

If this reaſoning, therefore, be true, the corn ariſes from the weakneſs and inſufficiency of the foot to bear the preſſure of a nailed ſhoe, or from partial and ill diſpoſed preſſure in the ſtrong feet, or improper paring: therefore the ancients, who, we believe, knew nothing of this nail ſhoeing, had not their horſes ſubject to this diſeaſe; and ſuch, on examining their writings, turns out to be the fact: for though they have deſcribed, and often moſt truly, the diſeaſes of the horſe, they have not deſcribed this diſeaſe, ſo as for us to conclude on its identity. The "Pulmunculus ad aperturam" of Vegetius, lib. ii. cap. 56. has ſome of the characters of the corn; but it is not clear whether oxen or horſes were the objects of it, and he recommends unſoleing for it: whatever it is, it was probably a diſeaſe ariſing from a weak heel, which, by long journies or rough roads, might be ſo bruiſed as to bring on ſimilar conſequences.

Having treated of the appearance of the corn and its cauſes, we have now to conſider the remedy, firſt obſerving that prevention from it is ever the wiſeſt line of conduct, eſpecially in a diſeaſe where the mechanical cauſes of it are obvious, and can be prevented. Where the corn or bruiſed heel has taken place, the firſt and moſt natural ſuggeſtion is to remove the ſhoe, and take away all the red diſeaſed horn with the drawing knife, ſo as, on the re-application of the ſhoe, to remove all preſſure from the part, and thus admit a new growth of horn not ſubject to external preſſure. For this purpoſe, the horſe may be turned to graſs during its growth, when in general it will grow down apparently perfect: it is, however, if the diſeaſe has been of any duration, too apt to return, if the ſmith brings only the ordinary preſſure of a ſhoe upon it; though this takes place by degrees, and not at the firſt ſhoeing: the parts weakened by the diſeaſe become unable to ſuſtain even this preſſure, and firſt become tender, and afterwards lame; or the parts feſter, according to the degree of it. The barred ſhoe, on this account, is often had recourſe to by the ſmiths with good ſucceſs; the preſſure to the corn being done away by the parts of the ſhoe oppoſite it being bent out of the line or plane of the ſhoe, and then to the foot a light ſtopping of turpentine dreſſings on tow is applied, and bound in with tar ckord. The continuance of this, which is ſeldom perſiſted in long enough, reſtores the horn to ſoundneſs; which being then left off, and the ordinary ſhoe applied, induces again the conſequences, ſooner or later, that we have deſcribed. A ſhoe may be beat or filed out with a ſpace oppoſite the corn; but we have found it more eaſy and certain, when the parts are arrived at this ſtate, to make a ſhoe rather thicker than the ordinary ſhoe, and to cut off entirely that extremity of it that comes oppoſite the corn, to a ſhort diſtance from it, ſo as to be aſſured no preſſure can ariſe from the ſhoe itſelf; for if the ſhoe be left long, however managed, by long wear it is apt to play and become relaxed, from the parts both of the hoof and ſhoe giving way to each other, and thus creating a degree of looſeneſs, when the heel of the ſhoe, coming upon the part, reproduces the diſeaſe. It will be objected to this propoſal, that the corn is left unprotected, and at firſt it will be a little tender, but this will ſpeedily go off, and at each ſhaving will become of leſs conſequence; and it is better of the two evils to contend with the occurrence of accidental preſſure from irregularities in the road, than the perpetual preſſure of the ſhoe. In ſlight caſes, after the ſhoe has been nailed on pretty firmly, we have taken a ſmall ſaw, and ſawed away the horn reſting on the ſhoe at this part, ſo as to make it preſs leſs there than on any other part of the foot; but if the ſhoe be allowed to ſtay on too long, the nails, as we before ſtated, become relaxed, by the horn giving way, and preſſure will occaſionally take place on the corn.

Of late we have had ſeveral opportunities of uſing the ſhoe above deſcribed, and have found it in practice beyond our expectation; nor have we found it, though avowedly imperfect, produce any of the ills we had apprehended it would be ſubject to. There are other methods than thoſe we have deſcribed, but we do not mention them, from finding them inſufficient. Where pus has formed, the horn covering it being effectually removed, digeſtives of turpentine are uſed, as in any other wound, till the horning of the ſore takes place, when the cauſe that originally produced it muſt be carefully avoided.

CORN-*Bottle*, in *Agriculture*. See CENTAURY and WEED

CORN-*Butterfly*, in *Entomology*. See PAPILIO.

CORN-*Crowfoot*, in *Agriculture*, is the common name of a plant of the weed kind, often found among corn crops, and which is very troubleſome to the farmer. It has an upright ſtem, with pale green leaves, cut into long narrow acute ſegments, the flowers are of a pale colour. It is extremely difficult to be eradicated from places where it is eſtabliſhed. See WEED.

CORN, *Ears of*, in *Natural Hiſtory*. Under this name different authors have deſcribed a variety of organic remains found in the ſtrata of the earth. M. Scheuchzer, in particular, gives the figure of a foſſil, which he deſcribes as an ear of corn, and from its figure, and ſuppoſed fulneſs, he argues, that the Moſaic deluge took place in the month of May! but Mr Walch conſiders this body rather as a zoophyte, the rays of which are divided by tranſverſe lines, marking their ſeparation into diſtinct vertebra.

The ſpica ſecalina, and graminis panici of Dr Richardſon, and the ear of barley which Mylius has figured, are of like doubtful origin; the latter, in particular, does not bear the proportions of an ear of barley.

The ſtangengraupen of the German mineralogiſts more nearly reſemble ears of corn, than the above. Theſe are flat, oblong, blackiſh, and ſometimes greeniſh bodies; but, becoming white, and acquiring a metallic luſtre on their prominent parts by friction. Many have ſuppoſed theſe to be mineral ſubſtances, to which mere accident has given their preſent form; but they ſeem to be real vegetable ſubſtances, impregnated with metallic particles. They vary conſiderably in form, but are in general flattened, and are ſtudded with little round prominences, bearing very much the appearance of corn. They are found but very rarely, and perhaps only in the copper mines of Frankenburg in Heſſe. M. Lihman, who has written expreſsly on theſe ſubſtances, does not conſider them as changed vegetable ſubſtances, but as being of mineral origin; he found them to conſiſt of copper, arſenic, ſulphur, and iron, with a ſmall quantity of ſilver in their compoſition. Wolfart, who has delineated and deſcribed theſe ſubſtances, calls them *frumenti metallares*, acknowledging that he cannot refer them to any particular ſpecies of grain. Mr. Parkinſon gives two figures of theſe ſubſtances, but concludes his deſcription thus: "I am therefore of opinion, that we muſt be ſatisfied with conſidering them as foſſils, whoſe origin muſt be referred to ſome hitherto unknown ſubject of the vegetable kingdom." Mr. Whitehurſt, "Theory of the Earth," p. 169. mentions corn among the vegetable impreſſions found in the coal meaſures of Derbyſhire; but this is doubtleſs as ill-founded as any of the foregoing; and we have the beſt reaſon to ſuppoſe, that minute and ſcientific examinations will place all theſe among the incognita of a former ſtate of aquatic exiſtence.

CORN-*Farm*, in *Agriculture*, is that ſort of farm which is principally cultivated and conducted under the ſyſtem of corn, or the chief produce of which is grain. All the more dry ſorts of land are adapted to this purpoſe. See CORN and FARM.

CORN-*Flag*, in *Botany*. See GLADIOLUS.

CORN-*Flag*, in *Agriculture*, is the name of a troubleſome plant of the weed kind, which increaſes greatly by the root; when eſtabliſhed in the field, it is with difficulty extirpated, as it is capable of ſending up new plants from every part of its roots. See WEED.

CORN, *Indian*. See INDIAN *Corn* and MAIZE.

CORN *Land*, that kind of land which is adapted to the growth of grain. See FARM.

CORN, *Lent*, is a term applied to that ſort of grain which is uſually ſown, or put into the ſoil about that ſeaſon.

CORN *Marygold*, is the name of a plant of the weed kind, of which there are two ſpecies, one found commonly in arable land, and the other in paſtures of the more moiſt kind. It is a great enemy to all ſorts of corn crops. It is extirpated with much difficulty, as it multiplies both by its roots and ſeeds. Deep and effectual hoeings, frequently repeated, are of courſe requiſite, before it runs up to ſeed. See WEED.

CORN *Meaſure*, in *Rural Economy*, that ſort of meaſure which is uſed for grain. See MEASURE, and WEIGHTS and MEASURES.

CORN *Mill*, that ſort of mill which is employed in the grinding of corn. See MILL.

CORN *Parſley*, in *Agriculture*, is the name of a low branching plant of the weed kind, often met with among corn crops. See WEED.

CORN *Rent*, that ſort of rent which is regulated by the price of grain. See RENT.

CORN-*Rents*, in *Law*, denote thoſe third parts of the old rents on college leaſes, which were to be reſerved by the leſſees. Stat. 18 Eliz. cap. 6. Theſe were the invention of lord-treaſurer Burleigh, and ſir Thomas Smith, then principal ſecretary of ſtate, for upholding the revenues of colleges.

Theſe great ſtateſmen, obſerving how much the value of money had ſunk, and the price of all proviſions riſen, by the quantity of bullion imported from the new-found Indies, which effects were likely further to increaſe, deviſed this method. Their foreſight and penetration have in this reſpect been very apparent; for though the rent ſo reſerved in corn was at firſt but one-third of the old rent, or half of what was ſtill reſerved in money, yet now the proportion is nearly inverted; and the money ariſing from corn rents is, *communibus annis*, almoſt double to the rents reſerved in money.

CORN-*Rocket*, in *Botany*. See BUNIAS.

CORN-*Sallad*, in *Agriculture*, a ſpecies of the Valerian. See VALERIAN.

CORN-*Sharping*. See SHARPING.

CORN, *Spring*, a term ſignifying ſuch ſorts of grain as are put into the earth in the ſpring ſeaſon.

CORN-*Stand*. See STAND.

CORN-*Stubble*, that ſort of ſtubble which remains after reaping or cutting any ſort of grain crop. It ſhould conſtantly be collected for the purpoſe of litter. See STUBBLE.

CORN-*Stubble Rake*, is a large kind of horſe-rake, employed in ſome counties with much benefit. See RAKE.

CORN-*trug*. See TRUG-*corn*.

CORN-*violet*. See WEED.

CORN, *white*, a general term uſed to ſignify all ſorts of grain.

CORN-*Worm*, a ſort of inſect of the caterpillar kind, which is ſaid to be very detrimental to corn.

CORNA, in *Ancient Geography*, an epiſcopal town of Aſia, in Lycaonia, mentioned in the acts of the council of Chalcedon, held in 451.

CORNA, in *Geography*, a town of Aſiatic Turkey, in the Arabian Irak, on the Euphrates; 6 miles N. W. of Baſſora.

CORNACHINE POWDER, in *Pharmacy*, a purging powder,

der, called alſo earl of Warwick's powder, and pulvis de tribus. It is compoſed of equal parts of antimonium diareticum, diagrydium, and cream of tartar.

CORNACHINI, Thomas, in *Biography*, born at Arezzo, in Tuſcany, about the middle of the 16th century, obtained conſiderable celebrity, as profeſſor of medicine at Piſa, where he lectured to large audiences ſeveral years. He died in 1625, and was ſucceeded in the profeſſorſhip by his ſon Mark, who publiſhed at Venice, in 1607, in fol. "Tabulæ Medicæ," the only work left by his father, in which he has collected the deſcriptions and accounts of diſeaſes left by the Greek and Arabian phyſicians, with commentaries upon them. His ſon had the credit of giving his name to a purging powder, Pulvis Cornachini. conſiſting of calomel, ſcammony, and burnt hartſhorn, which ſtill retains its credit, for its efficacy in deſtroying the aſcarides, a ſmall worm, infecting the bowels of children. Mark alſo publiſhed, "De Hominis Generatione, de vino, et aqua, balneiſque Piſanis," Franckfort, 1607. fol. and a "Diſcovery on the Method of Curing, tuto, cito, et jucundé," he ſays, all thoſe diſeaſes, which are ſaid to be derived from peccant humours. Haller Bib. Med. Eloy Dict. Hiſt.

CORNACUM, in *Ancient Geography*, a town of Lower Pannonia, according to Ptolemy and Antonine's Itinerary.

CORNAGE, an ancient tenure, the ſervice whereof was to blow a horn, when any invaſion of the Scots was perceived.

This tenure, which was a ſpecies of grand ſerjeanty, was very frequent in the northern counties, near the Picts and the Roman walls; but by ſtat. 12 Car. II. all tenures are converted into free, and common ſocage.

An old rental calls *cornage, neatgeldt*, q. d. *neat-geld.* Lord Coke ſays, in old books, it is called HORNGELD.

CORNARISTS, in *Eccleſiaſtical Hiſtory*, the diſciples of Theodore Cornhert, an enthuſiaſtic ſecretary of the ſtates of Holland. He writ at the ſame time againſt the Catholics, Lutherans, and Calviniſts. He maintained that every religious communion needed reformation; but he added, that no perſon had a right to engage in accompliſhing it, without a miſſion ſupported by miracles. He was alſo of opinion, that a perſon might be a good Chriſtian, without being a member of any viſible church.

CORNARIUS, John, in *Biography*, a phyſician of great eminence, and author of numerous treatiſes on the theory and practice of medicine, was born at Zwickaw, in Upper Saxony, in the year 1500. Haller ſays, his proper name was Haguenbot or Hanbut, but that following the cuſtom of the time, he took the name of Cornarius, which he affixed to all his publications. He is ſaid to have attached himſelf to the ſtudy of medicine, in the hope of diſcovering ſome method, or medicine, capable of reſtoring, or invigorating his conſtitution, naturally feeble and delicate. With this view, he reſided in ſucceſſion, at ſeveral German univerſities, and at length at Baſle, in Switzerland, where he met with copies of Hippocrates, Ætius, and other of the Greek fathers, in their own language, which he had not before been able to procure. Returning with this treaſure to his own country, having previouſly taken the degree of doctor in medicine at Padua, he ſet himſelf down to tranſlate firſt the works of Hippocrates into Latin, which he completed in five years, and publiſhed at Baſle, in folio, in 1543; then Ætius, and Paul of Ægina. He had before publiſhed, *viz.* in 1529. "Univerſæ rei medicæ, epigraphe, ſeu enumeratio," which has been ſeveral times reprinted. "De rectis medicinæ ſtudiis amplectendis" "De conviviorum veterum Græcorum;" "De peſte libri duo; de Podagræ laudibus," in 1553, with various other diſſertations. While thus employed, he did not neglect the practice of medicine, of which he is ſaid to have had a conſiderable portion. His tranſlations of Hippocrates, having been rudely attacked by Fuchſius, he anſwered it by a ſatyrical effuſion, which he called, Vulpecula excoriata. This was printed at Franckfort in 1543, in 4to. Fuchſius anſwered this by a ſimilar piece of ſatire, Cornarius furens. The tranſlation of Hippocrates has long ſince been ſuperſeded by thoſe of Vander Linden, and Fœſius, and thoſe of Ætius, and Paulus Ægineta, were not much longer lived. They were however works of great labour, and contributed to leſſen the difficulties of the taſk to thoſe that followed. Cornarius died at Jena, March the 16th, 1558. His ſon, Diomede, ſucceeded to his practice. He was appointed profeſſor of medicine, in the univerſity of Vienna, and phyſician to the emperor Maximilian II. He publiſhed at Leipſic, in 1595, in 4to. "Conſiliorum medicinalium tractatus;" alſo "Hiſtoriæ admirandæ raræ, et orationes medicinales." Haller Bib. Eloy. Dict. Hiſt.

CORNARO, Francis, cardinal and biſhop of Breſcia in the ſixteenth century, began his career as a military man, during the conteſts in Italy excited by the rival intereſts of Charles V. and Francis I. in which the Venetian republic was involved. Upon a general pacification, he quitted the army and devoted himſelf to the purſuits of literature and the ſtudy of politics. He was afterwards fixed upon as ambaſſador from the republic to the emperor Charles V. In 1527 he was raiſed to the dignity of cardinal by pope Clement VII. and after his admiſſion into the college, he confined his labours to the deliberations of that body, where his learning and experience were highly appreciated. He died in his ſixty-fifth year, A. D. 1543, of the gout, with which he had been long afflicted. Moreri.

Cornaro, George Basil, cardinal and biſhop of Padua, was born in 1658. He alſo began life in the army, which he left for the church. He was member of the order of Malta, and grand prior of Cyprus, an office which was hereditary in his family. His application to literature, and his acquirements by foreign travel, pointed him out as a perſon well and highly qualified to fill offices of great reſponſibility in the republic. He was firſt appointed to the ſuperintendency of the marine, and would have been ſent as ambaſſador to France, had not his preference led him to embrace an eccleſiaſtical life. He accordingly went to Rome, where he was entruſted with certain commiſſions which led him to high preferment and great dignities in the church.

In 1692 he was appointed ambaſſador to the court of Portugal, and was made titular archbiſhop of Rhodes. On his return, he was created cardinal by Innocent XII. and nominated to the biſhopric of Padua. He died in the year 1722. Moreri.

Cornaro, Lewis, of a noble Venetian family, though from his not enjoying the honours attached to it, ſuppoſed not to have been legitimate, was born in 1467. He lived to a great age, which he attributed, and probably with juſtice, to a ſtrict, abſtemious regimen, adopted by him, on his recovering from a ſevere illneſs, when he was more than forty years of age. His health had been declining ſeveral years, prior to this attack, owing as he acknowledges to his living a debauched and voluptuous life. In entering on his new regimen, he took care to avoid, he ſays, the extremes of heat, or cold, together with all violent exerciſe, and to live in a pure dry air; all which, he contended, were equally important in attaining the end propoſed, the reſtoration of a decayed conſtitution, as temperance and diet. During the remainder of his life, he only took twelve ounces of ſolid food, *viz.* bread, ſoups, yolks of eggs, and meat, and fourteen ounces of wine in the day. This portion, as he grew old, he rather diminiſhed than increaſed, obſerving that the power of concoction is then leſs vigorous, and as that weakens, the ingeſta ſhould be leſſened. He married a lady of the houſe of Spilemberg, at Udina, by whom he had an only child, a daughter, when they were both advanced in years. At the age of 83 he wrote his "Diſcorſi della vita ſobria:" a ſhort treatiſe on the advantages of temperance, from which this account is principally taken. The work has been repeatedly tranſlated, and printed in every country in Europe. He was then, he ſays, ſo briſk, lively, and active, that he could mount his horſe, without aſſiſtance from any riſing ground. Sometimes he retired to his villa, ſeated in a valley, watered by the Brenta, encircled with large, well cultivated fields, and a conſiderable number of buildings, made habitable by his own induſtry. "It had been full of fens and bogs, he ſays, a habitation, more fit for ſnakes, toads, and ſerpents, than for man." He had the pleaſure of enjoying the ſociety of his daughter and eleven grandchildren ſhe had produced; who amuſed him with their muſical exhibitions, in which ſcience as well as in that of architecture, he had no inconſiderable ſkill. He died at Padua, April 26th, 1566, at the age of 98. His wife, who ſurvived him, lived alſo to nearly the ſame age. Sir John Sinclair, in his "Code of health and longevity," mentions the edition of 1779 as the beſt Engliſh tranſlation of Cornaro's works. There are four diſcourſes on one ſubject, penned at different times; the firſt, which he wrote at the age of 83, is intitled "A treatiſe on a ſober life," in which he declares war againſt every kind of intemperance. The ſecond was compoſed three years after, and contains directions for repairing a bad conſtitution. The third he wrote when he was 91, entitled "An earneſt exhortation to a ſober life;" and the laſt is a letter to Barbaro, patriach of Aquileia, written when he was 95, which contains a lively deſcription of the health, vigour, and perfect uſe of all his faculties, which he had the happineſs of enjoying at that advanced period of life. Eloy. Dict. Hiſt. Gen. Biog.

Cornaro-Piscopia, Lucretia Helena, an illuſtrious Venetian lady, was born at Venice in 1646. At the age of eleven having imbibed a devotional temper, and an ardent love of literature, ſhe took a vow of chaſtity, which ſhe maintained through life, though a diſpenſation was obtained from it, without her knowledge. She was an excellent linguiſt, being thoroughly converſant with ſeveral of the modern languages and with the Latin, the Greek, Hebrew, and Arabic. She had a taſte for poetry and muſic, and compoſed verſes which ſhe ſung to her inſtrument. In many of the abſtruſe ſciences ſhe was deeply read, and acquired ſo much reputation, that it was propoſed to give her a ſeat among the doctors of theology at Padua; this was oppoſed by the biſhop; ſhe was however honoured with a cap of doctor in philoſophy. The ceremony uſed on the occaſion was performed in 1678 in the cathedral of Padua, at which an immenſe concourſe of people was aſſembled as witneſſes of ſo extraordinary a ſight. She was elected a member of all the principal literary ſocieties in Italy, and no perſon of diſtinction viſited the country without paying his reſpects to this excellent lady. She had a great deſire to enter into ſome religious ſociety; but by the entreaties of her father ſhe remained under his roof, contenting herſelf with wearing the habit of the Benedictine nuns, and obſerving the rules of the order. She died in the year 1684, and her works were collected and publiſhed in 8vo. at Parma, 1688, but their merit is not equal to the high reputation which the author ſuſtained during life. Moreri.

CORNAU, in *Geography*, a town of Germany, in the circle of Weſtphalia, and county of Diepholz; 6 miles N. of Diepholz.

CORNAVII, in *Ancient Geography*, a people of the iſle of Albion, who were ſituated to the weſt of the Coritani or Cor-Iceni, in that country, according to Camden, which is now divided into Warwickſhire, Worceſterſhire, Shropſhire, and Cheſhire. There were ſeveral Britiſh tribes of this name, in other parts of this iſland; and particularly in the moſt northerly part of Britain, called Strathnavern, which ſeems to retain ſome veſtige of the name of its firſt poſſeſſors; and they all ſeem to have been called Cornavii, from the two Britiſh words *Corn*, a horn, and *Av*, a river, deſcriptive of the form and ſituation of their reſpective countries. Beſides the Cornavii, there was another Britiſh tribe or nation, ſeated in the countries above mentioned; and ſeeming to have poſſeſſed the beſt part of the two counties of Warwick and Worceſter. This nation is called by Tacitus (Annal. l. xii. c. 38.) the Jugantes, by a miſtake as it is thought of his tranſcribers, for Wigantes, or Huicii, their real name.

The Wigantes, ſignifying in the ancient language of Britain, brave men, ſeem to have been an independent nation under their own prince Venutius, who married the famous Carteſmandua, queen of the Brigantes. But both the Wigantes and Cornavii, were in ſuch ſtrict alliance with the Iceni and Cor-Iceni, that they were reduced at the ſame time, and by the ſame generals, under the dominion of the Romans. (Tacit. Annal. l. xii. c. 29, 30.) That brave and induſtrious people built many forts, ſtations, and towers in the country of the Cornavii and Wigantes, to keep the inhabitants in ſubjection.

As the ſecond journey of Antoninus from beyond the wall of Severus to Richborough in Kent, paſſes through this country from north to ſouth, it will conduct us to ſeveral of theſe Roman towns and ſtations. The moſt northerly of theſe towns was Condate, ſuppoſed to be Northwich in Cheſhire. We come next to Diva or Deva, now Cheſter, which was a city of great conſideration in the time of the Romans, a colony, and the ſtation of the 20th legion. Purſuing the ſame route ſouthward, we meet with the following towns in their order; Bovium, near Stretton; Mediolanum near Drayton; Rutunium, near Wem; Uriconium, near Wroxeter, the ancient capital of the Cornavii; Uxacona, near Sheriff-Hales; Pennocrucium, near the river Penk; Etocetum, Wall near Litchfield; and Mandueſſedum, near Manceſter, in Warwickſhire. The preciſe boundaries of the ſeveral Roman provinces in Britain are ſo little known, that we cannot be certain whether the whole country of the Cornavii and Wigantes was within the limits of that which was called Britannia Prima, or ſome part of it belonged to Britannia Secunda.

CORNAX, Matthias, in *Biography*, a native of Meldola, a ſmall town in Italy, ſtudied medicine at Venice, where he afterwards continued to practiſe, and was appointed one of the teachers in the art. He is here noticed, on account of his having publiſhed a caſe of a woman who had carried an extra fœtus in the abdomen, for the ſpace of five years. An abſceſs at length forming, near the navel, and burſting, our practitioner enlarged the aperture, and extracted through the wound, a half putrid fœtus. The woman recovered, but becoming again pregnant, and it not being practicable to deliver her by the natural paſſage, ſhe died.

It does not appear that the body was opened. The caſe was originally publiſhed at Venice in 1550, in 4to, "Hiſtoria quinquennis fere geſtationis," &c. It was republiſhed in 1564, with other ſimilar caſes, in the author's "Enchiridion Medicæ conſultationis apud Ægrotos, &c; Baſiliæ," 8vo. Haller Bib. Ch.

CORNAZZANI, Anthony, an eminent Italian poet, who flouriſhed in the fifteenth century. He was born at Placentia. but reſided chiefly in the early part of life at Milan, but after the death of Sforza he was obliged to take refuge at Venice, where he was hoſpitably received by Bartholomew Colleone, whoſe life he afterwards wrote. From Venice he went to France, and from thence to Ferrara, where he finally ſettled under the patronage of Duke Hercules the firſt, and his ducheſs Lucretia Borgia. He is chiefly known by his ſonnets and lyric poems, ſome of which are reckoned the moſt perfect of their kind in the language. He wrote the lives of the Virgin Mary and of Chriſt in verſe; and among his proſe works, we have, beſides the life of Colleone, a treatiſe "De Mulieribus admirandis;" and another entitled "De excellentum Virorum principibus."

CORNE, or Corna, in *Ancient Geography*, a town of Cappadocia, towards the Euphrates, to the ſouth of Melitene.

Corne, in *Geography*, an iſland, ten miles long and one wide, in the gulf of Mexico, near the coaſt of Weſt Florida. N. lat. 30° 11′. W. long. 88° 32′.

Corne, a town of France, in the department of the Mayne and Loire; 7 miles E. of Angers.

Corne. See Horn-*work*.

Corne *a amorcer*, priming-horn. An ox-horn filled with fine powder for priming cannon.

END OF VOL. IX.

Strahan and Preſton,
New-ſtreet Square, London.
